REPORTS FROM COMMISSIONERS:

1868-9.

TWENTY-TWO VOLUMES:—CONTENTS OF THE

SECOND VOLUME.

N. B.—*THE* Figures *at the* beginning of the line, *correspond with the* N° *at the foot of each* Report; *and the* Figures *at the* end of the line, *refer to the* MS. Paging *of the Volumes arranged for The House of Commons.*

AGRICULTURE (EMPLOYMENT OF WOMEN AND CHILDREN):

[4202.] Second Report of the Commissioners on the Employment of Children, Young Persons, and Women in Agriculture, with Appendix. Part I. - - - - - - - - - p. 1

[4202-I.] Appendix. Part II. Evidence from the Assistant Commissioners - - - - - - - - - - - - 231

COMMISSION ON THE EMPLOYMENT OF CHILDREN, YOUNG PERSONS, AND WOMEN IN AGRICULTURE (1867).

SECOND REPORT

OF

THE COMMISSIONERS,

WITH APPENDIX PART I.

Presented to both Houses of Parliament by Command of Her Majesty.

LONDON:
PRINTED BY GEORGE EDWARD EYRE AND WILLIAM SPOTTISWOODE,
PRINTERS TO THE QUEEN'S MOST EXCELLENT MAJESTY.
FOR HER MAJESTY'S STATIONERY OFFICE.

CONTENTS OF THE REPORTS.

	Page
JOINT REPORT OF COMMISSIONERS	vii
Assistant Commissioners' districts of this year	,,
Course of proceeding	,,
Value of Assistant Commissioner's Reports	,,
Questions proposed for inquiry as to England now ready for legislation	,,
The Commissioners find it necessary to present separate reports	,,
MR. TREMENHEERE'S SEPARATE REPORT	viii
Subjects of inquiry	,,
General remarks	,,
The most prominent fact regarding the education question is the concurrence of opinion in many counties in favour of excluding from work all children under 10 years of age	,,
This is especially the farmers' view	,,
The question looked at from the labourer's point of view	ix
Even where fewest children are employed under 10 their exclusion might inflict privation	,,
But there are large districts where they are much wanted by the farmer, and where their earnings are important to their parents	,,
Counties where fewest children employed are those where the best labourers have highest wages	,,
Under such circumstances labourers in permanent employ ought not to regret the loss of children's earnings	,,
But even in those counties there are, below that class, the men not employed "wet and dry;" others of second-rate capacity; others only wanted occasionally	,,
To these their children's earnings are important	x
In such cases, if children should be excluded from work under 10 years of age, it is proposed to give aid to parents, or to give a dispensing power to magistrates	,,
The desire of the country with respect to education can be fulfilled without resorting to either	,,
The principle that should be kept in view is to interfere as little as possible with existing habits	,,
Special remarks with respect to counties where children's labour is much wanted both by farmers and parents	,,
Lincolnshire	,,
South Durham	xi
Cambridgeshire	,,
North and West Riding of Yorkshire	,,
Dorset	xii
Kent	,,
Cheshire	,,
Shropshire	,,
Staffordshire	,,
The fact that in some counties the labour of children under 10 years of age is but little wanted, and does not seriously interfere with school attendance, affords no sufficient justification for excluding from work all children under 10 in the numerous cases where their labour at that age is wanted both by farmers and parents	,,
Will such non-interference leave them exposed to physical injury, arising from work below the age of 10, and present serious obstacles to education?	,,
Early age of work, with some exceptions, produces no physical injury	,,
North Northumberland	,,
Lincoln	xiii
Nottingham	,,
Cambridgeshire	,,
Yorkshire	,,
Northamptonshire	,,
Beds, Bucks	,,
Oxford, Berks	,,
Dorset	,,
Kent	,,
Chester	,,
Salop	,,
Stafford	,,
Rutland	xiii
Other counties	,,
Exceptions alluded to above	,,
Boys with horses	,,
Dorset	,,
In Mr. Fraser's district	xiv
Kent	,,
Beds	,,
Bucks	,,
Oxfordshire	,,
Berkshire	,,
Limitation of age for boys with horses	xv
Should be fixed at 11 years	,,
Limitation has been suggested by some for private gangs	,,
Not necessary	,,
Difference between public and private gangs	,,
Private gangs confined to large farms	,,
Private gangs well regulated on large farms	,,
Question of legislative restrictions on the employment of women and of female children	xvi
Great varieties of opinion	,,
Legislation not necessary	xvii
Limitation proposed by some in regard to distance not necessary;	,,
Restrictions as to females weeding in high corn in wet weather, or as to meal times, not necessary;	,,
One species of employment which occasions moral injury to the young, namely "tenting" on Sundays	,,
Mr. Fraser's district	,,
,, Stanhope's district	,,
,, Boyle's district	,,
The habit general, and the children should be protected	,,
The same child should not be employed except on alternate Sundays	,,
No minimum age required below which it shall be unlawful to employ children in agriculture	xviii
The analogy of the Factory Acts, as to necessity for fixing a minimum age, not applicable	,,
Much reason for leaving them free to accept work when wanted for it	,,
Shown to be often indispensable to farmers, and often to parents, and	,,
Earnings, though small, often very acceptable	,,
But earnings not always small	,,
Minimum age advocated by some for the sake of schooling	,,
As not going to work does not necessarily imply going to school, Parliament is asked, to meet such cases, to devise some plan of compulsion	,,
But compulsory schooling without work only accepted in our legislation in one instance, and that not one to follow in this case	xix
It would throw the whole burden on the parent	,,
Such burden would be a ground in many cases to require that the parent should be aided in some shape	,,
Effect of, pauperising	,,
The only available principle is that of coupling the obligation of school attendance with wages-earning employment	,,
This rests on a sound view of parental obligation	,,
Public opinion would sanction the enforcement of this by fine and imprisonment	,,
Workshops' Act	,,
But public opinion would not sanction it unless parent derived benefit from the child's earnings	xx
The Prussian system does not take this into account	,,
Description of Prussian system	,,
Would not be tolerated in this country	,,
Fails even in Prussia, where confronted with the poverty of parents	,,
With these principles and these facts before me I approach the question of what is the proper measure for securing a due amount of elementary education to children engaged in agriculture	,,

Page

Statistics of, below 12 years of age according to census of 1861 - - - - - xx
Half-day and alternate days systems impossible „
Modification of Printworks Act the only solution practicable - - - - xxi
Particular modifications suggested by,—
Mr. Fraser - - - - - „
„ Henley - - - - - „
„ Stanhope - - - - „
„ Portman - - - - „
„ Norman - - - - - „
„ Culley - - - - - „
Suggestions by individuals referred to by the Assistant Commissioners - - - „
It has been shown that exclusion of all under any age is inadmissible, and that it is unnecessary to interfere with existing habits - - - „
Allowing employment of children to proceed as at present (with the exceptions mentioned), xxii
Solution of the education difficulty proposed - „
1. Every child employed in agriculture to be under the obligation to complete 160 school attendances in each year from first period of employment until 12 years of age - - „
Employment defined - - - - „
2. The school attendances to be reduced to 60 for any child of the age of 9 and upwards who passes in 4th Standard - - - „
3. Obligation of school attendance to cease altogether for any child who at the age of 11, or at the time between that age and 12, passes in 5th Standard - - - - „
Observations - - - - - „
160 attendances would require 80 days, 16 weeks, or 4 months - - - - „
80 days is less than some wish, but as much as can be spared in many important districts - „
But the examination proposed in 4th Standard is an equivalent - - - - „
Prospect of examination will be inducement to parent to send child to school at an early age „
The 80 attendances should be allowed to be taken at any time or times of the year - „
Irregularity of attendance the admitted defect of Printworks Act - - - - „
Regular attendance in winter proposed by some but winter occupation is in some districts as great as in summer - - - - „
Absence of rule enforcing regularity of attendance compensated for by the proposed examination - - - - - - „
If child of 9 passes 4th Standard, attendances reduced to 60 per annum until 12 - - „
May be taken at night school, in five months - - - - - xxiii
In day school in six weeks - - - „
When 4th Standard passed, child not likely to forget what it has learnt - - - „
But premium offered for going beyond 4th Standard - - - - - „
If any child at 11 or before 12 passes in the 5th Standard the obligation of school attendance to cease - - - - - „
11 the age when boys wanted for continuous work „
Girl at 11 can reach the 5th Standard. - - „
Passing in the 5th Standard would put a child's career in its own hands - - - „
Pecuniary effect of this proposal - - - „
Net gain to parent from 12 weeks' work and 16 school attendances, 15*s.* 8*d.* - - - „
From 24 weeks' work, 33*s.* 4*d.* - - - xxiv
This is an estimated value of labour from minimum standard of earnings - - - „
There need, therefore, be no hesitation on the part of the Legislature to enforce 160 school attendances up to 12 years, in the manner proposed - - - - - „
Looking at requirement of 160 school attendances in reference to age of child, if child has begun work at 6 it may complete 72 days work before 7.
Liability to school attendance then begins. If child has attended infant school from time to time, it will probably pass in 4th Standard at 9 - „
If child begins work at 7 it may have been at school longer, and will pass at 9 - - „
Interest of parents and employers that it should pass - - - - - - - „
Should therefore the legal responsibility attach to both? - - - - - - „

Page

It should attach only to parent - - xxiv
Parent should be required to prove school attendance of child - - - - - „
Mode of proving the fact of such school attendance - - - - - - xxv
Some administrative machinery required for all plans suggested - - - - „
The same administrative machinery that may be adopted to secure school attendance available with reference to certificates of examination - - - - - - - „
Certificate of having passed in Standards 4 and 5 - „
By whom to be granted - - - „
Under what securities - - - - xxvi
How to be obtained - - - - „
Must be always obtainable without delay - „
In schools under certificated teacher - - „
„ „ simple inspection - - „
In all other schools - - - - „
Certificated master to be liable to be called upon to examine for a small fee, if school within four miles from parent's dwelling - - „
Form of certificate - - - - „
Cost and selling price of - - - xxvii
Certificated teachers should be the medium of distribution - - - - - - „
Periodical examination not sufficient for granting certificates - - - - „
Only held in schools under Education Department - - - - - - „
Parent and employer's interest that certificate should be obtainable at any time, under the guarantee against abuse already pointed out - „
To prevent collision of interests between parent and teacher relaxation required in rule relating to attendances, and the fee should be increased on child passing in those standards - „
Employer to be liable as soon as continuous employment begins - - - - „
Probable satisfactory results if this plan should be adopted - - - - - xxviii
This anticipation depends on the passing of a general measure for the supply of good schools where wanted - - - „
Reasons why Government should have power to cause such schools to be provided after notice „
Action of plan of school certificates on passing in 4th and 5th Standards would be facilitated by any means which improved the resources of the agricultural labourer - - - xxix
We devoted much of our First Report to directing attention to some of the principal means by which earnings might be improved. Among other means, we adverted to the auxiliary resources towards improving both the moral and physical condition of the labourer, which existed in cottage gardens or field allotments - - - - - „
Value of these shown by Reports laid before Parliament from 1795 to present day - - - xxx
As it was on the Report of the Select Committee of 1843 that the General Inclosure Act was founded, we referred in our First Report to that Act, and to the Annual Reports of the Inclosure Commissioners - - - - - - - „
The Annual Inclosure Bill of this year referred to Select Committee - - - - xxxi
Recommendations made by that Committee - „
But any good results of increased pecuniary means, and of more and better education for the agricultural labourer's children, liable to be counteracted by the state, in very numerous cases, of his dwelling - - - - - xxxii
Efforts of late years made by landowners to improve and add to cottage accommodation - - „
But deficiencies still to be remedied of a very serious nature - - - - - - „
Description of agricultural cottages by Assistant Commissioners - - - - - „
It is sometimes argued that the influence of good cottages is overrated - - - - xxxvi
External circumstances may counterbalance their injurious influences - - - - - „
The action of the Legislature invoked by many persons, to facilitate the provision of good cottages - „
The different classes of estates and properties on which bad cottages are found - - - xxxvii
Question of enlarging power of borrowing for cottage improvement under the Act 27 & 28 Vict. c. 114. xxxviii

	Page
Possible effects of Nuisances Removal Act, if improved	xxxix
Possible effects should the principle of the Artizans and Labourers Dwellings Act (31 & 32 Vict. c. 133.) be extended to the rural districts	,,
The bearing of the questions arising out of the fact of so many estates being settled and incumbered, as referred to by the Assistant Commissioners, more clearly seen by reference to the whole course of legislation on that subject	,,
The origin of "Strict Settlements" is subsequent to the Restoration	,,
Circumstances out of which they arose	,,
Intentions of inventors of	,,
If system requires to be modified its modification would be in accordance with the course of legislation upon the subject from the earliest times to the present day	,,
Desirable to bring back the system of incumbering settled estates to the "reasonable and proper bounds" contemplated by its inventors	xli
Effect of "Landed Estates Court" in Ireland	,,
Similar or equivalent measure for England would cause fresh capital to be applied to the land, to the great benefit of the labourer	xlii
A return of the number of rooms per house, as well as the number of houses, desirable in the next census for England and Wales, after the example of the census of Scotland for 1861	,,
The question of benefit societies	,,
Great loss inflicted on the labouring classes by the present state of	xliii
Opinion of the Registrar General of Friendly Societies as to the alterations required	,,
Examples of sound benefit societies	,,
Difficulties in the way of forming such	xliv
Points suggested for inquiry	,,
Four classes of benefit societies distinguished by Registrar General	,,
Two of these classes may be aided by the Government	,,
The other two should be local and administered by local agency	,,
Inquiry would probably facilitate the formation of sound local societies	,,
Other topics of great interest included in reports of Assistant Commissioners	,,
Different modes of hiring	,,
Statute hirings	xlv
The dietary of the labourer	,,
Large and small farms	,,
These questions will receive further illustration from our inquiries in Wales and Scotland	,,
Mr. Tufnell's Separate Report	xlv
Limits of the province of government	,,
Proposals to cure every evil among the agricultural population by direct Government interference	,,
Proposals that wholly overstep the proper boundaries of legislation	,,
Past legislation full of futile attempts to cure, by Acts of Parliament, evils that had been observed to affect labourers	xlvi
Present legislation in respect of milliners, injures those that it was intended to benefit	,,
Principles, which it is justifiable by legal measures, to enforce with respect to the employment of children	,,
Mill's opinion on the limits of the province of Government	,,
Is the health of children injured by agricultural work?	,,
Are children cruelly treated?	xlvii
No restrictions on child labour required in Northumberland	xlviii
Are children employed in agriculture under-educated?	,,
The maximum school age has been lessening	,,
Difference between the nominal and real school life of children	xlix
Numbers of the agricultural class growing up without education	,,
Modes by which the deficiency of education can be supplied	,,
The half-time or alternate day system	l
Instances in which the half-time system has succeeded	l
Half-time as practised by Lord Rayleigh	,,
Half-time as practised by Sir P. Grey Egerton	,,
The experiment of Mr. Paget in Nottinghamshire	,,
Failure of the half-time system	,,
Success of the half-time system in pauper schools	li
Half-time system, as enforced by Act of Parliament in factories, of doubtful educational value	,,
Undesigned evil effect of the compulsory half-time system	lii
Effects of such a system in encouraging parental negligence	,,
Method of enforcing education by the Printworks' Act wholly nugatory	,,
Mr. Horner's opinion on the Printworks' Act as respects education	,,
Employers of child labour willing that all children should be prohibited from working up to the age of 10	,,
Labourers mostly concur in the opinion that 10 is quite early enough to send children to work	liv
System of indirect compulsory education, by requiring a certificate that the child has passed the Fourth Standard before it is allowed to work	lvi
Advantages of this system	lvii
The system is plausible, but unsound	,,
Who is to grant the certificate?	,,
The Privy Council inspectors might if they had time, which they have not	,,
The system would require an army of Government officials	,,
Effect of the certificate system on a stupid child	,,
Effect on a clever child	,,
Effect of giving a local authority power to grant the certificate	,,
Plan of a test examination tried in the Mining Act and failed	lviii
Further objections to pass examinations	,,
Mechanical effect of pass examinations, as shown by the Revised Code examinations	lix
The certificate system would be a retrogade step in education	,,
Minute and vexatious factory legislation	,,
Impossibility of manufacturers to understand what regulations are enforced upon them by Acts of Parliament	,,
Inapplicability of factory legislation to agriculture	,,
Agricultural children might be safely prohibited from working under 10 years of age	lx
Factory children may work at 8	,,
Commissioners of 1861 propose that Factory Acts should be revised, and that 8 is too early for a child to work	,,
Proposal to make a compromise between the factory age for work and the agricultural age, and prohibit all children working under 9	,,
This proposal may appear too timid, but there is a necessity of caution in commencing a general interference with child labour	,,
Instance of the impossibility of carrying out a law not supported by general opinion	lxi
Opinion of the late Prince Consort on this subject	,,
The prohibition of the age of working might be extended to 10 after a short period, and ultimately to 11 or 12	,,
Simultaneous with the above prohibition, a general system of education ought to be established, and without this the prohibition of age ought not to be enacted	,,
Effect of passing a general scheme of education in inducing the erection of schools voluntarily when wanted	,,
Schools are tolerably abundant, but improved ones wanted	,,
Compulsory education	lxii
Apathy of parents one of the main obstacles to education	lxiii
Inutility of compulsory education in Prussia and Switzerland	,,
Opinion of the Newcastle Commissioners on compulsory education	,,
No further interference required with agricultural gangs	,,
Insufficiency of cottage accommodation, cannot be remedied by the legislature	lxiv
Danger of over-legislation	,,
Mr. Henley's report on Northumberland	,,

	Page
Causes of the superiority of the Northumbrian labourer over the Southern	lxiv
If all England had been like Northumberland, this Commission would have been useless	lxv
There are no direct methods of curing by legislative enactment the numerous evils that afflict the agricultural population	lxvi
Increasing the intelligence of the wage classes is the sole cure for the evils they suffer	,,
Uneducated labourers do not value good cottages	,,
Educated labourers do appreciate good cottages	lxvii
Women are less employed than formerly in agriculture	,,
Agricultural work not degrading to females	,,
Improving education tends to remove superabundant population and increase wages	lxviii
Best educated labourers get to higher paid work than farm work	,,
Reason of the farmers' objection to education	lxviii
This reason ought to induce the State to enforce it	lxix
Effect of education in Scotland in raising the condition of the population in some of the Hebrides, and reducing the redundant population without any heart-burnings	lxx
Effect of education in the Scilly isles in raising the population from the extremest state of misery to high prosperity	,,
Necessity of teaching geography in schools	lxxi
Comparison between the minute of Committee of Council of 20th February 1867 and the French decree on the same subject on 10th April 1867	lxxiii
Object of the recommendations in this Report to carry out the proposals of the Newcastle Commissioners of Education of 1861	,,
Final answer to the questions proposed to this Commission	,,

COMMISSION ON THE EMPLOYMENT OF CHILDREN, YOUNG PERSONS, AND WOMEN IN AGRICULTURE (1867).

SECOND REPORT OF THE COMMISSIONERS.

TO THE QUEEN'S MOST EXCELLENT MAJESTY.

MAY IT PLEASE YOUR MAJESTY,

1. WE, the Commissioners appointed by Your Majesty to inquire into the Employment of Children, Young Persons, and Women in Agriculture, "for the purpose "of ascertaining to what extent, and with what modifications, the principles of the "Factory Acts can be adopted for the regulation of such employment, and espe- "cially with a view to the better education of such children," humbly submit to Your Majesty this Second Report of our Proceedings in execution of Your Majesty's Commission.

Reports of Assistant Commissioners.

2. The Assistant Commissioners have presented to us their Reports on the respective counties or portions of counties assigned to them, as follows:—The Honourable Edward Stanhope on the counties of Dorset, Kent, Chester, Salop, Stafford, and Rutland; the Honourable Edwin Portman on Hants, Devon, and Cornwall; Mr. F. H. Norman on the counties of Surrey, Wilts, Warwick, Worcester, and Hereford; Mr. G. Culley on Oxfordshire, Berkshire, Derbyshire, and Hertfordshire; Mr. R. F. Boyle on Somersethire. Not long after commencing his duties under us in June 1868, Mr. Boyle felt called upon to accede to an invitation to stand for the representation of the county of Cork. We accepted Mr. Boyle's resignation with the understanding that when the election was over he would complete his inquiry and his Report on the county of Somerset. The other counties which we had destined to Mr. Boyle were Cumberland and Westmoreland. To supply his place we proposed to the Secretary of State the name of a gentleman who had for many years resided in Westmoreland, and was well acquainted with both counties, Mr. Henry Tremenheere, of Craigside, Grasmere. The assent of the Secretary of State having been signified to us, Mr. Henry Tremenheere commenced his duties on the eighth of October 1868. We have, therefore, the satisfaction of adding his Report on those two counties and on a portion of Lancashire. We adverted in our last Report to our loss of the services of the Rev. James Fraser and Mr. J. J. Henley, the first from the demands upon him of his parochial duties, the second in consequence of his accepting an appointment as Poor Law Inspector.

Course of proceeding.

3. The course of proceeding adopted by all the Assistant Commissioners was to select, under the best local advice, certain districts in each county that might be considered typical, to make the inquiry as minute as possible in their districts, and to invite opinions and information by their circulars of inquiry, and other means, from the portions of the county exterior to those districts. By this system the whole of England, with the exceptions, comparatively unimportant to this inquiry, of Middlesex and the manufacturing portions of Lancashire, have been in these two years brought under review. We have much confidence in submitting to Your Majesty that a picture of the various conditions of agricultural life in England, so exact, so impartial, so valuable, both on account of fulness of detail and comprehensiveness of view, has never before been presented for the consideration of Parliament and the public as that afforded by the Reports of our Assistant Commissioners for these two years.

Questions ready for legislation.

4. The questions, therefore, respecting which we are enjoined by our Commission to inquire have now received illustration amply sufficient to point out the course for legislation in regard to England. We anticipate that during the autumn the inquiry will be completed in Wales, and that our Report will be ready for presentation at the beginning of the next Session of Parliament, and will thus enable both Reports to be then considered together. The inquiry in Scotland will follow immediately after that of Wales, and will, we expect, be completed early in the summer of next year.

Separate Reports necessary.

5. Not being able to concur in the conclusions suggested to us by the evidence, we are obliged to present to Your Majesty separate Reports.

All this we humbly certify to Your Majesty.

Given under our hands and seals this 22nd day of October 1869.

HUGH SEYMOUR TREMENHEERE.
EDWARD CARLETON TUFNELL.

2, Victoria Street, Westminster.

MR. TREMENHEERE'S SEPARATE REPORT.

TO THE QUEEN'S MOST EXCELLENT MAJESTY.

MAY IT PLEASE YOUR MAJESTY,

1. MY colleague, Mr. Tufnell, and myself not being able to take the same view of the results of the evidence which has come before us, I proceed to submit to your Majesty my separate Report.

Subjects of inquiry.

2. The principal points of the general question are stated as follows in our instructions to our Assistant Commissioners (Appendix to First Report, p. 161).

1. Is legislation required for the purpose of fixing the age below which boys should not be allowed to be employed in farm labour?
2. If it is, what is the age below which it would be desirable to enact that no boy should be employed in farm labour?
3. Is legislation required for the purpose of fixing the age below which girls should not be allowed to be employed in farm labour?
4. If it is, what is the age below which it is desirable to enact that no girl should be employed in farm labour?
5. Is there good ground for limiting the hours of work of boys?
6. If there is, what are the limitations proposed?
7. Is there good ground for limiting the hours of work of girls?
8. If there is, what are the limitations proposed?
9. Is there any need that the proper meal-times should be secured by legislation to the young and to females engaged in farm labour?
10. Is it necessary to secure by legislation that there should be limitations in proportion to age of the distance to which it should be lawful to take children, or young persons, or women to work?
11. Is it necessary to provide by legislation that females should be protected from unhealthy or unsuitable employment in agriculture?
12. In what manner can the principle of the Factory Acts be best applied to the education of the young in the agricultural districts, especial regard being had to the necessity of adjusting the periods of education to the different circumstances of different parts of the country?

3. In dealing with these points it will not be necessary to adhere to the order in which they are above stated; it will be more convenient to follow the order in which the facts present themselves in their bearing upon each other.

The most prominent fact, the exclusion from work proposed of all children under 10.

4. The most prominent fact, which cannot fail to strike any one seeking from the whole body of the evidence the solution of these questions, is the wide concurrence of opinion among farmers, owners of land, the clergy, and others in favour of arriving at a due measure of education of the young by excluding from work all children under 10 years of age. This opinion is embodied in the resolutions of a very large proportion of the meetings of Boards of Guardians and owners and occupiers of land called together by Mr. Fraser in the counties of Norfolk, Essex, Sussex, and Gloucester (A. 94). It is the "almost universal" opinion of the farmers in Mr. Stanhope's district—the counties of Lincoln, Nottingham, and Leicester—that there should be "a simple prohibition of "field work up to 9 or 10 (C. 173). Mr. Portman states, with a qualification hereafter to be adverted to, that in the county of Cambridge, and the three ridings of Yorkshire, "it is pretty generally conceded that 10 years of age would be a fair age to fix as a "limit below which boys should not be employed in the fields." Mr. Norman states that the majority of farmers in Northamptonshire think that children could be spared from field labour up to the age of 10 (E. 31). Most of the persons assembled at the meetings attended by Mr. Culley in Bedfordshire and Buckinghamshire, who favoured legislative restrictions at all, were for fixing 10 years as the age below which boys should not be employed (F. 51, 66). The same fact shows itself in all our Reports of the present year.

This is especially the farmers' view.

5. This is especially the farmers' view over a wide extent of country. But if closely looked at it will be found to exist almost universally where the farmer has no need of the labour of children under the age of 10, and where if debarred by legislative enactment from employing them, it would be no disadvantage, but rather a gain to employ older children at an increased wage. "At the worst it would only cost a farmer 6*d.* a "week more to get a boy over 10 to do the work now done by a boy under 10," and

this additional expenditure would purchase more efficient labour (E. 31). In the stiff clay districts, with some exceptions, it appears that boys under 10 years are but little wanted. "On this heavy land in Sussex a boy under 11 or 12 (driving the plough) would "not have strength to get through the day" (A. 26). The same is the case, with exceptions, in Nottinghamshire (C. 31) and in Yorkshire (D. 29), and for the same reasons. In North Northumberland the favourable conditions of agricultural life lead to the non-employment in field labour of children under 11 or 12; any legislative restriction, therefore, regarding the age of 10 would not affect that county. In Cumberland and Westmorland they are rarely employed before 12 or 13 (L. 105–6). In Berks and Oxfordshire Mr. Culley shows that very few children are employed under the age of 10 (J. 50, 63).

6. But general, although with important exceptions, as the opinion of employers of agricultural labour in wide districts in many midland and southern and other counties may be in favour of excluding children from field labour under the age of 10, the proposition assumes a different aspect when looked at from the labourers' point of view, even in the counties above mentioned, and much more so elsewhere. The labourers' point of view.

7. It is very true, as has been seen, that in some counties but few children under 10 years of age are employed at all. According to Mr. Culley's labour returns for Bedfordshire and Buckinghamshire, the proportion of boys employed under 10 years of age usually ranged from 4 and 3 to 1½ and 1 per 1,000 acres (F. 28, 29). In Oxfordshire and Berkshire Mr. Culley's labour returns show that very few children under 10 years are in regular employ during three-fourths of the year (J. 48). Mr. Fraser shows a very small number under that age so employed in the counties which he visited, even after the considerable correction which he states his table would admit of (A. 41, 42). In other counties the same fact exists.

8. But the small number of children under 10 employed in agriculture for longer or shorter periods in the year in certain counties affords but a limited ground from which to derive conclusions on this wide, and to the labouring man in particular, most important subject.

9. Even in the counties or portions of counties where there are the fewest children under 10 years either permanently or occasionally employed, the prevention of such employment by the act of the Legislature, may in many cases inflict privation on a labouring man and his family. But in many counties and portions of counties the labour of children under 10 years of age is largely employed, and is of much importance to the farmer. The earnings of these children are, in numerous instances, an important addition to the family income. In others the labour of such children is, in a large mass of instances, indispensable to the parents, quite irrespective of the question of earnings. Neither does it appear by the evidence that such labour as children under 10 years of age are put to is in general physically injurious to them; and wherever it is so, such injury may be arrested by a very moderate degree of interposition on the part of the Legislature.

10. The counties where the fewest children under 10 years of age are employed in farm work are for the most part those in which the total earnings of the agricultural labourers in permanent employ are high. In North Northumberland, where the earnings of farm labourers, nearly all being engaged by the year, amount in value to from 15*s.* to 18*s.* a week, the parents allow their children to remain at school until the age of 11 or 12, and then send them to work only in the summer up to the age of 14 (B. 7, 32). In Bedfordshire, Buckinghamshire, Oxfordshire, Berkshire, counties reported upon by Mr. Culley, the wages of permanent farm servants are 14*s.*, 15*s.*, 16*s.*, up to 17*s.* and 18*s.* a week (J. 101). In Yorkshire, where Mr. Portman reports that the children ought to be excluded from work until the age of 10, the value of a permanent farm servant's earnings is stated at 40*l.* per annum (D. 14, 15). In Norfolk, Essex, Suffolk, and Gloucester, the counties reported on by Mr. Fraser, the earnings of men in constant employ varied from 33*l.* to 37*l.*, 40*l.*, and 45*l.* per annum. Under such circumstances,—and happily this inquiry has brought out the fact that the earnings of the best class of agricultural labourers in permanent employ are now, generally speaking, such as to afford them the means of living and maintaining their families in decency and comfort,—where the total earnings of the year are of the satisfactory amount above indicated, and are rendered secure by a yearly hiring, the labourer of the southern and midland counties would suffer no pecuniary loss that he ought to regret if he were compelled by the act of the Legislature to do that which the Northumberland peasant does of his own accord, namely, to forego the earnings of those of his children who were under 10 years of age in order to let them go to school.

11. But even in those counties where the total earnings of permanently employed farm servants are as high as they are seen to be, there is below that class a large proportion of

farm labourers who are not hired for "wet or dry,"—said by Mr. Fraser to be in the counties visited by him about one-half (A. 76, note). By Mr. Culley, in Oxfordshire and Berkshire those who are not paid in sickness are said to be two-thirds of the whole even of those hired by the year (J. 29). There are others also who are incapable, either by want of aptitude or physical strength, of earning the higher rates of wages; others who are only wanted occasionally, or who are thrown out of work in winter, and whose total earnings consequently fall far short of the higher standards; these classes of men are thus described by Mr. Fraser (A. 76):—

"* * Though the more liberal farmers pay their regular men 'wet or dry,' yet this is by no means a universal practice, and the 'shifty' men who only work for the farmer when they can't get a job elsewhere, and leave him the moment they hear of anything more attractive, are naturally treated with much less ceremony." "* * At the Cromhall meeting it was stated that about half the men "on a farm, those, namely, employed about horses or stock, would be employed wet or dry. The others "would be paid if they chose to brave the weather, which few of them are inclined to do." (Notes of "meeting, No. 87, *see also* Miscellaneous Evidence, No. 24.) "* * So that there must be a very large "number of men in an agricultural district, men not disabled, but past their prime; men with less natural "aptitude and who can't put their hands to any sort of farm work; men who from sickness or weather "lose a considerable amount of time in the year; men whose roving unsettled habits indispose them to "regular employ, whose sum of yearly earnings must often be pounds below what farmers would state "to be the standard of the neighbourhood."

12. To these the earnings of their children from the earliest age at which they can earn anything are, in their eyes at least, of importance. Where the total earnings of the father of the family are low, it is doubtless, in the words of Mr. Portman, "of very "great importance to the mother that every sixpence that can be earned should be "obtained. During the last winter, when flour was at a high price, and where wages "had not risen in proportion," Mr. Portman found that "out of 12*s.* a week (the "husband's earnings) the outgoing for flour alone for the support of the said family of "six children was 10*s.* 6*d.* a week. The woman said she could not live without the "children's earnings" (D. 36). Again, it is possible that while the father's earnings may be low and precarious all his children may be under 10 years of age. "With the "value of every sixpence," Mr. Fraser says (A. 78), "so appreciably brought home to "their intelligence, and with odd jobs of all kinds which children can do, and by which "sixpences can be earned, so continually presenting themselves, it is a matter of regret "rather than of surprise that parents of this humble rank should not be superior to a "temptation the power of which no other class of parents can so fully feel."

If all children under 10 excluded from work aid in some shape would in some cases be required. Dispensing power proposed by some.

13. "That in such cases," Mr. Culley says (F. 102) legislation excluding from work all children under the age of 10, "would oblige parents of young families to apply for "aid in some shape cannot, I think, be denied" (j. pp. 362, 396). Mr. Fraser and Mr. Portman "would accompany such legislation with some dispensing power. If a high amount "of school attendance (for all under 10) were required, the magistrates, it was said, "might be empowered to relax the requirement in the case of any man who could show that "his family was above a given size or his earnings below a certain sum" (A. 98, D. 41).

Both undesirable.

14. I hope to be able to show that the desire of the country,—which aims at taking security that every child engaged in agricultural labour shall receive a satisfactory amount of elementary education,—can be fulfilled without having recourse to the principle of prohibition of the child's labour at any age; and without imposing on the parent the necessity for aid which would impair his feeling of independence, or on the magistrates the difficult, invidious, and undesirable task of granting dispensations from the requirements of an Act of Parliament.

The principle to be kept in view.

15. The principle which I desire to keep in view in the consideration of this complicated and difficult question is that Legislation should conform as nearly as possible to the existing habits of the country, and should interfere with those habits only to the extent indispensable to the objects to be attained.

Reasons.

16. I have referred to counties where children's labour under the age of 10 is very little required, and where the farmers are quite willing to be prevented by Legislation from using it at all up to that age.

17. I now beg to direct attention to those districts where the labour of children under the age of 10 is very much used; and where it is of the greatest importance both to the farmer and to the parent.

18. In four out of the six districts into which Lincolnshire may be said to be divided, —namely, in the Wolds, the Cliff, the Heath, and the Fens, where the farms are large and the population scanty, and the soil and cultivation of a peculiar kind, there is so large a demand for the labour of young children in bird scaring, tenting (looking after cows, sheep, pigs, or horses), weeding, picking twitch or stones, bean-dropping, singling turnips, and other descriptions of light work (C. 45, 59), that "the common age for boys to begin

"work in the field is 8, and many go at 7, some at 6 years old" (C. 70). In the two other districts of the county, the Isle of Axholme and the Marshes, there is a class of small freeholders and small farmers occupying "very rich land, especially suited for "garden cultivation, where the growth of potatoes is carried on to a great extent. The "land is cultivated by the small occupier with the help of his family," and he employs very little hired labour. This class is also very numerous in several parts of the Fens (C. 16, 17, 26). Being in many cases very little raised above the hired labourer, and more hardly worked and less well-fed and housed, "and often under a heavy incubus "of debt," and not being able to afford to hire labour, they are obliged to avail themselves of the labour of their children at the earliest age that they can be of service to them. At certain seasons (at potato-setting and potato harvest) almost all the female and juvenile population is engaged in field work. Their children are "worked earlier," and as a consequence have less schooling than those of hired labourers (C. 16, 17, 75). In the same manner in the south of Durham, where "the land is much subdivided, that "is, broken up into small farms," the labour upon the small holdings is done by the farmer and his family, perhaps assisted by one or more young people hired into the house and living with the family. "These small farmers," while always spoken of as an honest industrious race, "have a hard struggle to live," and take their children away from school to help them "at a very early age" (B. 66).

19. In Lincolnshire, the earnings of "confined" labourers, that is, men hired by the year and living on the farms, and "paid partly in kind," are good, amounting to 40*l.* or 45*l.* a year (C. 21). In their case, therefore, it is the great demand for children's labour by the farmers which causes it to be employed at an early age. In the cases of the small freeholders and occupiers of other portions of that county and of the county of Durham it is the poverty of the parents which obliges them to the employment of the children in field-work at the earliest possible age, and the demand is, under both these very different conditions, so great that, as appears from the evidence relating to those districts, a very large proportion of all the children available for field labour are brought into it as soon as they can be of any use. The same fact appears in Somersetshire (k. 215, 230.)

20. In Cambridgeshire, and in the north and west ridings of Yorkshire, this same class of small occupiers exists. "To these men," Mr. Portman says, "the loss of their chil-"dren's aid (under 10 years of age) would be fatal; they are too poor to hire labour, and "the assistance rendered by a child of 8 or 9 years of age is of great value" (D. 39). Mr. Portman perceives that the mere exemption of such children from a measure prohibiting the employment of child's labour up to the age of 10 would afford but little security for their obtaining any more education than the very small quantity they pick up at present (D. 39-42).

21. The higher rate of wages in Yorkshire, Mr. Portman thinks, is the reason why children do not go out to field work at so early an age as in Cambridgeshire. But, nevertheless, even in Yorkshire, they "do go out as young as 8 or 9 years." Children below 10 years of age are employed by the farmers at scaring birds and "tenting," which includes looking after pigs in the stubble and cows in the lanes (D. 25). In Yorkshire the hirings are for the most part by the year, and the earnings as increased by harvest and piece-work are "much in excess" of the average rate of 14*s.* a week. The necessities, therefore, of the farmer, probably more than those of the few labourers earning lower rates or having uncertain work (D. 10–13), cause the employment when it does occur of children under 10 years of age. But, in Cambridgeshire, where the practical working of the system of field labour with regard to education is, that now, as a rule, boys leave day school entirely at 9 years of age, never to return, "it is the com-"bined effect" both of the great demand, in public and private gangs, for children's labour on the light lands in weeding, gathering crops, twitching, singling turnips, and harvest work, occupying nearly nine months of the year (D. 18), and of the poverty of the parents (*ibid.*) that leads to their going out to field work "as young as 6 years old, "many at 7 or 8." "The reason for their going out so young appears to be in many "cases this, that the parents compel the ganger to take the little ones as a condition of "getting regularly the labour of the bigger child in the same family" (*ibid.*) Although, therefore, in some counties where the labour of children under 10 is little wanted, their exclusion from work under that age would only occasion their parents a loss not exceeding the rate of 1*s.* a week throughout the year, as in the cases adverted to by Mr. Culley (F. 102), and even less in the instances quoted by Mr. Norman (E. 31), it is clear that in the counties above named, where the demand for the labour of children under 10 years of age is great, and the desire of the parents that they should be employed, great also, the value of their labour to their parents in money or money's worth is equivalent to a considerable addition to the family income.

22. Precisely the same state of facts is found in Dorsetshire, Kent, Shropshire, Cheshire, Staffordshire, and other counties reported on.

23. In the portion of Dorsetshire where the farms are small "the occupiers in some "cases cultivate them with the help of their families with very little hired labour;" the population is "less well off," the wages are lower, and many men are thrown out of work in winter (G. 3). In another part of Dorset there is another class of labourers who have obtained small pieces of land on a lease for lives, with permission to build on it (G. 3). In the county generally one of its special characteristics is the system of "hiring whole families" (G. 7). The consequence of these various conditions is that boys go to work at a very early age, "some at 6 or even younger" (G. 6). "To "speak generally," Mr. Stanhope says, "the proportion of boy labour employed upon "farms is larger than in any county visited by me, even in the Fens" (*ibid.*). The causes are "the lowness of wages," which makes every labourer anxious to send his children out, although near Dorchester this is certainly surpassed by the eagerness of the farmer to get them (G. 7).

24. In Kent many men are thrown out of employ in winter; they are glad, therefore, to yield to the great demand in that county for children's labour, and to allow them to go to work for "occasional jobs" at the age of 7 or 8 for two, four, or even seven months in the year, as well as to employ them themselves from the age of infancy (G. 25–6).

25. In the south-western corner of Shropshire, bordering on Wales, there is a district of small farms. Employment is less regular and wages are low. "The condition of the "peasantry, in no part of this county very satisfactory, is in this hill country of "the south most deplorably low." The poverty of the parent consequently, for "in "this district little pressure is put upon the children by the farmers to go to "work," causes the children "to become irregular at school about the usual age of 8 "or 9" (G. 64).

26. In all these, as in other counties which it would be superfluous to refer to by name but where the same facts may be verified (h. ss. 1, 2, 3, 19, 23, 42, 49, 79, 83, 120, 135, 229, 304, 310, 336, j. pp. 374–5, p. 394, s. 26b., k. 181, 229, 230, 256, s. 6), it is, in the words of Mr. Stanhope (G. 103), "mainly the struggle for existence among the poor," which makes them wish to withdraw them from school and profit by their earnings at the earliest possible age; and the fact that in some counties, as in Oxfordshire and Berkshire (J. 63), (although with exceptions even there,) Cumberland and Westmorland (L. 92, 94), and others already referred to, "agricultural labour is but little wanted before "the age of 10, and does not seriously interfere with the school attendance of children "under 10 years of age" (J. 63), would afford no sufficient justification for an enactment excluding from farm labour children under 10 years with a view to their school attendance up to that age while such pressing demands and necessities both of the farmer and the parent exist on so wide a scale in other parts of the kingdom.

27. If facts too strong to be disregarded, namely, the vital importance to the labourer of the earnings of his child in numerous cases, and the imperious demand for children's labour for farming purposes at an earlier age than 10 years in many of the most important agricultural counties, afford strong reasons against an enactment excluding children from farm labour up to the age of 10, the next point for consideration is, would such non-interference with their labour up to that age leave them exposed to physical injury, arising from work at too early an age, and further would it present any serious obstacles to their acquiring such an amount of sound elementary education as is now generally recognised to be indispensable both for their own interests and those of the country at large?

28. Speaking generally, and subject only to very limited exceptions hereafter to be adverted to, the early age at which children go to work, and their hours of work, are not found to be physically injurious to them.

29. In North Northumberland the hours for women and children are so regulated as to be deserving of consideration in other parts of the kingdom. Mr. Henley thus describes them:—

"The hours of labour for women and children are nine and a half hours in summer, viz., from six to six, with two hours and a half for meals; that is, two hours for dinner and a short break at nine and at four. In winter the hours are regulated by the light. These hours of work are earlier and longer than in the south. On the other hand, the women and children are able to return home for a long rest in the hottest time of a summer's day when they find their dinner cooked for them, and as the majority are single women the early start from home cannot be prejudicial.

"I am persuaded that any restriction or interference in the present system of employment of women and children would be detrimental to the social condition of the district and destructive to the turnip husbandry of Glendale ward.

"At certain seasons it is absolutely essential that all the labour on the farm should be united, men, horses, women, and children working together. And though the work at such seasons is severe the pressure only lasts for a limited time."

30. And as the children seldom go to work before 11 or 12 years of age, and then only for summer work (B. 32, 46), the habits of that county afford a standard of comparison with the ages of going to work and the hours of work elsewhere.

31. Of the age and hours of work for boys in the counties of Lincoln, Nottingham, and Chester Mr. Stanhope says that,—

"Where the hours are not too long or the work too hard, few persons think such employment as is given to young boys hurtful to them. The medical testimony is almost unanimous on this point. Several witnesses, on the contrary, speak to the great advantage a boy gains from the better food which his earnings enable his family to give him, but the best evidence on this point is the appearance of the boys themselves. No diseases or deformities appear traceable to this early work; no such cases were pointed out, and few were mentioned to me. The boys throughout my district appeared to be healthy and well formed. Where boys in a school were indicated to me as having just come back from field work they were almost always strong and healthy looking" (C. 71).

32. Again,—

"Boys working alone are generally employed from 6 a.m. to 6 p.m. in summer, and from light to dark in winter. At tenting these hours are exceeded, but this is 'passive work,' and the time is only complained of on account of the long exposure to bad weather and vacancy of thought.

"These hours do not appear excessive for boys 12 hours (inclusive of meal times) may seem a long time for boys of 8 or 9, but in practice it is found that the work done by such children is so light that it can do them no injury, and employers are very reasonable in adjusting the description of work to the strength of the lad" (C. 88–9).

33. Again,—

"These children do not grow up to be unhealthy or deformed or unfit for work, but, on the contrary, they become labourers who can compare in strength and ability with any in England."

34. In Cambridgeshire and the three ridings of Yorkshire, Mr. Portman did not find that the health of children had suffered from overwork in bad weather or in wet crops (D. 19), and, with one of the exceptions hereafter to be noticed, he thinks generally that the light work of children under 10 does not injuriously affect them (D. 40). The same opinion is expressed by Mr. Norman in relation to Northamptonshire, where boys "begin "to work about the age of 8, a few as young as 7" (E. 10, 11, 18). Mr. Norman states distinctly (E. 23) that he thinks it clearly proved by the medical evidence that no restriction upon children's labour is required on the ground of health. Mr. Culley in his Report on Bedfordshire and Buckinghamshire, although referring to the same exceptional cases as have been adverted to by others, concurs in the very strong opinion expressed by almost every witness he examined that "as far as protecting the children from personal injury "arising from the nature of their employment in agriculture is concerned no legislative "interference is necessary" (F. 32). In his Report on Oxfordshire and Berkshire Mr. Culley, while referring to the same exception, expresses the same general conclusion that legislative interference, for the sake of protecting children from physical injury supposed to arise from the manner in which they are employed in farm labour, is not necessary (J. 52). Mr. Stanhope in his Report on the counties of Dorset, Kent, Chester, Salop, Stafford, and Rutland, while strongly commenting on one of the exceptions about to be noticed, states that "on physical grounds alone there appears no reason for interfering "with the ordinary light labour to which boys are now put at occasional seasons," but rather sound grounds for encouraging it (G. 97). In other counties where the labour of children under 10 years of age is employed the same opinions prevail.

The exceptions above alluded to are the following:—

35. The first relates to the employment in some counties of boys at a very early age with horses, following either the cart or the plough, the horse-hoe or the drill. This is very much the case in Dorsetshire, where boys begin to go with horses at the age of 7 or 8, and are often so employed very long hours, *i.e.*, from 5 a.m. to 7 p.m. In Leicestershire they begin at 10 (C. 172). Mr. Stanhope thus describes the practice in Dorset:— Exception, boys going with horses.

"But employment with horses when regular throughout the year appears to me to be the reverse of 'light.' The hours are very long (often from 5 a.m. to 7 p.m.); it gives little leisure to a boy, and requires him to walk every day at least 10 or 12 miles over ploughed ground. In most counties no farmer would think of putting a boy to such work, unless very exceptionally strong, before 10 or 11 years of age; yet in Dorsetshire many boys, as before mentioned, begin at 7 or 8. One very large employer of such boys near Wimborne, who begged that his name might not be made public, considered all fit to go with horses at 6, and to plough at 8 or 9 years of age. In that county, indeed, the per-centage of boy labour is excessive, and it seems probable that to this cause, next to insufficiency of food, is partly traceable the stunted condition and early decrepitude of the adult population." (G. 94.)

36. And it is thus further described in detail:—

"But the objections to early employment with horses are very strong. Dr. Aldridge, of Dorchester, attributes to it 'the prevention of proper muscular development, and very often the production of 'tuberculous diseases.' 'The sameness and overhardness of toil mars the young and yielding 'muscles.' 'It is seen in their after life in a way to me most clear; there is a want of physical 'energy,—of what I may call labour pluck,—a deadening of mind and body force.' 'A boy of this sort '(7 or 8 years' old) gets up with his father at 4 or 5; has to help to prepare and feed the horses; walks 'from 6 till 2, except a little halt for meals; then comes to dinner, and returns to feed the horses. I 'see the effect of this early work in making the boys bow-legged.'" (G. 96.)

37. Mr. Stanhope adds in the following paragraph that he believes that "the opinion "even of farmers in most counties would agree in condemning continuous work with "horses at an early age, and in fixing 11 or 12 as the very earliest time at which it "ought reasonably to be undertaken." (G. 97).

38. In North Northumberland the practice is that "horses are never entrusted to "boys before the age of 14" (B. 33).

39. Mr. Stanhope says above that in most counties no farmer would think of putting a boy to such work, unless very exceptionally strong, under 10 or 11 years of age. In the counties reported on by Mr. Fraser, "few farmers are said to be likely to put "boys to drive the plough, the horse-hoe, or the drill until they were 11 or 12 years "of age" (A. 45), but Mr. Fraser had reason to assert that at plough-driving a boy's day's work was not unfrequently 14, 15, and even 16 hours long, of which he had "abundant proof."

40. The farm labourers with whom Mr. Fraser had a conference at Newent told him that "a carter boy would be expected to get to his work between 5 and 6 a.m., and "perhaps does not leave off till between 7 and 8 p.m." And they added that "these "hours are too much for little boys, but they can't be shortened: and the change "that is wanted is to employ bigger boys, who can better stand the time. A lad "of 14 to 16 in their opinion would make a better carter boy than one of 12 or 13" (A. 46).

41. In Kent, the same fact presents itself, although in a minor degree. The waggoners occasionally take their own sons to help them as their "'mate' before the age of 10 "years." As soon as the boy becomes a "mate" "almost all opportunity of self-improve- "ment is gone. A boy works from 6 a.m. till 8 or 9 p.m., and is entirely under the "control of the waggoner, almost invariably an utterly ignorant man. Very few "farmers will interfere to make it possible for the mate to go to a night school, if he "would, but no great disposition seems to be shown to do so. Often the hours for "feeding horses are so arranged that it is quite impossible for the lads to get away to "either school or church." (G. 27.)

42. And although there appears to be an increasing disinclination in the boys to become "mates," the hours "being too long for them," yet as "almost all the boys of the "agricultural labouring class leave school altogether at 10 years of age on the average, "and in the case of schools under a mistress about a year sooner," there will always be a probability of some boys being subject by their fathers to these long hours of work at an age before 11 years. (G. 28, 29.)

43. The same point was brought to the notice of Mr. Culley by several medical gentlemen in Bedfordshire and Buckinghamshire. Mr. Culley adverted to the effect produced, or supposed to be produced, on the feet and limbs of plough boys (and field keepers) by travelling over the tenacious soil which covers a considerable area in the north of both counties, and the practice of leaving boys when too young in charge of horses and carts (F. 32). Also in Oxfordshire and Berkshire Mr. Culley found that "carter's boys, *i.e.*, "those who help the carters who have charge of horses, are expected to be in the "stables soon after 4 a.m., when they bait their horses; at 6 they are allowed an hour "for breakfast; from 7 a.m. till 3 p.m. they drive the team in the field, having a rest "of from 15 to 30 minutes for luncheon at 12 o'clock. After putting in the horses "at 3, they are allowed till 4 o'clock for dinner, and are in the stables again baiting "and doing up their horses till about 6 p.m. They, therefore, have 11 or 12 hours' "work, less the 15 or 30 minutes for luncheon, according as they are in the stables "at 4 or 5 a.m."

44. Mr. Culley proceeds to remark that "the long hours of carter boys are by several "witnesses considered to be injurious to their health." "The evil effect on the feet "and limbs of boys, arising from the tenacious character of the soil, over which many of "them have to drive their team for eight hours in succession, was pointed out by "several witnesses;" and on this head Dr. Batt, of Witney, says (see Oxon evidence 72),

"I think that children are employed too young in heavy ploughed land; it tells on them "in after life; when they get to be about 50 they go at the knees and are very much bent."

45. Mr. Culley while thinking that "the long hours of the carter boy are unsuited to "the age of many of those who are employed in that capacity," and while attributing "the peculiar gait of the male agricultural labourer in these and the adjoining counties "to the effect of the sticky land (perhaps aided by tight leggings) on the feet and legs "of the team boys," thinks, nevertheless, from the facts gathered in the counties he visited, that legislative interference with this practice is not required. The question, however, as has been seen, involves still graver facts in the county of Dorset, and has been shown to be of importance in other counties.

Age below which boys should not be employed with horses.

46. All these facts point to the propriety of fixing an age below which children should not be employed with horses. By the Act 3 Geo. 4. c. 126. s. 131, no boy under 13 may drive a cart on a turnpike road. That Act is said to have failed in some places as being adverse to public opinion (C.111; G. 95). I presume to think that an enactment prohibiting boys under the age of 11 from going with horses, and therefore freeing them from liability to be at work from 4 or 5 a.m. to 7 or 8 p.m., would have a strong public opinion in its favour.

Private gangs do not require legislative regulation.

47. The question of whether any restrictions are required on physical grounds on some other branches of juvenile agricultural labour has been adverted to in several of the Reports of the Assistant Commissioners. The matters most prominently mentioned are those of the employment of children in private gangs, and the distances to which in some counties children are obliged to go to their work, whether to be employed in a private gang or individually.

48. I agree with an observation referred to by Mr. Stanhope (G. 92), that in respect to these matters it "will require a strong case to justify interference." On reviewing the whole of the evidence on these points I do not think that there is such a case. The difference between a private and a public gang is thus very clearly stated by Mr. Norman (E. 6) with respect to a private gang:—

"The remuneration of superintending labourer does not depend upon the amount of work performed by the gang, therefore it is not his interest to overwork them; and the profit of the farmer does not depend upon his employing very young children, therefore he has no inducement to engage them before they are strong enough to perform the labour allotted to them."

49. To the same effect are the remarks of Mr. Portman:—

"The private gang is constantly employed by one and the same farmer, and is always at hand for the work. Half an hour's cessation from any particular job on account of bad weather would not be of much consequence to the employer, because he can with certainty put on the same number of hands on the following day, whereas in the case of a public gang they are taken from farm to farm and are compelled by the ganger to complete the work at each place on a specified day in order that he may proceed to fulfil his contract on another farm" (D. 19).

50. Mr. Fraser, although disposed towards extending to private gangs some of the limitations existing in regard to private gangs (A. 38, 39), adverts to the fact that "it "would only be on farms of the largest size, ranging from one to two or three thousand "acres, that anything like continuous employment could be found for a private gang; and, "unless it were likely to be continuously employed, few farmers would take the trouble "to organize one." In this a witness, quoted by Mr. Portman agrees; he thinks that "the farmers will find it very expensive to send out a man in charge of five or six "children, and that a small farmer would have a difficulty in getting the work done one "or two days in the week" except by a public gang (D. 21). On such exceptionally large farms as above adverted to, or even on farms of much smaller size, but still large enough to make that species of organized labour profitable, it may be inferred from the evidence before us that the intelligence of the employer would lead to a system of work most conducive to permanent efficiency. Such are the examples given by Mr. Culley in his Report on Bedfordshire and Buckinghamshire.

"It will be seen from the evidence that employment in private gangs exists only to a very limited extent in either Bedfordshire or Bucks, and is usually confined to the employment of from 10 to 20 boys between 8 and 13 years of age under a steady labourer or foreman. In only one instance was a return made to me of such a gang where both girls and boys are employed, and in that case it consisted of five boys and five girls all under 13 years of age, occasionally employed in twitching, weeding, &c. (see Mr. Stephenson's evidence in Summary of Circular Questions).

"I had several opportunities of seeing these boys during my stay at Woburn, and I think that if children are to be continuously employed in farm labour between 10 and 13 years of age they could not be employed in a manner better calculated to make them efficient labourers without overtaxing their strength than that in which the boys composing the Woburn gang are employed. The Melchbourne Park gang consists of 10 boys between 8 and 10 years of age employed in light work during spring, summer, and autumn. The Aston Clinton gang is composed of 15 boys whose average age is 10½, and of these the Rev. C. W. W. Eyton says, 'there is nothing injurious to the health of these boys arising 'from the nature of their employment, nor are they ill-treated in any way.'

"The same remark would, I think, apply to all the boy gangs in these two counties, and putting aside the educational part of the subject, it appears to me that children are better employed in such gangs or parties than when mixed up with adult labourers or draggling after their parents in piece-work" (F. 26).

Question of restrictions on female labour.

51. There is no question within the scope of our inquiries upon which greater differences of opinion have been recorded in our evidence than that of the necessity or otherwise of legislative restrictions on the employment of women and of female children.

Great varieties of opinion.

52. The varieties of opinion on the subject which appear in the Reports of all our Assistant Commissioners are thus fully represented by Mr. Fraser (A. 51),—

"Some would prohibit female labour altogether; some would limit the restriction to unmarried women under 20; others would prohibit up to the age of 18, or 16, or 13; some would allow work up to 13 and prohibit it afterwards. Some would limit female labour to special kinds of work, or to special seasons; would allow it in haymaking, harvest, and hop-picking, and in the more temperate months of the year, but would prohibit it in other farm operations and during the winter. Some think the evil is confined to cases where females work together in gangs, and that there is very little harm in their employment in small groups, still less when they work in their mother's company or under their mother's eye. Not a few consider that the evil is lessening, and in some parishes has even disappeared, and see no necessity for legislative restrictions at all."

53. These diversities of opinion doubtless truly represent the impressions of individuals well competent to judge upon the state of circumstances coming under their observation in their respective neighbourhoods.

54. The physical injury attending the employment of females in farm labour is nowhere represented as weighing so much in determining the question as the presumed moral injury. In a few cases indeed, such as that in particular of women attending to threshing machines (A. 49, C. 44, G. 80), legislative restrictions have been suggested. But the practice is also said to be on the decline (C. 44); and in Northumberland, neither that nor any other description of farm work is found to be attended with injury or disadvantage to the women (B. 22–31). In all the other districts reported on no restrictions were thought necessary upon the labour of women or girls either on physical or moral grounds (D. 33, 34, F. 33, G. 82, 86–89, H. 48, I. 24, J. 55, K, 16, L. 22).

Legislation not necessary.

55. The opinion is very general that there is an increasing "disinclination to field "work on the part of women" (I. 24); that "the employment of women in the fields is "gradually dying out" (H. 48); that "the practice will in time disappear under the "influence of public opinion and the gradual improvement in manners" (L. 22); that "no gain to morality" can be expected from legislative interference by attempting "the "separation of the sexes while at work" (C. 64–66). In other districts "few "young girls are employed" (J. 53), or few females generally (E. 8), or the employment of young girls in the field is almost universally condemned (D. 34).

56. "The evil," Mr. Fraser says, "is to some extent being mitigated by natural and "spontaneous influences. Everywhere I heard the same story that women are found "to be less and less disposed to go out to work upon the land. They will refuse "unsuitable work; they will stay at home on wet days. Whether from the easier "circumstances in which they live, or from their having become intelligent enough to "take a more accurate measure of loss and gain, there seems to be much less attraction "for them in the farmers 8*d*. or 6*d*. a day than there used to be" (A. 49).

57. I therefore think the following conclusions of Mr. Fraser applicable to the general question:—

"One may venture to trust somewhat to the curative influences of education and social progress. Agriculture, I pr sume, has not declined in the last quarter of a century in the counties of Gloucester, Essex, and Sussex, yet not a fifth part of the number of women is employed upon the farms in these counties now that was employed upon them 25 years ago. Many forms of labour—driving carts, for instance—which they undertook without reluctance then, nothing probably would persuade them to undertake now. The more extensive introduction of machinery is likely to supersede much female, and indeed much juvenile, labour; and though to our impatient eyes the march of social improvements always seems slower than we think it ought to be, and in fact we can only estimate its rate when we carry our memory back over a considerable flight of time, yet it may be retarded rather than quickened by legislation, if public sentiment rebels against that legislation as needlessly vexatious, interfering, uncalled for, or inopportune." (A. 53.)

Distance to which a child should be allowed to go to work.

58. On the subject of regulating the distance to which a child should be allowed to go to its work, Mr. Stanhope refers to the fact that "the only time when it is a real hardship "to children" to go long distances to work "is when their hours of work are not "diminished in consequence of the distance they have to go" (C. 103). In the counties reported upon by Mr. Portman, it appears that "the women and children "travel to and from their work in their employers' time and not in their own" (D. 30).

59. Mr. Portman adds that "inasmuch as the interests of the employer would lead him to seek his labour in the nearest place, and the interests of the head of the labourer's family would prevent the children being sent a long distance to work at the same rate of wages as if the work were close to the door, legislation on this point is not necessary" (D. 30). Legislation not required.

60. In the districts included in Mr. Stanhope's Second Report (G. 100) he found that "women and children are rarely taken long distances to work, the Irish gangs out of the large towns of Cheshire and Shropshire constituting almost the only exception. In other cases the work is at no such unreasonable distance as to call for any special notice." Also, Mr. Henley states (B. 214) that in his district "it is not necessary to limit by legislation the distance to which children should be taken to work, as no abuse exists."

61. A point on which it was thought from the evidence collected during the Inquiry of 1866 into the public gangs, that legislation might be required, namely, the employment of females in weeding high corn in wet weather, appears to be confined to the Fen district of Lincolnshire, where it was first observed" (C. 113) (D. 19). Another point is also cleared up by the evidence, namely, that no legislative interference is required in regard to meal times. Employment of females in weeding high wet corn. Legislation not required for; or as to meal times.

62. Having disposed of the instances in which children's labour at a very early age is, or has been supposed to be, physically injurious to them, I will now advert to one species of employment in which moral injury may reasonably be inferred to result from the manner in which it is now carried on.

63. The species of employment alluded to is that of "tenting," which includes the scaring of birds, and looking after cows, sheep, pigs, or horses. "The scaring of birds," Mr. Stanhope says (C. 45), "would for the most part employ children for a few weeks in spring or autumn, but other descriptions of 'tenting' often employ a boy almost all the summer. On the sand of Notts I found many children employed in this way in the winter also. This employment involves a long day's work from sunrise to sunset. It is a passive work, for a boy tenting crows has little else to do but 'to 'shout.' So little is there to occupy the mind in it that the chief complaint against it is that it encourages vacancy of mind and listless habits, and it is of no use in training up a child to work." Sunday work of children.

64. But the evil arising out of these occupations is that they are continued during the whole of Sunday. "Boys go to it at 7 or 8 years old. Some go even at 6. Girls do a great deal in some districts, and at the same age as the boys" (C. 45, 46).

65. Mr. Fraser thus speaks of the injurious moral effects of the practice in the counties which he reported upon:—

"The effect of employing the same boy every day in the week, perhaps for months together, upon his general character and tone of mind is one that only those who have had experience of it can adequately appreciate; it is emphatically brutalizing. The boy never cleans himself, never puts on his best clothes, loses all reverence for the Sabbath, severs a link that attached him to his teachers and school-fellows, and misses the chance that the Sunday school would have given him of having a little intellectual movement imparted at least once a week to the stagnant faculties of his mind." (A. 48.)

66. Mr. Fraser calls our attention to a suggestion made to him by the Rev. J. D. Ballance, vicar of Howford, Norfolk, namely, "that where boys are employed, as they frequently are when bird scaring or sheep tending, all the seven days in the week, the same boy should not be employed on two successive Sundays, but only on alternate Sundays" (*ibid.*).

67. In Northamptonshire, Mr. Norman found that "the boys employed in scaring birds usually have to come on Sundays. They were occasionally relieved for a part of the day by another member of the family so as to have an opportunity of going to church" (E. 17). This amount of consideration for the children so employed does not appear to be common, and is not to be depended upon. In Somersetshire, Mr. Boyle notices that "Sunday is no exception" to the days in which children are employed at bird scaring, so that they get no holiday at all during the week. From the nature of the case this may be inferred to be the most common practice throughout the kingdom, and one with regard to which it may well behove the Legislature to interpose in order to secure for the young children so employed the benefit of every alternate Sunday for attendance at church and Sunday school. Should only be allowed to be employed on alternate Sundays.

68. I have shown that there is no ground, from a physical point of view, for adopting the suggestion made by so many employers of labour that all children under 10 years of age should be excluded from farm work, and I have adverted to the two species of work—the going with horses and "tenting" on Sundays, in respect which a very

moderate amount of legislative interference is required. The next question for consideration is, Is it necessary to fix any minimum age, as under the Factory Acts, below which it shall not be lawful to employ children in agriculture? I am of opinion that it is not.

No minimum age required under which children should not be employed.

69. The conditions under which a child is employed in a factory or a workshop are so different from those under which a child is employed in any occupation connected with agriculture, that reasons for the limitation of children's labour which were of irresistible weight in one case have a very restricted application in the other. In a factory or a workshop a child is liable to work in a close and heated atmosphere; and when working in connexion with machinery its attention is ever on the stretch and its movements are often rapid and continuous for various periods of time together. The effect of such a mode of employment upon the very young was shown to be physically injurious to them, and therefore to justify legislative measures for their protection. But it has been seen that employment in the healthy occupations of agriculture cannot be shown to be attended with physical injury, even to the very young, with the exception which has been pointed out above, and for which the interposition of the Legislature has been suggested. There are, doubtless, cases in which children may have suffered from being so long on their legs at bird-scaring and tenting while the days are long (A. 46), but Mr. Stanhope remarks that although in "tenting" the hours are long, it is nevertheless "passive work" (C. 88), and Mr. Boyle's remarks (K. 6), that fatigue arising from it is exceptional, corresponds with the general opinion as already referred to in detail. Also, although being exposed to wet and cold in spring is noticed, in the case of children so employed, as an occasional subject of complaint, it is not a matter of such gravity as to require that the protection of the Legislature should be invoked on behalf of such cases. The good feeling of employers "in adjusting the description of work to the strength of the lad" (C. 89), and in affording the means of shelter (Boyle, K. 6), and due care on the part of their parents to shield their children so employed against wind and weather by proper clothing, may be looked to as their sufficient protection.

The analogy of the Factory Acts not applicable.

70. Another marked difference also between employment in a factory or workshop and employment in agriculture consists in the fact that when once a child begins to be of use in earning wages in manufacturing employment, it is liable to be so employed continuously. From the effects therefore of such continuous occupation at too early an age the factory legislation very properly interposes to shield the child entirely until the age of 8 years, and then only permits it for the half of every day, or for every alternate day. But the necessities of agricultural employment do not demand the continuous employment of children below the age of 8, or even, except in the particular cases which have been noticed above as justifying legislation on their behalf, below the age of 10 or 11 years; and the periods of demand for the labour of very young children are separated from each other by others when there is no demand for it, and which consequently are to them periods of entire rest.

Much reason for leaving children free to accept work when wanted.

71. There being no reason, on the ground of physical injury, for fixing an age below which children shall not be allowed to work, there is, on the other hand, much reason for leaving them free to accept work when wanted for it. They have been shown to be indispensable both to large farmers and small occupiers at certain times of the year in a large portion of the kingdom; and their earnings are in so many cases of such importance to their parents that it would demand a very strong case of physical or moral injury to justify Parliament in depriving the family of that source of income. It is said, indeed, that in some instances, taking the extra amount of food required by the children when at work, and the extra wear and tear of clothes, the sum earned does not equal the expenditure. But the remark of a lady whose experience among the labouring classes is said by Mr. Stanhope to be very great (C. 81) may be taken, on this point, as of very general application. "It is" (under certain circumstances) "bad unprofitable work, but hunger is worse." (*g.* 45, 150, 200, 201; *i.* D. ss. 11, 15, 17, 22, 24, 26, 27, 31, 36; *j.* p. 395, s. 28 b.; p. 405, s. 68; k. 141, 151.) On the whole, however, the evidence demonstrates that it is far from unprofitable. Even the minimum wages of 3*d.* a day, for the occasional periods of work, for the very youngest, go some way towards the family sustenance "in hard times;" and there can be no doubt that the more usual rates in many districts of 4*d.* or 6*d.* per day for children under 10 years of age are a substantial addition to the resources of the family (*infra* § 113).

Exclusion from work would not necessarily imply attendance at school.

72. It is with a view to a more regular and more prolonged school attendance that a restriction at which children may go to work in agriculture is most strenuously urged. It is argued that they should be excluded up to a certain age from going to work, in order that they may go to school; and it being plain that their not going to work does not necessarily involve their going to school, it is further required that Parliament should

devise some form of compulsion to oblige them to do so. The form of compulsion very much advocated is that no child should be allowed to go to work in any agricultural employment unless it can produce a certificate of having obtained a certain amount of education or having fulfilled certain conditions of school attendance (A. 60, 62, 94, 99; E. 29; *j.* p. 375). Form of compulsion suggested by some inadmissible.

73. But it is essential to observe regarding this proposal that it is one that has only been accepted in the legislation of its country in one case, that of the children working in mines and collieries; and that this case is not one the circumstances of which afford a justification for its adoption, as an example, in the case before us. The Act 23 & 24 Vict. c. 151., s. 1, excludes any boy under 12 years of age from working in mines or collieries, but permits him (by s. 2) to work at 10 on production of a certificate, "under the hand "of a competent schoolmaster, that such boy is able to read and write." The wages of a miner or collier are so high as to permit of a provision excluding his son from labour in a mine until he can read and write, without hardship. The Act is, nevertheless, rendered nugatory by the employers almost universally declining to take boys to work under the age of 12, and its provisions are in course of being reconsidered by the Legislature. The certificate is considered of no value, as it fixes no definite standard of acquirement. The circumstances of the agricultural labourer are so different from those of the miner and collier that it appears to me impossible that Parliament should be willing to adopt the principle of this Act by excluding his children from work under a certain age.

74. Such a proposal, if sanctioned by Legislation, would throw upon the parent the whole burden both of the maintenance and education of the child without any contribution on the part of the child towards either.

75. It has been shown most distinctly in previous paragraphs that there must be numerous instances throughout the country in which such a burden could not be borne by an agricultural labourer without external aid. It has been seen that even in those counties where the wages of agricultural labourers in constant employment range high—to say nothing of those where the rates of wages are low—there is the whole class of men not in constant employ; a certain other proportion of men unequal, either from want of aptitude or physical capacity, to earn anything beyond the lower rates of wages; a certain other portion thrown occasionally out of work by ill-health or accident. To all these the obligation not only of keeping their younger children from work but of clothing them sufficiently to enable them to attend school, and of paying the school fees, would be felt to be more or less oppressive under these varying circumstances. It is, Mr. Stanhope rightly says, mainly the struggle for existence "among the poor which makes "them wish to be free from any restrictions likely in any possible case to interfere with "their earnings" (G. 103). The mere payment of the school fee from some public source would be an equivalent for only a small fraction of those earnings, but as far as it went would but strengthen that feeling of dependence which the mal-administration of the old Poor Law has infixed so deeply in the mind of the rural population, and which it is of the utmost importance by every possible effort to eradicate (F. 102). On the other hand, if the principle of a dispensing power were admitted in cases where the earnings were below a certain standard, or the family numerous, or the labour of a child even without earnings indispensable to a small occupier as an assistance to himself, the instances of exception must inevitably in many localities be so numerous as to leave large numbers of children free from any obligation as to school attendance, and everywhere the pressure upon those who may have the dispensing power in their hands would be liable to be so great that its exercise under the various and complicated circumstances that may be urged upon them for consideration could not fail to be invidious and unsatisfactory; and if exercised it would exempt from the obligation of school attendance precisely those who most need some amount of pressure to bring them to school.

76. The only principle approaching the nature of compulsion in regard to the education of the young of the labouring class above the grade of paupers that has, up to this time, been admitted into the legislation of the country, with the exception above noticed, and which has been shown not to be applicable as a guide to the case before us, is that of connecting the obligation of school attendance with wages-earning employment. The only sound principle is that already sanctioned of coupling the obligation of school attendance with wages-earning employment.

77. This principle rests on a just view of the extent to which parental obligation may be enforced, and permits the Legislature to say that if a parent benefits by the labour of his child he shall be compelled to apply a portion of the child's earnings in the fulfilment of his duty to his child, and for his child's advantage, namely, in procuring for it a certain amount of education.

78. Public opinion in this country justly sanctions the enforcement of such an obligation upon the parent by fine or imprisonment. The Workshop Regulation Act (30 & 31

Vict. c. 146.) which embraces all kinds of handicrafts not included in the Factory Acts, in defining "employment" to mean occupation in any handicraft, whether for wages or not, under a master or *under a parent*, thus describes the liability of the parent in case of a child being employed in contravention of the Act. (s. 7.)

"The parent of or the person deriving any direct benefit from the labour of or having the control over the child * * shall be liable to a penalty of not more than 20*s*., unless it appears to the court before whom the complaint is heard that the offence has been committed without the consent, connivance, or wilful default of the parent or person so benefited, or having such control."

79. And by s. 12, this penalty is recoverable summarily in the manner directed by the Act 11 & 12 Vict. c. 43., which gives the power of imprisonment if the penalty is not paid.

The contrary principle adopted in Prussia would not be tolerated in this country.

80. But public opinion would, I fully believe, be far from sanctioning the imposition of a fine or imprisonment upon a labourer in agriculture for not sending his child to school, and not keeping it there for the prescribed periods of attendance, before such child went to work. That is the principle adopted in the legislation of Prussia. It is thus described by Mr. Pattison in his Report to the Education Commission (1861) vol. 1, p. 194.

"The police commissary of the district (*Bezirk*) sends in to the Commission the list of the *Schulpflichtig* children.* The members of the Commission are expected individually to visit the parents to urge upon them the moral obligation of seeing that their children attend regularly; only when this private influence is ineffectual an official admonition is given to the parent or guardian. If within a month from this monition a second 'inexcused' absence occurs a written notice issues from the Commission reminding the defaulting party that he makes himself liable to a penalty; this notice is registered. If a third 'inexcused' absence occurs within a month the Commission sends notice to the school delegacy, adding from the record a copy of the previous notice; this notice is handed to another committee of the school delegacy which is charged with the enforcement of the fines. This committee inquires into the case, assesses the fine, and orders payment within eight days. It is open to the condemned party to appeal during these eight days to the *Magistrat*. The sentence of the *Magistrat* is final. The fine may be levied by execution. If there are no effects the offender is punished by imprisonment." [* "Schulpflichtig," "under the legal obligation to attend school."]

Prussian principle fails where poverty of parents interposes an obstacle.

81. But even with such an organization as above described for carrying the law into effect Mr. Pattison reports that difficulties interpose to prevent the attendance being uniform and punctual, and the first of these difficulties he states to be "the poverty of the parents," the second being the unsatisfactory condition of some of the schools (*ibid.* P. 198), and this "poverty" of so many of the parents engaged in agriculture in this country Mr. Fraser states to be, in relation to the question of enforcing a measure of school attendance, "the most formidable difficulty of all;" (A. 66, 78) and on this topic Mr. Fraser thus enlarges in a following paragraph:—

"It is, then, to the poverty of the parents, far more frequently than to their apathy or low moral tone, though there is an undefinable connection between the two, and people's moral tone is very much raised or lowered by the elevation or depression of their outward circumstances, still it is to their poverty mainly that we are to trace that irregular attendance during children's nominal school-life, and the premature termination of that life, which constitute the two great obstacles to the education of the farm labourer. With the value of every sixpence so appreciably brought home to their intelligence and with odd jobs of all kinds which children can do, and by which sixpences can be earned, so continually presenting themselves, it is a matter of regret rather than of surprise that parents of this, humble rank should not be superior to a temptation, the power of which no other class of parents can so fully feel. Here and there, one meets a parent who resists and conquers the temptation, and though the effort is made in a lowly sphere, the steadfastness of purpose it implies rises almost to the height of heroism; but the majority, it must be confessed, yield to it. And the natural result is the comparative failure of our schools." A. 78.)

Mode of securing due amount of education considered. Statistics of agricultural children below 12 years of age.

82. With these principles and clear facts before me I approach the consideration of what measure for securing a due amount of education for the children of the labourers in agriculture will best suit the peculiarities and the necessities of the case. The numbers to be dealt with may be judged of approximately from the figures of the census of 1861. There were at that date, of agricultural children engaged in out-door labour, males between 5 and 10 years of age, 6,996; between 10 and 12, 32,576, total males, 39,570; females between 5 and 10 years, 256; between 10 and 12 years, 1,264; total 1,520; total of both sexes employed under 12 years of age 41,090.

Half-day system and alternate day system both inapplicable

83. The question of the compatibility of the half day system, or the alternate day system, with the exigencies of agricultural employment, has been fully entered into by all our Assistant Commissioners. They have discussed it with a great variety of persons of great ability and competent experience, very many of whom are disposed to favour any means by which the education of the young in the rural districts might be most effectually promoted. But the uniform and unhesitating conclusion is that neither of those systems is applicable to the circumstances with which we have to deal. The following remarks of the Rev. John Wilkinson, "a zealous educationist," in his prize essay published in the journal of the Royal Agricultural Society on the farming of Hampshire, quoted by

Mr. Fraser state the reasons against both systems with conclusive effect:—

"Night schools," he says, "seems to have arisen naturally out of the necessities of the case, as the "best means of supplementing the inevitable deficiency consequent either on the early age at which "the day school is left for labour, or on an irregular attendance, or on no attendance there. They "may be taken to be one mode of proved efficacy for solving that difficult problem in the elementary "education of the labouring poor, viz., how to combine instruction with the demand for juvenile labour. "No other plan, such as half-day or alternate day schools, has yet been devised which is not open to "grave objections. A half-day system will not answer, because the boy has a whole day's work set "him, and that very possibly at a distance from home; alternate days will not answer, because every "workman's usefulness depends on his acquaintance with his work, and if he be away half his time he "is just twice as long learning his business; neither will master, bailiff, or headman be bothered with "teaching two sets of boys; they say one is trouble enough. Besides, where are the relays to come "from? At pressing times every boy and girl is wanted; and even for constant places, in parishes of "ordinary density of population, the supply of boys is not beyond the demand. There is no juvenile "reserve. The application of these schemes to an agricultural district is an impracticable theory. "They proceed on a mistaken analogy between manufacturing and agricultural operations. In the "one there is concentration of uniform work, under cover, in one spot, independent of season and "weather: in the other the work is spread over some square miles, is exposed to wet above and mud "below, varies with every season, and is dependent on every atmospheric change. From circumstances "so different the same practical conclusion cannot be deduced." (A. 86.)

84. A modification of the principle of the Printworks Act is as uniformly suggested as the only solution of the difficulty (A. 92, B. 221, C. 176, D. 78, E. 29, 30, F. 54, 66.)

A modification of the Printworks Act the only solution possible.

85. The particular modifications recommended by various witnesses and presented to us with more or less approval in the Reports of the Assistant Commissioners are of the following kind:—

86. Mr. Fraser thinks that,—

"The best mode of promoting the education of children in agricultural districts would be (1) to prohibit their employment on the land under the age of 10; (2,) to make provision for securing their regular attendance at school for the five years preceding that age, and in several cases the suggestion was added that (3), to prevent the possible loss by disuse of what they had attained, the children when emancipated from entire restriction should still be required to fulfil a certain amount of winter attendance, say 150 hours either at day or night school for two years more" (A. 94).

87. Mr. Henley states, regarding Northumberland and Durham, that,—

"If, on general grounds, it is thought necessary to lay down a rule on the subject it must be provided (in order to avoid injury to the district) that each child shall make a certain number of school attendances (say 150) in the winter months" (B. 221).

88. Mr. Stanhope is of opinion that,—

"To require 100 days school attendance in each year, from 8 to 13, would be to deprive the families of very little money and hardly to interfere for a single day with the requirements of the farmer." (C. 176, 179.)

But in a subsequent paragraph Mr. Stanhope states that,—

"12 would probably be a better age at which restriction should cease." (G. 147; C. 179).

89. Mr. Portman thinks the most feasible plan would be exclusion from work up to a certain age, and a certain amount of compulsory school attendance from that age to 13 or 14, together with the production of a school certificate of such attendance previous to hiring (D. 77); the periods of attendance to be made "elastic" enough to meet the necessities and irregularities of agricultural operations." (D. 78). Mr. Norman (E. 29) and Mr. Culley (F. 68, J. 71) take substantially the same view.

90. Individual recommendations received by the Assistant Commissioners are well represented by the following (J. 72.):—

"Rev. W. J. Dry, Chairman of the Bicester union, says,—

"I would restrict the age to 10, but as it often happens that a boy of 9 is physically stronger than one of 10, I would allow a boy of 9 to go to work if he could read and write fairly."

And the following is the opinion given to Mr. Culley by the Bishop of Oxford, on the application of the Factory Acts' principle to children employed in farm labour:—

"I think that, if the Factory Act principle is to be applied to farm labour, a child should be allowed to work half time at 8, whole time at 9 (if it can produce a certificate that it can read and write well), and whole time at 10 under any circumstances. Such a modification of the principle of the Act would quicken the sense of parental responsibility, and tend less than merely fixing an age (such as 10 years) under which no child should work to make parents depend on State aid, and would cause less necessity for an educational rate, which, I think, would at once stop voluntary aid, and put an end to religious teaching in our schools." (*Ibid.*)

91. Mr. Culley adds that these opinions are closely followed by the resolutions of the Hungerford, Bicester, and Bradfield boards of guardians. (*Ibid.*)

92. I have stated my reasons above (§ 69–75,) for the conclusion that the principle of excluding children from work below any age is inadmissible. I think that, in the numerous cases in which either the wages are low and precarious, or the children of a family all young, or the labour of children at an early age of great importance both to

the employer and the parent, I have shown it to be inexpedient and unnecessary that the Legislature should interfere with existing habits.

93. But allowing the employment of children in agriculture to proceed as at present (with the exceptions above indicated) I would endeavour to arrive at a satisfactory mode of securing a due amount of elementary education for these children by enlisting in its favour the interests both of the parents and the employer.

The particular modifications suggested.

94. The solution I beg leave to suggest is the following:—

First. That every child employed in agriculture should be under the obligation to complete 160 school attendances in each year from the end of its first period of employment until it attains the age of 12 years.

"Employment" should be defined to mean employment in any species of agricultural labour for a period or periods amounting on the whole to 72 week days (12 weeks) in any twelve months.

Secondly. The obligation of school attendances should be reduced to 60 for any child of the age of 9 years and upwards who passes an examination in the 4th Standard.

Thirdly. The obligation of school attendance should cease altogether for any child who at the age of 11 or at any time between that age and the completing of its 12th year can pass in the 5th Standard.

I beg to offer the following observations on this proposed arrangement:—

95. The number of 160 school attendances would require for their completi on 80 days There being five school days per week, the attendance would be completed in 16 weeks or four months.

96. The number of hours of instruction in these 80 days would, at five hours a day amount to 400 hours, or 100 more than are required in the year by the Printworks Act.

97. The number of 80 days is 20 days less than the number suggested in the evidence in some districts as capable of being given to schooling by the children of agricultural labourers during the intervals of their work in the course of the year. But in other important districts where the demand for children's labour is great, a larger amount of compulsory attendance at school would seriously interfere with agricultural operations (C. 139–143). In some, the children are employed six, seven, and even eight months in the year (A. 42 note, C. 176, D, 27, E. 12). In Mr. Fraser's district "the farmers "themselves constantly assert that though one part of the year may be busier than "another, it is very difficult to find an actually 'slack time.'" It appears to me, therefore, important not to exact an amount of school attendance which might be felt in many cases to be inconvenient or excessive.

98. But although the period of 80 days is less than many persons desire, the object held out of reducing the school attendance on passing an examination in the 4th Standard may be regarded as an equivalent, and more than an equivalent, for a greater prescribed amount of attendance. A larger amount without the prospect of an examination is obviously likely to be less effectual than a smaller amount with an examination in view, which will forward the interests both of the child and the parent. The prospect of such an examination of the child attended with such a result, may reasonably be expected to induce the parent to take every opportunity of sending the child to school during the intervals of its work, thus "utilizing" in the words of Mr. Fraser, "small scraps of time" (A. 43); perhaps causing the child to exceed the prescribed amount of attendances for the sake of passing the examination at the age of 9 or as soon after as possible.

99. I propose that these 80 days of school attendance should be taken at any time or times of the year, when the child is free from work. This permission undoubtedly opens the door to varying and uncertain periods of attendance, and therefore to that irregularity which has always been objected to as a defect in the Printworks Act, and it would certainly be desirable that the required attendance should be as much as possible regular within defined periods of the year; but the varying exigencies of agricultural work in all parts of the kingdom prevent this. In some districts the winter is a busy time of the year for children (A. 91; C. 13, 14, 49). In other districts, a part of the winter (A. 27, 42, note; C. 30; E. 13;) spring, summer, and autumn divide in most parts of the country with winter their demands upon the occasional labour of the young. It would be impossible without interfering in some districts with the natural and imperious demand for children's labour in agriculture to lay down a rigid rule that the school attendance of all below a certain age should be taken within certain prescribed months. But the absence of such a regulation will be compensated for by the proposed examination, and the end of any compulsory attendance will be to a great degree attained if at some period before the age of 12 a child shall be able to pass in the 4th Standard.

100. Supposing a child of 9 years of age to pass in the 4th Standard it will, according

to my proposal, be liable to a continuance of 60 school attendances per annum up to the age of 12 years.

101. These 60 school attendances in each year I contemplate may, since the child will have already passed in the 4th Standard, be safely allowed to be taken, if more convenient to the child or its employer, in the night school; and as night schools are seldom open more than three nights in the week, the attendance might possibly be spread over five months. If, on the other hand, they were taken in the day school at 10 attendances per week, the time occupied would be six weeks. But the required number should be allowed to be made up of attendances at both.

102. Had not such a child already passed in the 4th Standard, this amount of after attendance yearly would be but small. But it is acknowledged, on all hands, that when once a child has been able to satisfy the requirements of the 4th Standard, it does not readily forget what it has learnt, and that a moderate amount of after application is sufficient to keep up and extend it. Mr. Fraser thus expresses himself on this point:—

"I may add as the almost universal opinion of the most competent teachers, repeated to me again and again in the course of this inquiry, that a child who leaves school with a *smaller* stock of elementary knowledge than is denoted by the ability to pass an examination in the 4th Standard is not likely unless he has used some effective contrivance for retaining it, to be found in possession of much of that stock after two years working life in the fields" (A., note in p. 19). Mr. Culley also expresses his opinion to the same effect (F. 67, 68).

103. But as a premium on extending the amount of acquirement beyond the 4th Standard, I propose that any child who at the age of 11, or at any time between the age of 11 and 12 years, passes in the 5th Standard, shall be discharged from further liability to school attendance.

104. As the age of 11 is about the time when in most parts of the country the farmers want to take boys into continuous employment (even to go with horses in the counties where they are employed very early for that work, *supra* § 37) it will be to the interest of the employer to favour and encourage the early progress of boys at school, in order that, as soon as they have passed in the 5th Standard, they may be no more interrupted in their course of work (C. 174, F. 66, J. 70); and with regard to girls the 5th Standard is one which, if their attendance at school in their early years has not been neglected, they can, as a rule, have no difficulty in reaching by their 11th year, if it is any object to them to be released from the obligation of school attendance previously to the completion of their 12th year.

105. The 5th Standard implies an amount of elementary instruction which, when once acquired, may be looked to with confidence as fulfilling the object of early education, namely, that of imparting the power of reading, writing, and the use of arithmetic to the extent to enable and encourage the process of after instruction to be carried on by voluntary effort, and thus, in the words of Mr. Culley, "to put the career of every "child in his own hands" (F. 102.) The well-known results of all the efforts and all the expenditure on behalf of the education of children in the agricultural districts up to the present time is, that the great majority, on leaving school, do not pass in a higher Standard than the 3rd, large numbers only in the 2nd, and that consequently the little that has been learnt is soon forgotten, or not retained for much practical purpose.

106. By the Revised Code (Report for 1868–9, p. xxi.) the 4th Standard is intended to be passed by children between the ages of 9 and 10; the 5th between the ages of 10 and 11. My proposal therefore coincides with the expectations of the Revised Code. And the motives held out for beginning school attendance at an earlier age, and for greater effort while at school may be considered as equivalents for the number of attendances required by the Code.

Pecuniary effect as regards the parent.

107. It is desirable to state the pecuniary effect, as regards the parent, of requiring 160 school attendances for a child from the earliest age at which it is employed at agricultural work, "employment" being defined as "a period or periods amounting in the "whole to 72 week days, or 12 weeks in any one period of 12 months," in order to exclude the occasional work, for a very brief period, of very young children.

108. A very young child who has been employed as much as 72 week days, or 12 weeks in the course of a period of 12 months, will have been paid, say the minimum wage of 3*d.* per day, and will consequently have earned in those 72 days 18*s.*

109. It then falls under the obligation of attending day school for 160 attendances, or 80 school days, during the 12 months succeeding the completion of the 72 days above named.

110. At five school days per week these 80 school days will be given in 16 weeks, and at the usual school fee of 2*d.* per week, will cost the parent 32 pence or 2*s.* 8*d.*, leaving a balance in favour of the parent of 15*s.* 8*d.*

111. If in the first portion of the year next ensuing, 12 weeks only are occupied with work, and 16 weeks with the obligatory attendance at school, in all 26 weeks, there

125. If schools receiving annual grants were co-extensive with the educational wants of the country it might be easy to say that examinations might be held in them once in every [six] months, to give to children wishing to pass in the 4th Standard, in order to enable them to reduce their liability to school attendance to 60 attendances in the year, the opportunity to do so.

126. But as large numbers of schools are not even under simple inspection, and as examinations even twice a year, held under sufficient sanction, would not satisfy the necessities of the case, a more ready mode of obtaining such certificate must be resorted to.

127. It will be requisite to provide some such means as the following for the granting of certificates other than those granted after examination by inspectors of schools, namely, that in schools under certificated teachers, the certificate of the master or mistress, and of one of the school managers; in schools under simple inspection the certificate of the master or mistress and two school managers, or two responsible persons; and in the case of any other kind of elementary school the certificate of the master or mistress and two resident householders, rated at not less than *l.* per annum; may be granted at any time when any child may be able to pass such examination, and when the persons above designated may meet at the school for the purpose of examining such child, or children, and granting, if they see fit, such certificate. And to meet any possible difficulty interposed in the way of any child obtaining such certificate, by the reluctance of any of the persons designated above voluntarily to undertake the duty, it should be a condition with every certificated schoolmaster or mistress, that they should examine provisionally any child presented by its parent for examination (subject to re-examination at the next visit of the inspector of schools), on payment by the parent of a small fee, if there is any such school within four miles of the residence of such parent. This provision is analogous to that of the Workshops' Act, which exempts the parent from liability for the child's school attendance if there is no school within one mile.

128. The principle of allowing the teacher and managers of a school to hold an examination at any time has already been sanctioned by the Revised Code (Articles 142—9) in the case of evening schools. By Article 143 the applicants for permission to hold such an examination must pledge themselves that (exclusively of all the teachers of the candidates) at least two managers; or if only one manager, then such manager and at least one other responsible person, shall be present during the whole of the examination.

129. The form and substance of the certificate must be that of a thick card, of a size to permit its being enclosed in a large letter envelope (five inches by three and a quarter). It should contain printed words to the following effect:—

WE HEREBY CERTIFY
that
A . . . . . B . . . . .
has this day passed a satisfactory examination before us
in
the 4th Standard,
and that { he / she } wrote { his / her } name and the accompanying particulars in our presence.

Signed (see back) . . . . . .

(Signed)
A . . . . . B . . . . . aged years and months,
{ Son / Daughter } of . . . . and . . . . . of
This day of 186 .

130. On the back should be printed the instructions following:—

This certificate is to be signed,—
In schools under certificated teachers,
By the principal teacher and one of the school managers.
In schools subject to simple inspection,—
By the principal teacher, and by two school managers, or two responsible persons.
In all other schools,—
By the principal teacher and two resident householders rated at not less than *l.* per annum.

Standard 4 consists, by Article 45 of the Revised Code (1869) in:—1. Reading. A short paragraph from a reading book used [in the second class]* in the school. 2. Writing. A sentence slowly dictated once by a few words at a time, from the same book, but not from the paragraph read. 3. Arithmetic. A sum in compound rules (money.) *["A more advanced book" than the "elementary book" referred to in the previous Standard.]

Standard 5 consists, by Article 48 of the Revised Code (1869) in:—1. Reading. A few lines of poetry from a reading book used in the first class of the school. 2. Writing. A sentence slowly dictated once, by a few words at a time from a reading book used in the first class of the school. 3. Arithmetic. A sum in compound rules (common weights and measures).

131. I have ascertained from the Comptroller of Her Majesty's Stationery Office that such cards, with a moderately ornamented border and a device, could be furnished to the Education Department at a cost, including a strong envelope with printed device, for 72 pence per 100, or if several thousand were ordered at once, at 64 pence per 100.

132. It might be made an acceptable privilege to all certificated teachers to be the medium of distributing those cards to all who required them. On the application of a certificated teacher the cards might be supplied to him or her by the Department of Education at cost price, on the condition that they should be sold to all applicants at a moderate stated profit. They would thus be readily brought within the reach of every person in the country.

133. The teachers of schools not under certificated teachers, the parents of the children requiring certificates, or the clergy, or employers who might desire to have the certificates at hand for the use of the children of whose labour they wished to avail themselves, would have an easy mode of obtaining the certificates on application to one of the large body of certificated teachers now widely distributed over all parts of the country. If the teachers were empowered to sell them at 2*d.* each (the cost to the parent of one week's schooling) the profit to the teacher would afford some remuneration for the trouble.

134. I have said above that examinations held twice a year for the purpose of granting these certificates would not satisfy the necessities of the case, and it does not appear probable that public formal examinations could be held in schools under the Education Department even as often as twice a year. In all schools not under the Education Department there is no security that any formal public examination would be held at all. But even more frequent examinations at set times in elementary schools of any kind would not meet the requirements in this matter either of the parent or the employer. A child may not be ready for examination, or may not pass, at the periodical examination, yet may be ready and able to pass within a short time after. It may be a matter of importance, in reference to the seasons for particular kinds of work, that a child should, by passing in the 4th Standard as soon as it is ready to pass, be freed from the liability of the longer period of 160 school attendances in the ensuing year. These are my reasons for proposing to keep open the door for a child to pass an examination, under the guarantee against abuse designated in the terms of the certificate, at any time when the persons named to be entrusted with the power of granting it can be got together. An employer anxious to effect this would have no difficulty in doing so. The parent probably would have as little, and in the last resort would always, as proposed, be able to present his child for examination before a certificated teacher, if there should be one within four miles of his residence. He would be under a strong inducement to cause his child to attend the best accessible school, and the system would greatly increase the demand for schools of the best kind.

135. To prevent a collision of interests between the teacher receiving the capitation grant and the parent, some arrangement would be necessary to insure the teacher against loss in the event of a child passing in the 4th or 5th Standard before completing the number of attendances required by the Education Department to entitle the teacher to his grant.

136. My third suggestion above (§ 94) was, that the obligation of school attendance should cease altogether at the age of 11 for any child who at that age, or at any time between that age and the completion of its 12th year, can pass in the 5th Standard.

137. The mode of obtaining the certificate of this amount of acquirement would be the same as that above described for passing in the 4th Standard. The certificate should be printed with a sufficient amount of coloured ornament to add an additional value to it as pleasing the eye, and causing it to be prized and exhibited as a satisfactory record of the child's progress on leaving school. I have ascertained, as above, that the cost of the certificate for the 5th Standard, printed in two colours, would be a very small fraction only beyond the cost of those of the 4th Standard. They might therefore be permitted to be sold by the teachers at 3*d.* each. On obtaining this certificate the child would be entitled to accept permanent employment free from all further obligation to school attendance, to the benefit of the farmer as well as to that of the parent.

138. "Permanent employment" should be held to mean employment for any period or periods amounting on the whole to six months in any 12 months. In this case it would be just that the penalty attaching to the employment of a child under the age of 12 years without the certificate of having completed 160 school attendances, or, having passed

On child being continuously employed, penalty for

employment without certificate should attach to employer as well as parent.

in the 4th Standard 60 school attendances, within the period of 12 months, or that such child had passed in the 5th Standard, should fall upon the employer as well as upon the parent. The age of 11 is that at which it has been shown that in most counties boys are taken into permanent employment, "to go with horses," and for other purposes. When permanent employment once begins the farmer is very urgent that there should be no further obligation to attendance at school. This being so, the employer will be desirous that the child should pass at the age of 11, and may reasonably be called upon to prove, by the production of the certificate, that he is not violating the law.

Probable satisfactory results.

139. I am of opinion that if the plan I have ventured to sketch out should be embodied in legislation it would be found to act in a manner satisfactory both to the parent and to the employer, and that a generation would not pass before it had greatly contributed towards conferring on the children of the labourers in agriculture the inestimable blessing of a sound elementary education.

This anticipation depends on the passing of a general measure for supplying schools where now wanted.

140. This anticipation necessarily depends for its realization on the fulfilment of the expectation of the country that some measure will shortly be adopted by Parliament for causing the want of good schools to be supplied wherever they are now deficient.

141. Mr. Fraser's conclusions from his inquiries under the Duke of Newcastle's Commission, and from the facts presented to him in the districts which he visited under this Commission in the counties of Norfolk, Essex, Sussex, and Gloucester, are that there is "a paramount pressing immediate necessity for improving the condition of two-thirds "of our existing schools" (A. 54). This opinion is to a great extent confirmed by the inquiries of our other Assistant Commissioners in the counties of Lincoln, Nottingham, Leicestershire, Rutland (C. 117–19; G. 101), Yorkshire, Cambridgeshire, (D. 53–4.) Beds and Bucks (F. 43–50), Chester, Salop, Stafford (G. 102), and Hants, Devon, and Cornwall (H. 77–86). But in all these counties there are parishes and whole districts fairly supplied with schools, both in respect to number and quality.

Reasons why Government should have power to cause such schools to be provided after due notice.

142. The counties reported to us to be best supplied with schools both as to number and quality are Northumberland and Durham (B. 103–121), Dorset and Kent (G. 101), Northamptonshire (E. 25), Oxford and Berks (J. 56–9), portions of Somerset (K. 29), Surrey, Wilts, Warwick, Worcester, and Hereford (I. 68), and Cumberland, and Westmorland (L. 89). But in all these counties there are, in some localities, schools of inferior quality greatly needing some external action to bring them into a state of efficiency.

143. The circumstance to which this inefficiency of existing schools and their frequent absence altogether is attributed is "the inadequate support that schools too often receive "from the landowning class" (A. 55). On this subject Mr. Fraser makes the following observations:—

"The influence that most powerfully depresses the condition of the inferior schools is their poverty —poverty arising not so much from want of means as from illiberality in the use of means, and an indisposition to apply them to this particular object. In my report to the Education Commissioners of 1861 I thought it my duty to call public attention both to the general fact of such indisposition and also to some flagrant individual instances, and I published a table, which attracted some notice and which the Commissioners used as a basis for some emphatic remarks on the inadequate support that schools too often receive from the landowning class, showing the sources of the income arising from voluntary contributions of the schools in 168 rural parishes. I could easily accumulate, were not the task invidious and unwelcome, fresh instances of the same kind; and no language can be too strong to describe the straits to which schools that ought to be flourishing in affluence are frequently reduced, and the efforts that have to be made by zealous managers, struggling against their circumstances, to keep them afloat at all.

144. Mr. Culley's remarks are to the same effect. Noticing the fact that "great progress "has evidently been made within the last few years in the supply of schools," in Oxfordshire and Berkshire, and that "in this respect these counties contrast favourably" with those he had already reported upon, Mr. Culley proceeds to say that he found in those counties "the same inequality in the efficiency of the schools and the same "unequal pressure on the resources of their supporters" which he had observed elsewhere, and of which he gives the following instances:—

As a rule, a heavy share of the burden of the school falls upon the clergyman, who, if he possibly can, bears it without complaint rather than give any occasion for such State interference as might deprive him of the authority in the management of the school which he now possesses. In a few cases, especially of parishes owned by non-resident landowners, the burden is so great as to drive even the clergyman to ask for some legislative action, which may compel the owners of property to bear a fair share of the expense of supporting the school.

In some cases one resident landowner is obliged to do duty for his absent brethren, even though his pecuniary interest in the parish is much smaller than theirs.

I beg, for instance, to draw your attention to the state of matters educational in Bampton Aston parish, as described by the Rev. G. S. Griffiths (see Oxon evidence 27). This parish, which has, or had at the last census, 968 inhabitants, contains 3,760 acres, whose rateable value is about 5,000*l.* a

year; and the following are the contributions to the National schools given by the chief landowners for some years past:—

St. John's College, Oxford owns 410 acres, rateable value 991*l.*, has given nothing for 11 years.

A non-resident landowner owns 800 acres, rateable value 1,000*l.*, has given 5*l.* during 11 years.

A non-resident landowner owns 1,869 acres, rateable value 2,531*l.*, has given nothing for many years.

A non-resident landowner owns 356 acres, rateable value 506*l.*, has given nothing for many years.

From Mr. Griffiths' account there appears to be about 14*l.* a year from charity funds and available for educational purposes.

As another example of what an absent or peculiar proprietorship sometimes entails on the clergyman, take Steventon parish, in Berks, of which the Dean and Chapter of Westminster are lords of the manor, the property being, I believe now in the hands of the Ecclesiastical Commissioners. An excellent school was erected in 1864, which with its surroundings cost 1,066*l.* 8*s.*; towards this sum the Dean and Chapter of Westminster gave 100*l.*, and the vicar 433*l.*, the other subscriptions chiefly from individuals resident in the parish amounted to 130*l.* 10*s.*, and the rest of the money was supplied by sale of old school, Government grant, &c. (see Berks evidence 46a). In fact, the vicar gave twice as much as the absent landowners and all the other residents in the parish put together. This parish has about 900 inhabitants and contains about 2,400 acres of rich land. (J. 69.)

145. The fact adverted to above (s. 142), that fifteen counties are fairly supplied with schools, and that good progress has been made in the rest (s. 141), appears to afford ground for expecting that the deficiencies would in most cases be supplied by voluntary effort if, as has been already proposed to Parliament, power were vested in the Government to compel, after due notice, a satisfactory provision of the means of elementary education in each parish or district proved to be in want of it.

Action of such plan of enforcing school attendance would be facilitated if labourers' resources improved.

146. The action of the above described plan of enforcing upon the children employed in agriculture a certain amount of attendance at school previously to the age of 12 years would be greatly facilitated and strengthened by any means which improved the pecuniary resources of the agricultural labourer. Improved pecuniary resources would enable the parents to send their children to infant schools where accessible, and to keep them longer and more regularly at the ordinary day schools.

147. The evidence shows that in many localities there is an increasing appreciation among the parents of the blessings of education for their children, and an increasing desire, even occasionally among the poorest, to make self-denying efforts to procure it for them. Where the school is good, and where also zealous personal influences are brought to bear on education, the labouring poor are found willing to respond. In such cases there is, among all parties, "activity, interest, co-operation, progress" (A. 64, 65). In Northumberland and Durham, Mr. Henley found that the parents "felt it to be their sacred duty to secure for their children the best instruction in "their power, and *that* they are determined they shall have" (B. 28), and even the poorest are "sent to pick up a bit of schooling where they can" (B. 66). Mr. Stanhope, speaking of certain districts, says that indifference of parents does not appear to be as common as might be supposed. "* * Few poor families do not profess at any rate to see the "advantage of education, and the promotion of private adventure schools in the poorest "districts, and the eagerness of the poor to avail themselves of any opportunities afforded, "prove that in many districts they do set a value upon it. They have known cases "where some in their own station of life have raised themselves by means of it, and this "in itself is a strong inducement to them to seek it for their children" (C. 150). Mr. Portman speaks of "an increased desire for education" (D. 55). Similar opinions are expressed in other portions of the evidence. It is reasonable, therefore, to infer that increased pecuniary resources on the part of the parent would be widely taken advantage of by him to procure a larger amount of education for his child.

Means by which their resources might be improved.

148. That being our impression, we devoted a considerable portion of our First Report to directing attention to some of the principal means by which the pecuniary resources of the labourers in agriculture might be legitimately increased, and by which their general condition, both physical and moral, might be improved, and as a consequence, the salutary progress of education among them might, as appears probable, be greatly promoted.

149. After touching upon the importance to the employer, as much as to the labourer, of "a high rate of remuneration as the best means of obtaining a good day's work;" upon the effects of a good nourishing diet upon the physical strength of the labourer, and its economical results (First Report, s. 147); and upon the beneficial consequences of enlarging the field of employment by the application of more capital to the land, and the consequent power imparted to the labourer, under proper direction, of fairly earning the higher rate of wages (*ibid.*, ss. 148–9), we showed by a great mass of testimony what a valuable auxiliary toward improving both the physical and moral condition of the labourer

existed in the practice which, though much increased of late years, is still far from being as general as it ought to be, of attaching good-sized gardens to agricultural labourers' cottages, or, in default of gardens, assigning field allotments to them as near to the cottages as possible.

The value of good-sized cottage gardens and of field allotments.

150. The value of this boon to the labourer, in a moral quite as much as in a pecuniary point of view was exhibited by us on irrefragable evidence, derived from a great variety of sources, from the end of the last century to the present time. Among other documents we referred to the evidence given before the Select Committee of the House of Commons on Waste Lands in 1795; to the action, in its favour, of the Board of Agriculture in the year 1800; to that of the "Society for Bettering the Condition of the Poor," shortly after that date, and the active exertions of Mr. Wilberforce and Sir Thomas Barnard; to the evidence given before the Select Committee of the House of Commons on emigration in 1827; to that of the Select Committee of the House of Commons in 1843 on the results of the allotment system, and on the inclosure of waste lands; and to much that has been laid before us by our Assistant Commissioners in the course of the present Inquiry.

Public allotments out of waste lands under General Inclosure Act.

151. As it was upon the Report of the Select Committee of 1843 that the General Inclosure Act of 1845 (8 & 9 Vict. c. 118.) was passed, and as that Act, following the recommendations of the Committee, empowered the Commissioners (by ss. 31 and 108) to apportion, in all cases coming within their discretion, a public allotment, out of the waste lands to be inclosed, for the labouring poor, and directed them, in all cases where they have not made such allotment, to state in their annual report the grounds on which they have abstained from requiring the appropriation of such an allotment, we were led by our knowledge derived from the evidence above adverted to, of the great value to the labouring poor of such allotments, to consult the reports of the Inclosure Commissioners, in order to ascertain the quantity of land so appropriated under that Act since it became law in 1845. There being no summary of the quantity of land so appropriated in the reports of the Inclosure Commissioners, I constructed the table given at s. 296 of our First Report, which, on its being submitted to the Inclosure Commissioners, they considered substantially correct.

Reference to in our First Report.

152. We called attention in s. 247 of our Report to the apparently small proportion which the amount of land assigned in public allotments bore to the total amount inclosed. We gave reasons, drawn from the debates in Parliament and from the terms of the Act, why it appeared to us that in assigning public allotments to the labouring poor, the wants not only of the present labouring population should be considered, but those of the future population which would be called into existence to cultivate the land when inclosed. We suggested that, "it would be highly desirable that a return of the quantity of land "throughout the country occupied in cottage gardens and field allotments, should be "made from each agricultural parish," and that "such a return would probably be "attainable with very little additional trouble at the same time that the annual agricul- "tural returns are collected by the officers of the Inland Revenue Department, under "direction of the Statistical Department of the Board of Trade." And we stated that as "the officers of the Inland Revenue Department now issue forms to every occupier "of land for obtaining the acreage under agricultural crops, one more form would enable "them to collect the information required; and that the total for each county would "find an appropriate place in Table No. 5 of the returns as given for 1867, under a "heading of 'Acreage in Cottage Gardens and Field Allotments.'"

153. We intimated also (ss. 298, 299 of our first Report) that inasmuch as among the reasons assigned by the Inclosure Commissioners in their annual reports for not making allotments in certain cases to the labouring poor, one was that, "the poor had gardens "already," such "a statement of the total acreage in each county occupied by cottage "gardens and in field allotments would enable any person to see, by reference to the "column in Table No. 3 of the Agricultural Returns, giving the total area in statute acres "under farm cultivation in each county, whether or not the proportion occupied by "cottage gardens and field allotments was satisfactory, regard being had to the total "number of heads of families engaged in agriculture in the county (which is approxi- "mately ascertainable from the census) and to the proper average size for a cottage "garden and field allotment."—1st Report, s. 236.

154. We intimated further, that although Parliament had (by ss. 108 and 109 of the Inclosure Act), provided the machinery for securing land as allotments for the labouring poor, both the public and Parliament is in ignorance as to whether the allotment wardens are acting or not, and whether consequently the Act has been properly carried into effect. (s. 318.)

155. These statements having attracted the attention of the House of Commons, the Annual Inclosure Bill of this year was referred to a Select Committee. Having been called before that Committee and examined, I had the honour of submitting the several points which the investigation of the subject in our Report had suggested as worthy of the consideration of the Committee, with reference to enlarging the powers of the Act in the interest of the labouring poor. The Annual Inclosure Bill of year referred to a Select Committee.

156. The Report of the Committee embodies the following recommendations in reference to six of the points adverted to. (1.) That the reports of the Commissioners should contain more precise and minute statements of information on various matters in which the interests of the labouring poor are concerned. (s. 8.) (2.) That the maximum quantity of land which may be allotted by the allotment wardens should be extended to half an acre (from one quarter of an acre) in certain cases. (s. 11.) (3.) That the Inclosure Commissioners should be authorized to require the allotment wardens to furnish every three or five years reports of the state of the land, and the rents paid by the tenants under their management. (s. 15.) (4.) That a power of sale should be given to the allotment wardens to enable them to sell allotment land when inconveniently situated, in order to purchase land more convenient. (s. 17.) (5.) That a column should be added to the third table of the Agricultural Returns of Great Britain, compiled by the Statistical Department of the Board of Trade, showing the acreage employed in cottage gardens and allotments; this information, the Committee state, "would be useful in many ways and would render the Statistical Table "more complete." (s. 20.) (6.) The Committee also express their opinion that in considering, in any case, whether the extent of public allotment proposed by the Inclosure Commissioners to be appropriated is sufficient, among the elements to be taken into account should be the number of persons coming under the designation of labouring poor not only now residing, but "likely hereafter to reside at convenient distances" from the land about to be inclosed, and consequently the "future capacities of the land "after it has been broken up." (s. 3.) Result.

157. These conclusions of the Select Committee afford the justification to us for having, in the discharge of the duty imposed upon us by our Commission, which raises the entire question of the condition of the labourers in agriculture in all its aspects, thought it incumbent upon us to draw the attention of Parliament to the question of the manner in which the waste lands of the country had been, and were being, disposed of. That the matter is one of great importance to the labouring population is manifest from the facts which we have stated in our 1st Report, s. 264, namely, that although between the date of the first Inclosure Act in the year 1710 and the year 1867, 7,325,439 acres have been inclosed (all but the mountain portion of it being inclosed for the purpose of cultivation), there still remained, according to the evidence laid before the Select Committee of the House of Commons on Emigration in 1827, and according to estimates furnished by the Tithe Commissioners to the Select Committee on Commons Inclosure in 1844, about 4,000,000 acres in England and Wales capable at the latter date of being brought into cultivation. The total inclosed, cultivable and uncultivable, between 1845 and 1869, has been, according to the Return of the Inclosure Commissioners made to the House of Commons dated 9th April of this year, 507,700 acres.

158. Among the points submitted by me to the consideration of the Committee, were :—(1.) That the total results of the operation of the General Inclosure Act, since the commencement of the Act in 1845, should be tabulated from the Reports of the Inclosure Commissioners in a certain form, which was laid before the Committee (Evidence, p. 80). The total results given in the return of April 9th, adverted to in the last paragraph, is under three heads only, "Total acres allotted," "Acres reserved "for exercise and recreation," "Acres reserved for the labouring poor." Upon this return the Committee remark that the estimate that three-fifths only of the acreage inclosed was subject to the discretion of the Commissioners, in reference to their power of making allotments to the labouring poor, is based upon an assumption, and "must "therefore be regarded as merely a rough estimate" (s. 1). It would manifestly be a satisfaction to the public to know precisely, if possible, the ratio between the total acreage inclosed and the total number of acres appropriated to the labouring poor. (2.) That the constitution of the board of allotment wardens should be altered from that of the clergyman, one nominee, and one elected member, to the clergyman, two nominees, and an elected member. The suggestion was founded on the fact that, in many cases, the allotment wardens do not act, and in others exceed their powers (s. 14 of Report of Committee). The object in view was to secure to the clergyman the assistance in the management of the allotments of two gentlemen of influence and independence in the parish (Evidence,

p. 82). The recommendation of the Committee in s. 15 of their Report, that the allotment wardens should be required to furnish, every three or five years, reports of the state of the land, and the rents paid by the tenants under their management, will enable Parliament to see whether their duties are henceforward properly discharged. (3.) That the Act should permit the allotment land to be let at a higher rent than that prescribed by it (namely, "such a rent as it would bring for farming purposes"), and that the proceeds should not, as now, be necessarily applied in aid of the rates, but might be applied in hiring or purchasing more land to be let to the labouring poor (Evidence, pp. 80 and 82), as that been suggested by Mr. Bailey Denton. The Committee expressed the opinion (ss. 16 and 17) that the proceeds "might in some cases be employed "in improving or fencing the ground, or in hiring or purchasing land, either larger in "extent or more conveniently situated."

159. The Committee have added several other recommendations arising out of the evidence, which will doubtless tend to protect and promote the interests of the large portion of the labouring classes concerned in the results of the inclosure of waste lands.

But even if pecuniary resources increased, and education consequently extended, its results liable to be counteracted by state of labourer's dwelling.

160. But greatly as any legitimate increase of the pecuniary resources of that large proportion of the labourers in agriculture throughout the country which is in the receipt of the lower rates of wages might be expected to further the progress of effectual education among their children, the good results of such education must be liable to be counteracted in all the, unhappily, still very numerous ceses in which the labourers' dwelling is of such a kind as to cause great and serious discomfort, and to make the decencies of life all but impossible.

161. In our First Report (ss. 319–332), we referred to the fact that the evidence collected by our Assistant Commissioners proved that in every county visited by them up to that time many landowners, both large and small, had within the last 30 years expended in the aggregate immense sums in improving and enlarging old, and providing new cottages on their estates, and that great efforts had been made by individuals and societies in all parts of the country to direct the most serious attention to what remained to be done towards placing the agricultural population generally in a satisfactory state in regard to their dwellings.

162. The evidence laid before us by the Assistant Commissioners this year from the remaining half of England is to the same effect.

163. The picture indeed of the wants of the country in this respect presented by the whole of the reports of the Assistant Commissioners for both years is, notwithstanding all that has been done, of a very serious nature.

State of labourers' dwellings as described by all the Assistant Commissioners.

164. It is impossible to do justice to this subject except by bringing together and presenting to the eye at once the general conclusions of each Assistant Commissioner in each Report.

165. Mr. Fraser thus describes the condition of the cottages in the counties, and parts of the counties, he visited, namely, Norfolk, Essex, Sussex, and Gloucestershire :—

"It will be observed, upon reference not only to my notes of meetings, but to the special body of evidence upon this subject collected out of my returns, that nothing can be more wide-spread than the feeling entertained, nothing can be stronger than the language used, about the general condition of the cottages of the peasantry, certainly in every one of the agricultural districts, almost in every one of the parishes, which I have visited. In one return they are described as "miserable;" in a second as "deplorable" in a third as "detestable;" in a fourth as "a disgrace to a Christian community." Even where they are spoken of in favourable terms, it will generally be found that if adequate in quality they are inadequate in quantity; and that some rich landowner, "lord of all he surveys," and having exercised his lordship by evicting so much of his population as were an eyesore or were likely to become a burden to him—still employing their labour but holding himself irresponsible for their domicile—has, by a most imperfect system of compensation, built a limited number of ornamental, roomy cottages, which he fills with his own immediate dependents. Out of the 300 parishes which I visited, I can only remember two—Donnington, in Sussex, and Down Amney, in Gloucestershire—where the cottage provision appeared to be both admirable in quality and sufficient in quantity; and I mention these cases with the greater pleasure, because in each the landowner, though not resident, is as willing to recognize and as careful to discharge his responsibilities as though he were.

"The majority of the cottages that exist in rural parishes are deficient in almost every requisite that should constitute a home for a Christian family in a civilized community. They are deficient in bedroom accommodation, very few having three chambers, and in some parishes the larger proportion only one; they are deficient in drainage and sanitary arrangements; they are imperfectly supplied with water; such conveniences as they have are often so situated as to become nuisances; they are full enough of drafts to generate any amount of rheumatism; and in many instances are lamentably dilapidated and out of repair.

"The natural history, so to call it, of these miserable, ruinous dwellings is very various. Some of the worst are parish cottages, either erected in the time of the old poor law or bequeathed to the

parish as a last home for its aged paupers, which there are no funds to repair. Another almost uniformly bad class are the cottages run up by squatters on the waste, or held upon a lifehold or copyhold tenure, and which have not yet fallen in to the lord of the manor. Others have been put up by speculative builders of the flimsiest materials. Others are converted stables or farmhouses, attesting in the one case the conquest of the railway over the road, in the other the change in the phase of agricultural life which has merged half a dozen petty occupations into one large holding. Some belong to small proprietors too indigent to have any money to spare for their improvement; some to absentee or embarassed landowners, the former of whom are unwilling to improve an estate which they never see, the letter, in addition to being unable, are equally unwilling to improve a property from which they get no advantage.

"It is impossible to exaggerate the ill effects of such a state of things in every aspect—physical, social, economical, moral, intellectual." (A. 113–116.)

166. The great expenditure on cottage improvement in Northumberland and Durham of late years enables Mr. Henley to say that although "some of the worst in England" are still to be found there, all deficiencies will "soon be supplied." (B. 147, 161, 176.)

167. Mr. Stanhope states that in Lincolnshire, although the number of cottages built on many estates within the last few years has been very large, yet "on some few of the "large properties" which he visited "hardly any improvement has taken place." * * "Some few of the villages in the east of Notts are still full of bad cots." * * In "Leicestershire the cottages must be described as generally bad. Their average state "is far below that of Lincolnshire." (C. 186, 188, 189.)

168. Mr. Portman states that—

"The feeling expressed at meetings of boards of guardians and others, both in Cambridgeshire and Yorkshire, on the subject of cottage accommodation shows that there is great need for improvement, and that it is a question towards which landlords should, without delay, turn their attention." (D. 88.)

169. In Northamptonshire Mr. Norman states that although in the close parishes "a "great number of new cottages are being, or have recently been built" of excellent material, and of suitable accommodation, their number is still "frequently, if not generally, "quite insufficient." On the other hand, in the open parishes, where the cottages belong principally to small owners, "cottages of every description may be found, but rarely, if "ever is the accommodation sufficient to provide for the health, comfort, and morals of "the inhabitants." (E. 41, 42, 47.)

170. Mr. Culley gives the following description of the cottages in a considerable number of parishes in Bedfordshire and Buckinghamshire:—

"In about half of 55 parishes the cottages are described as good, fairly good, or generally good; in all of these, except one, the cottage property belongs either altogether or in part to the chief landowners; in the remaining half of these parishes the cottages are described as either mixed, bad and good, or generally bad, and in these cases the ownership is usually described as 'various' or 'chiefly small proprietors,' or it is said that many cottages are built on the waste and belong to the occupiers, in which last case they are always described as bad.

"Except where they belong to chief landowners, and in some cases even then, the cottages are generally described as lacking accommodation necessary for a family. Where cottages belong to chief landowners sufficient outhouses are generally, but not always, provided. The cottages built on speculation are very deficient in outhouses. (F. 70.)

"In 30 of 79 parishes in Bucks of which the cottages are described they are said to belong altogether or chiefly to the principal landowners, and of these 30 cases 14 may be said to have the cottages described as generally good, 11 as fairly good, 4 as mixed good and bad, and 1 as generally bad.

"In 42 cases the ownership is described as various; in 6 of these cases the cottages may be said to be described as fairly good, in 28 cases they are described as mixed good and bad, and in 8 cases as generally bad. (*Ibid.*)

"The above evidence will, I think, justify an opinion which I hold very strongly, that it is a great misfortune for the agricultural labourers in these counties that so small a proportion of their cottages belong to the chief landowners; when they do there is somebody to care for the manner in which the poor are housed, somebody to be ashamed of a bad state of things, somebody upon whom the pressure of public opinion may be brought to bear; when they do not the labourer has either to rickle up a miserable hut for himself or pay an exorbitant rent for a house in which the ordinary decencies of life become a dead letter." (F. 72.)

171. In his Report of this year, Mr. Stanhope, while recording the fact that in Dorset the greatest improvement had taken place within the last 27 years, and that "the great "majority of landowners had effected great changes on their estates," nevertheless adds that,—

"In spite of these changes the cottages of this county are more ruinous and contain worse accommodation than those in any other county I have visited, except Shropshire; and it must be remembered that the system of hiring adopted here would especially seem to require a sufficiency of bed-room accommodation. The estate of Lord Rivers, having been long held by life tenants, is notorious for its bad cottages. And such villages as Bere Regis, Fordington, Winfrith, Cranbourne, or Charminster (in

which there is an average of 7 persons to a house), together with others described in the evidence, are a disgrace to the owners of the land, and contain many cottages unfit for human habitation. Nor can this condemnation be confined to large open villages. The parish of Batcombe for instance (with an acreage of 1,109) has within its limits 23 cottages occupied by agricultural labourers, of which 11 have one bedroom only, and in five of these families with three or more children are sleeping (Evid. 59). In the 42 parishes comprised within the unions of Cerne and Wimborne, no less than 314, or 16 per cent. of the cottages had one bedroom only, and 113 of these contained a family with three or more children (Evid. 59). What is called a second bedroom is often too a mere apology for it, and is sometimes described as "a closet not closed" from the bedroom. One special difficulty in the way of improvement in this county should, however, be mentioned. It is the number of cottages let on lease for lives, and until these fall in, the landlord has no control, and no power of effecting such improvement. It is to be regretted that some are still being let on these terms." (G. s. 18).

172. Of the cottages in Kent, Mr. Stanhope thus speaks:—

"'Cottages,' says one witness at Maidstone, 'are bad generally, and insufficient in number' (Evid. 81), and yet it appeared to me that they were better than in any county that I have visited. In very many villages some landowner is resident, who is anxious to see the cottages present an agreeable appearance, and the flowers, which it is the common custom of the cottagers in this fruitful county to cultivate, render many of them especially attractive. On one estate the appearance of the village, in which the residence of the owner is situated, creates universal admiration, but (as often happens), his whole attention appears to have been concentrated on this one place, and on the rest of the estate the complaints are loud of the want of sufficient cottages." (G. s. 30.)

"In East Kent, in some cases I noticed that the great want of cottages had caused tenants to put up temporary wooden huts on their farms, in which the accommodation was most indifferent." (*Ibid.*)

173. The cottages of Cheshire are thus described:—

"The cottages, as I have already stated, are too few in number, and not very well distributed. The old black and white materials of which many are constructed present a picturesque appearance, but such cottages generally are in very indifferent repair. In respect of bedroom accommodation considerable changes are wanted, for though on some estates (such as that of Lord Westminster) very great progress has been made, on others no improvement has taken place, and must unfortunately be further postponed by the terrible calamity of the cattle plague." (G. s. 57.)

174. Shropshire, unhappily, stands conspicuous for the badness of its cottages. Mr. Stanhope says (ss. 60, 61),—

"The point especially deserving of attention in this county is the infamous character of the cottages. In the majority of the parishes that I visited they may be described as tumble-down and ruinous, not water-tight, very deficient in bed-room accommodation, and in decent sanitary arrangements. On the whole they are more uniformly bad, and are being less altered for the better, than in any other county visited by me. Two at least of the principal landowners in the north of the county have cleared themselves of the reproach of owning bad cottages by pulling them down, without adequately replacing them by others. On these estates the labourers herd in the open villages, while on many others cottages are to be found, belonging to the owner of the soil, which are a disgrace to any civilized country. In one parish, out of 62 cottages owned by large landowners, 29 have one bedroom only, while out of 36 owned by railway and small proprietors only seven have this limited accommodation. (Evid. 196.) I would call your especial attention to the detailed account of the cottages in the villages visited by me.

"With this state of things it is very difficult for those charged with the education of the poor to contend. 'I find from questioning the boys to-day,' says the schoolmaster at Clun, 'that all but one half of them belong to families living in cottages with one sleeping room.' (Evid. 174.) 'It is an insuperable obstacle,' says another witness, 'to a proper education.'"

175. The state of Staffordshire is thus described:—

"The exhaustive return contained in the appendix (Evid. 215.) gives a complete account of the state of the cottage accommodation. In the 63 parishes from which returns were received no less than 25 per cent. of the cottages had only one bed-room, and 9 per cent. contained a family with three children or more living in that one bed-room. I found, however, that considerable improvement is taking place, and on some of the larger estates good cottages are now the rule." (G. s. 67.)

176. Respecting the cottages in Hampshire, Cornwall, and Devon, Mr. Portman thus speaks (H. 128–130):—

"It appears from the above extracts from the evidence, that in Hampshire there is not much cause for complaint as to the state of the cottages, but that much has of late been done towards their improvement. The probable reason for this satisfactory state is, that there are many large resident landowners in the county who devote their attention to the welfare of the labouring class living on their properties, and that in many parts of the county there is a class of farmers holding a great number of acres, and willing to aid in the march of improvement.

"On the other hand, the accounts of cottages in Cornwall and Devon are not, with some exceptions, at all satisfactory. In the first-named county it would seem that the tenure by leases on lives does not conduce to a good state of dwellings, neither the lessee nor the landlord being interested in repairing them.

"In Devon with the exception of the estates of a few landowners, the cottages are in a deplorable state, more especially in the Honiton Union, and in the district near to Holsworthy. The farms are for the most part very small, the occupiers men of no capital, and last, but not least, the possessors of the land are too often absentees, so that the profit of the land is spent elsewhere, and bestows no benefit on the district from which it is drawn."

177. With regard to Surrey, Wilts, Warwick, Worcester, and Hereford, Mr. Norman classifies the cottages as belonging: 1st to landlords, 2nd to speculators, 3rd to labourers, and built by themselves. A great deal has been done and is doing by the first-named class, both in building new and very commodious cottages, and improving old ones. The cottages built by speculators are described as greatly inferior in accommodation in very respect, to those above-named. The 3rd class of cottages, Mr. Norman says, were "decidedly the "worst." They are "generally constructed of wattle and dab, and thatched, and con- "tain only a bedroom and one sitting room" * * totally destitute of drainage, and in very bad repair (I. 123). Mr. Norman's general conclusion is, "that it is very "seldom there is a sufficient supply of cottages with two or three bedrooms, and cases of "serious overcrowding may be found if looked for in almost every parish." Also that the medical men to whom he spoke on the subject, "are with three exceptions unanimous "in condemning the cottage accommodation as totally inadequate to secure the health "of the inmates." (I. 125.)

178. Of the counties of Oxfordshire and Berkshire Mr. Culley gives a full and particular account of the cottage accommodation in proportion to the wants of the land for the purpose of cultivation, showing both a considerable deficiency in quantity and a very unequal distribution. (J. 76–78.) Of his inquiries in Oxfordshire, Mr. Culley thus states the result:—

"What I have said above of the proportion of cottages belonging to the landowners in Woodstock and Wantage unions may, I think, be taken as a fair sample of the two counties, and shows how far the landowners are from fulfilling the condition of providing cottage accommodation sufficient for the labour required on their estates, making no such deduction as, I think, should be made where the cottages are not attached to the farms, as is the case in these counties." (J. 79.)

179. In his address to tenant farmers and occupiers (see Berks Evidence 89), Mr. H. R. Eyre says:—

"In a return which I have of the number of cottages in the Newbury union, it appears that of 2,155 cottages in the rural districts, 622 only are the property of the landowners; and as many of these 622 are occupied by gamekeepers, gardeners, and other servants of the landowners, the proportion of those occupied by the agricultural labourers is proportionately reduced."

180. Of the parishes which Mr. Culley visited in Berkshire he gives a list of 11, "in "which the cottages were good, and provided with all necessary conveniences."

"In all of them the cottages belong to the landowners, and except in West Challow and Farnborough, are immediately under the eye of the owner. Farnborough is not far from the residence of the owner and belongs to an estate which is better supplied with cottages than any other in the union of Wantage. West Challow presents a case where an absent landowner attends to the home comfort of his labouring tenant. In this village the cottages are old, but roomy and comfortable, and are particularly well kept by the inhabitants, showing a very marked contrast, both inside and out, to the cottages in the neighbouring open village of East Challow, though the same active pastoral care is constantly at work in both parishes." (J. 80.)

181. In the 10 open, or quasi-open, parishes which Mr. Culley visited, he saw "the "largest proportion of bad cottages." (*Ibid.*)

182. Of the county of Somerset Mr. Boyle says that—

"A special complaint that he found urged by all classes alike was 'on the deficiency of cottage accommodation throughout the whole of the west of England.' * * * The worst cottages are generally the small freeholds, inhabited by the persons who own them, and who being unable to make more money than absolutely necessary for their immediate wants are too poor to afford repairs of any kind. Next to these the worst class of buildings are generally those belonging to small proprietors, such as tradesmen in towns, who have invested in them as a money-speculation, and to make it pay are forced to charge a high rent and spend little in repairs. The best cottages are usually those belonging to the larger proprietors, most of whom, from a wish either to see the estate present a flourishing appearance or to see their people well off, charge a rent far too small to repay them for their outlay; but it must be remembered that it is only a rich man who can afford such munificence." (K. 36.)

183. In his description of the state of things in the counties of Westmorland and Cumberland, Mr. Henry Tremenheere states as the general results of his observations and inquiries, that the cottage accommodation, notwithstanding all that has been done by the comparatively few large landowners in those counties, is still very defective.

"In 18 parishes of Cumberland, the cottages in the returns are described as more or less deficient in proper sanitary arrangements, with little attention paid to ventilation, often without the accommodation required for a decent family. From Westmorland the reports are equally unfavourable." (L. 80.)

184. Mr. Henry Tremenheere adds—

"Cottage improvement was often impressed upon me by the clergy as the question of the day, for 'how,' they justly reasoned, 'can we influence a class by schools when the houses they live in are overcrowded, dirty, and often without the requisites of decency and comfort." (L. 81.)

Influences of good cottages said sometimes to be overrated. External circumstances may counterbalance their injurious influences.

185. It is indeed sometimes argued that the influence of a good and commodious dwelling is overrated; that the Northumberland peasantry, as described by Mr. Henley, are shown to possess high and admirable qualities notwithstanding the very unsatisfactory condition of their dwellings until a very recent period; that education and intelligence has made great progress among the Scotch, and yet their cottages are, as a rule, small and deficient in proper accommodation, and that none of the immorality said to arise in England from the small and crowded cottages is visible among the Irish cottagers. The habit of early marriage in the latter case, and external circumstances in the two former may be acknowledged as capable of arresting or mitigating influences tending in themselves to evil; but if health and decency and delicacy of mind are liable to be impaired by the habits forced upon the occupants of small and crowded dwellings, and if the absence of the possibility of privacy and quiet must necessarily obstruct the progress of home culture, the instances in which populations have, more or less slowly, triumphed over those obstacles to moral and intellectual improvement afford no solid ground for continuing such obstacles in other cases if they are capable of removal.

186. An opinion analogous to the one combated above, exists in some quarters, to which expression is given by Mr. Norman (I. 131–2), that the improvement of the labourer must precede the improvement of the cottage; that otherwise improved cottage accommodation will not be considered by the labourer a boon to him, and he will make no effort to occupy a better cottage than the one he has been brought up in, or abstain from overcrowding it with lodgers if he is placed in one. On the other hand it is said that when he can command higher wages he will demand and pay for a good cottage.

187. The far more general opinion is, that it is not to be expected of the existing class of labourers that they should shake off at once the feelings and the habits that have been contracted in the crowded hovels in which they have themselves been reared (J. ss. 80, 81); but that it is of the utmost importance to their children that they should not grow up under the same circumstances. (K. 38). But it may be safely asserted that a large proportion even of the existing adult labourers are sufficiently enlightened to appreciate the comfort to themselves, and the value to their children, of better dwellings, and that if put into them, their habits will improve, while their children will have been saved from the contaminating influences which depress their moral sense, and counteract the effects of education.

Legislative action invoked to cause improvement.

188. And so strong is that opinion in many quarters that the action of the legislature is loudly invoked to facilitate and hasten such a change.

189. On these points I beg to refer to the following statement of opinion from persons in every respect qualified to pronounce one. The Rev. H. T. Young states,—

"I do not think that the moral and physical condition of the labourer can be raised and improved until proper dwellings are provided for him; the overcrowded state of many of the present cottages is injurious to health and the constitution, and the intermixture of sexes which it causes prevents the nurture of the proper feelings of decency, and where these are wanting, chastity will be wanting too. I am satisfied from observations which I have made during a period of 35 years passed in the ministry of the church, that before our teaching and preaching can have the effect we look for we must house the labourers in a better manner."—(J. 86, note.)

190. Mr. J. L. Goodlake, chairman of the Farringdon union, says,—

"I fear school and church are utterly powerless in the presence of the complete disregard of decency to which the poor are exposed; indeed the practice of modesty in the case of females is scarcely practicable. Where a third sleeping room is provided it is usually let, if the poor are left to themselves. This is prevented in the case of villages belonging to single owners. In the four parishes I have named there is nothing to be desired in the way of water or ventilation; the remaining parishes vary in the supply of water and as to ventilation, from indifferent to very bad. I should like to add that, in my opinion, the provisions of the Common Lodging Houses Act might advantageously be applied to the best interests of the poor by compelling all houses under 6*l.* a year rental to come within its ambit. The erection of proper cottages is simply a luxury in which the more wealthy alone can indulge, the capital sunk in their erection being completely unremunerative." (*Ibid.*)

191. Mr. H. Tucker, high sheriff of Berks, says:—

"In 1859 I obtained, at my own cost, a return of all the cottages in the Farringdon union, showing the number of rooms in each, and the number, ages, and sexes of their inhabitants. From these returns I sent a digest to 'The Times,' which was published and produced a great sensation at the time."

"I urged several members of parliament to bring the matter before the House of Commons, with a view to obtain a similar return for the whole of England, believing, as I still do, that there is no other way of getting at the real state of misery and degradation in which a large proportion of our agricultural labourers and artizans are housed, and this opinion is confirmed by all that has been done by government and is still being done to obtain information upon this subject. The means adopted can never secure the desired end." (*Ibid.*)

192. Mr. W. Menzies, deputy-surveyor of Windsor Forest, says:—

"It is quite evident to every one that much of the unhealthiness and immorality, both in cottages and villages, arises from the bad condition of the dwelling-houses of the labouring classes, and as the effects of these evils fall upon the community generally, the Legislature is entitled to deal with the matter. . . . . .

"As the law stands at present, it is the duty of no one specifically to interfere with these matters and say where they are wrong; but however difficult and formidable a work it is, every one who sees the effects is, I believe, convinced that some change for the better must be attempted." (*Ibid.*)

193. Mr. H. R. Eyre, chairman of the Newbury union, in his address to landowners, entitled "A Voice from Berks," says:—

"Some general and extensive plan of housing the labouring poor must be devised, and the private rights of landowners must not be an obstruction to it—some plan which shall not depend upon the indulgence or the accidental benevolence and liberality of individuals — some plan which shall recognize the personal liability of proprietors of all classes for the state and condition of their house property.

". . . . . Let us urge upon the government and our legislature to take parliamentary action in the business and duty of housing the people, that the resistance of ignorance, indifference, and self-interest may be overcome, and that the partial efforts which have already produced an instalment of what is due to the requirements of the people, may be aided and supplemented by a general movement in the same direction." (*Ibid.*)

194. In his "Address to Tenant Farmers and Occupiers of Land in Berks," the same gentleman says:—

. . . . . "Some say, indeed, that this matter (the supply of proper cottage accommodation) is better left to the operation of the principles of political economy. I am surprised at the suggestion, and more surprised at the source of it, because it not only seems to ignore all moral and social duty in the matter, but it seems to ignore a fact which a little thought and a little inquiry would disclose: that the system of land tenure in this country, and the difficulties connected with the transfer of land, render the principles of political economy practically inoperative. If it were not so, we should not now be deploring the want of cottages; we should not have to complain that the supply does not keep pace with the demand. . . . . .

"What, I would ask, has made the present but the past, and what is to make the future but the present? If we would not hand down to posterity an evil which we deplore ourselves; if we would not perpetuate a system which helps to corrupt and demoralize our people; if we would not forfeit the blessings we enjoy, we must at once put our hands to a work which will be twice blessed, blessed to him who engages in it, and to him who has the benefit of it.

"I am very well aware that there are landowners in Berkshire who have been long engaged in remedying the evil which is complained of, but the problem to be solved is not who is building and who is not building cottages, but how far the work ought to be optional and discretionary, whether any safeguard should be established against a public evil, partly arising from the right of ownership, and what security the tenant farmer and the people should have that the agricultural labourers should be well and sufficiently housed.

". . . . . I propose, then, that we petition parliament to promote by further public measures the necessary work of providing additional habitations and homes for the people, and to find a national remedy for a national grievance." (*Ibid.*)

Different classes of estates on which bad cottages are found.

195. Our Assistant Commissioners distinguish the following classes of estates on which bad cottages are found. They are thus more particularly described by Mr. Portman, Mr. Culley, and Mr. Norman. (H. 135, I. 121–3, J. 82.)

1. The most favourable class of estates is the one free from incumbrances and unentailed, but still not yielding an income sufficiently large to enable the possessor to spend more than a small sum annually in improvements.
2. The large and scattered estates that have been entailed for generations and considerably incumbered.
3. The small estates, in good order, but incapable of bearing such extra charges as would be required under the existing law, enabling money to be raised for improvements.
4. The neglected estates of absentee landlords.
5. The properties of small owners who have built cottages on speculation in the "open" parishes and villages.
6. The properties of small freeholders, usually labourers, who have built their own cottages.

196. On the first four cases described above Mr. Portman and Mr. Culley make the following important observations. Mr. Portman says:—

"It has been suggested to me that not only should the present regulations as to the borrowing of money be altered and made less expensive, but that in some form more enlarged powers should be given to owners of life estates to charge their property within certain specified limits for improvements and for cottages.

"I would venture to suggest for your consideration whether it is not expedient that legislation should take place in such a direction as to bring into the market these large tracts of incumbered land, enabling those who have capital to acquire such land if they desire so to do, and conferring

a boon on those who now possess them by giving them money to spend on such an amount of territory as they wish to concentrate round their homes, while at the same time the curse of poverty and misery will be removed from those districts whence all the profit is drawn, and to which none returns. Bad cottages would, I think, then become more rare; a portion, at any rate, of the profits would be spent upon the spot; a more contented race of farmers and of labourers would be found; and the education of the people, now flagging for want of funds, would progress.

"Some may say that this question of the dwellings of the poor in agricultural districts is a passing question of the hour, and that it is not really so great an evil as is represented. I would answer, 'Go into the country and see for yourself. Use your common sense, and call to mind the effect of absenteeism on Ireland; and then say whether or not in those portions of England where poverty and misery arising from the same cause meet you at every step, there is not urgent reason for dealing with the evils now existing, by some legislative enactment, which shall put an end to a state of apathy and indifference in many holders of incumbered estates, and open the doors for the spending of capital on land by those who *are* able, in the place of those who are now unable to do so." (H. 136–8.)

197. Mr. Culley states the grave questions that arise under this head for consideration, as follows:—

"There constantly arises to me, and I doubt not to my colleagues, the feeling that in speaking of the state of cottages I am exhibiting a dark picture, as if it was the fault of a class, many of whom are powerless to change it, and few of whom are answerable for it.

"We are calling upon the landowners of to-day to remedy the evil growth of many past generations, and nine-tenths of those who reside in the four counties which I have visited under your orders are already busy at the work as far as their means will allow.

"I could point out to you two very large estates in these counties, upon the general improvement of which, cottages having a large share, the whole income has been spent for many years past, and will probably, if the present owners live, be spent for many years to come. What can a landowner do more? How many landowners are in a position to do as much? And above all, what must have been the condition of these estates to demand such a sacrifice from the present owners?

"What then has led to the state of labourers' dwellings being such as to justify men in speaking of it as a national disgrace? And why are so many landowners now powerless to deal with it?

"If I were to answer these questions, judging from the history of the estates I have visited, I would answer at once, the encouragement given by law to the creation of limited interests in land and the power of entailing burdened estates.

"What can the poor life-tenant, especially if his estate be burdened, do towards providing good cottages for his labourers? Nine times out of ten he strives to do his duty and suffers fully as much as the ill-housed labourers on his estate.

"The unhappy propensity to create limited interests and entail burdened estates tells hardest against the smaller properties, where, if the owner lives as all the world expects him to live, there is no margin left for estate improvement, especially cottage improvement; even on a large estate, by the time all is done for which farm tenants most loudly call, unless the burdens be light, or the owner unusually self-denying, there is very little left to expend in the expensive luxury of cottage building.

"The case of the small estates, however, is the worst, and in spite of the supposed protection of the law of entail, they are being swallowed up by their larger neighbours, or are passing into the hands of men whose whole means are not invested in land. Would it not be better that they should be allowed so to pass before they have inflicted undeserved suffering on everybody connected with them?

"If, however, the labourers on the estate of an ordinary life-tenant are, as far as their cottages are concerned, in a bad way, the labourers on the estates of collegiate and ecclesiastical bodies, and all corporate bodies, whose members manage and divide the income of the estate, are in a much worse; the life-tenant has a conscience, but the corporate landowner has none, and the system of beneficial leases, to which some of them still cling, is simply an abomination.

"It may be said that by the Act 27 & 28 Vict. c. 114. authorizing the Inclosure Commissioners to advance public money for the improvement of land, including the erection of labourers' cottages, and to sanction such loans from public companies, the legislature has acknowledged the evils arising from the settlement of estates, and has already provided means, as far as it prudently can, by which a life-tenant can execute all desirable improvements on his estate without altogether sacrificing his own interest or that of his successor.

"With regard to general estate improvement, especially drainage, which was the motive power for this legislative action, I think this provision, as far as the action of the legislature is concerned, is sufficient, and that 25 years, the usual time allowed for the repayment of such loans, is not too narrow a limit. The rapidity with which the first Government loan was consumed, and the large sums now yearly advanced by public companies under sanction of the Inclosure Commissioners is enough to prove this, as well as to prove how great an impetus this legislative action has given to the productive power of the country.

"With regard to cottage improvement the case is altogether different, the rent of a cottage (even adding an estimated pecuniary value for the indirect advantages arising from good cottages, which as you say in your first report "are not appreciable by all persons,") is so far below the rent-charge necessary to repay in 25 years the loan contracted for its erection, that few life-tenants can be expected to take advantage of the Act to which I am referring." (J., 82–84.)

Scope of Act giving power to charge settled estates should be enlarged.

198. We called the attention of the Assistant Commissioners to the Act 27 & 28 Vict. c. 114., giving power to charge settled estates for the improvement and building of cottages, in order that they might invite information as to whether any additional facilities were required, or any reduction of cost practicable, by which greater progress might be made in supplying the want of good cottages. Mr. Culley shows in detail why the powers of

the Act are not as extensively used as is desirable, and he adds two valuable suggestions for meeting the difficulty; first by extending the duration of the rent charge, secondly by allowing the tenant for life to borrow as owner in fee for cottage building. Similar suggestions are also made in the reports of Mr. Portman, Mr. Stanhope, and Mr. Norman. G. 160, H. 136, J. 84, K. 39.)

Question of extending principle of Artizans and Labourers Dwellings Act to rural districts.

199. Two other Acts are also adverted to by our Assistant Commissioners, as likely, at a future time, to be brought to bear, by an extension of their powers, upon the correction of overcrowding, and upon the provision of proper cottage accommodation. A widely expressed desire that the powers of the officers under The Nuisance Removal Act should be enlarged, and their independence secured, has led to the appointment of the commission now investigating that subject. The Artizans and Labourers Dwellings Act of 1868 (31 & 32 Vict. c. 130.) has established a precedent which, although confined at present to towns having upwards of 10,000 inhabitants, is likely, after some experience has been gained of its working, to be gradually extended until, if successful, it embraces the whole country. The preamble of this Act is as follows:

"Whereas it is expedient to make provision for taking down and improving dwellings occupied by working men and their families which are unfit for human habitations, and for the building and maintenance of better dwellings for such persons instead thereof."

200. By this Act the expression "owner" in addition to the definition given in the Lands Clauses Act, "shall include all lessees or mortgagees of any premises required to "be dealt with under this Act, except persons holding or entitled to the rents and profits of "such premises for a term of years of which twenty-one years do not remain unexpired."

201. By s. 13 power is given to the local authority to enforce the Act. If the local authority neglects to enforce the Act the Secretary of State has power to compel it. By ss. 18 and 19 if the owner neglects to execute the work required of him the local authority may do so and obtain from a court of quarter sessions an order charging the premises with the amount of the cost, which charge has priority "over all other estates, "incumbrances, and interests whatsoever," with certain exceptions mentioned in s. 26, such as quit-rents incident to tenure, tithe commutations, rent-charges, and other charges created under Acts of Parliament.

202. The very grave questions relating to settled and incumbered estates which Mr. Portman, Mr. Culley, and others of the Assistant Commissioners have felt it their duty to raise for the consideration of Parliament and the public, cannot be rightly approached by any one who is not able to embrace in one view the whole course of legislation upon this subject.

203. I therefore venture to present this view in the briefest terms possible.

Origin of "strict settlements." View of the course of legislation in regard to entailed and incumbered estates.

204. The origin of "strict settlements" out of which has grown the habit of incumbering estates is described by Professor Stephen in his Commentaries, vol. i., p. 237. The method of limiting legal estates according to the modern system was invented by Sir Orlando Bridgeman and other eminent lawyers during the civil wars "to secure "family settlements from the wrongful acts of tenants for life during those disturbed "times." The device was adopted by those lawyers of appointing a trustee to support the contingent remainders and thereby "to secure in family settlements a provision for "future children of an intended marriage, who before were usually at the mercy of the "tenant for life"; and when, after the restoration, those eminent men came to fill the "first offices of the law they supported this invention *within reasonable and proper* "*bounds* and introduced it into general use." Settlements in this form were termed "strict settlements."

205. In the event of its being considered by Parliament that the disadvantages to the public interests arising out of this system require its modification, such modification would be in entire harmony with the whole course of legislation on the subject of entailed estates from the times nearest to those of the first statute that favoured them—the statute de Donis, in the year 1285,—to the present day.

206. Sergeant Stephen in his Commentaries points out that entails were "ever looked "upon with much disfavour," and that the whole course of the statute law since A.D. 1285 has been "towards their relaxation," of which he enumerates the proofs.

The 12 Edw. 4 (1472) abridged their duration;
The 4th Hy. 7th allowed the inheritance to be cut off by a fine;
The 26th Hy. 8th deprived them of their freedom from forfeiture;
The 33rd Hy. 8th rendered estates tail liable for debts due to the Crown;

The 21st James 1st rendered them subject to sale in case of bankruptcy;
The 3rd & 4th Wm. 4th c. 74. enabled the tenant in tail to aliene in fee simple absolute without the old process of fine and recovery;
The 1st & 2nd Vict. c. 70. rendered an estate tail liable for ordinary debts.

207. A relaxation of the law as to strict settlement would only follow up this course of policy.

208. The bonds under which the tenant for life of a settled and incumbered estate is often placed have, in point of fact, been to a certain extent relaxed on various points by the legislation of the last 30 years.

209. In the year 1840 the Act 3 & 4 Vict. c. 55, passed "to enable the owners of settled "estates to defray the expenses of draining the same by way of mortgage." This Act established the important principle that "the owners of settled estates might charge "them for a certain number of years with the cost of durable improvements though "the owners creating the charge might not live to see the borrowed money repaid."

210. In the year 1847 "The West of England Land Drainage and Inclosure Act" (11 & 12 Vict. c. 142.) enabled the owners of settled estates to charge them in perpetuity,—*i.e.*, without any obligation to repay the principal, and consequently without any cost to themselves.

211. The "Public Money Drainage Act" (1846), "The Private Money Drainage Act" (1849), "The General Land Drainage and Improvement Act" (1849), "The Lands Improvement Company's Act" (1854), and "The Land Loan and Enfranchisement Company" (1861), have powers to charge the inheritance for terms varying from 22 to 50 years.

212. "The Lands Improvement Act" (1864) adds the important privilege of enabling the owners of limited estates to subscribe to railways and canals, the construction of which may benefit their estates.

213. Finally the Act "to facilitate the leases and sales of settled estates" (19 & 20 Vict. c. 120.) enables the Court of Chancery in certain cases to empower leases, including mining, building leases, &c. as well as agricultural, to be granted for terms of years that may extend beyond the life of the tenant for life, and under certain circumstances to empower a portion of the inheritance to be sold to pay off the incumbrances on the remainder.

214. But, as our Assistant Commissioners have noticed, these Acts fall short of the requirements of the case.

215. As regards their effect upon the building of cottages by money borrowed under any of these Acts, it appears, by a return forwarded to us by the Inclosure Commissioners of those built under their sanction as required in such cases, that their number, between 1863, when the system commenced, and 1867, amounted to 509 only, or at the rate of 127 a year.

216. And as regards general improvements the total expended under all these Acts since 1840 is calculated by Mr. Baillie Denton as averaging for England and Wales not more than £300,000 a year (on Land Improvements by Mr. B. Denton, London, 1868).

217. Also as to the Act last adverted to, for the sale of a portion of a settled estate to pay off incumbrances on the remainder, it is liable to be obstructed in its operation by two of its sections; 1st, by section 17, which provides that "the refusal of any one" of numerous parties, having any beneficial estate or interest "however remote under the "settlement" shall prevent any thing being done under the Act; and 2ndly, by section 36, which enacts that "no powers given by the Act shall be exercised if an express "declaration or manifest intention that they shall not be exercised is contained in the "settlement or may reasonably be inferred therefrom or from extrinsic circumstances or "evidence."

218. The provisions of these sections are in harmony with feelings and opinions still widely prevailing on the subject of the disposal of property, and largely influencing legislation up to a very recent date, as was seen during the discussion in the House of Lords when the Bill on which "the Leases and Sales of Landed Estates Act" was founded was under consideration. These feelings and opinions still lead the legislature, in the words of Professor Stephen, (Commentaries, vol. i., p. 247,) "to pay greater regard to the "private will and intentions of the donor than to the propriety of such intentions or to "*any public consideration whatsoever.*"

219. These were in effect the words of the Lord Chancellor (Cranworth) and of Lords Campbell, St. Leonards, and Derby, during the discussion of that Bill in 1855. They all placed the will of the donor above all considerations of private interest or public policy. The Lord Chancellor defended the Bill on the express grounds that "the Court "of Chancery would have the power of authorizing the sale of an estate only when it "did not appear on the face of the settlement that such a sale was contrary to the wish "of the settlor." Lord Campbell although recognising the fact that the Bill "would "tend to the better cultivation of the soil and add to the general prosperity of the "community," justified it only on the condition of its not interfering with the will of a testator or settlor as expressed in the settlements.

220. The evil results of the practice of heavily burdening settled estates were adverted to by Lord Cranworth during the debate above referred to (May, 1855). Affirming that the law of settlement had "on the whole been conducive to the welfare of "individuals and beneficial to the community," Lord Cranworth said that "he was not "blind to the evil results that were connected with them. He desired their Lordships "to contemplate what those results had been. In consequence of the owner not being "the absolute owner, he was not able to deal with his property in the most beneficial "manner, sometimes for himself and his family, and in other instances for the community "at large." And Lord St. Leonards, in March 1856, on that Bill being re-introduced expressed a strong opinion to the same effect, namely as to the great tendency in the present day on the part of tenants for life (on re-settling estates) to throw prospective burdens on the remainder men, than which nothing could be more injurious to the objects which it was the end of settlements to accomplish. His words were,—

"There was a great tendency in the present day on the part of tenants for life, and persons having limited interests, to throw all expenses of improvements upon the remainder men, and nothing could be more injurious to the objects which it was the end of settlements to accomplish. The result of such a system, if permitted and realized, would be as was the case in Ireland, that no man would succeed to an unincumbered estate, and there would arise the necessity of selling settled estates in order to pay off the charges upon them." (Hansard.)

221. It has been shown (ss. 165–197) that a large proportion of the great and flagrant defects still existing in the manner in which the agricultural labourers of this country are housed is traceable to this system of "strict settlements," and the consequent habit of incumbering settled estates. It has been shown (s. 204) that this system is of comparatively recent origin, dating only from the end of the 17th and the beginning of the last century. If Parliament should now recognize it as in a serious degree injurious to the public interests, its comparatively recent origin would make it less difficult to bring it back "*within the reasonable and proper bounds*" contemplated by its inventors, as stated in the passage already quoted from Stephen's Commentaries. (*Supra*, s. 204.)

222. An absolute power given to every one who succeeds to an incumbered estate to sell as much of it as is required to pay off the incumbrances would have a strong tendency to keep settlements within those bounds, and would prevent their being exceeded for any length of time to the injury of the public.

223. The example of what has been done in Ireland is very suggestive of what might be done in this country. The Landed Estates Court. (Ireland.)

224. In the year 1848 the Act was passed "to facilitate the sale of incumbered estates "in Ireland."

225. In 1855, in the course of the discussions in the House of Lords on the "Leases "and Sales of Settled Estates Bill" (England and Ireland) opinions were expressed that "the Irish Incumbered Estates Court must either be abolished or extended to other "estates whether incumbered or not." Such a Bill was soon after introduced and became law in 1858.

226. In March 1856, during the discussion upon the Bill, Lord St. Leonards gave it as his opinion that if a Bill of that nature passed for Ireland "it must be adopted in "England, otherwise the great boon of a parliamentary title would give Irish property "a greater value, and place English property at a disadvantage."

227. In 1858 the Act "to facilitate the sale and transfer of land in Ireland" passed, applying to all estates whether incumbered or not, and constituting a permanent court (the Landed Estates Court,) from which, among other great boons, a parliamentary title can be obtained.

228. The result of the working of this Act in the first four years after it came into operation is given in a return to Parliament of 1st May 1862. I do not find that any later return has been made.

229. According to the return of 1862 the amount of business brought up and transacted by the "*Landed Estates Court*," was as follows:—

(From 1st November 1858 to 31st December 1862.)

Petitions for Sale by Incumbrancers.	Orders made thereon.	Petitions for Sale by Owners of Incumbered Estates.	Orders made thereon.	Petitions for Sale by Owners of Unincumbered Estates.	Orders made thereon.	Petitions for Declarations of Title.	Orders made thereon.
673	654	433	416	97	95	20	19

230. And by a return of the same date "of purchase money paid or to be paid into "the *Landed Estates Court* from the date of its institution (1st November 1858) to the "present time" (31st December 1862), it appears that the total amount of purchase money amounted to 5,940,989*l.* 13*s.* 4*d.*

231. I have been favoured by the Registrar of the Court with the information that the purchase money from June 1860 up to the present time amounts to 12,577,598*l.*

Probable effect of similar or equivalent measures for England.

232. If it should please Parliament to adopt a similar or some equivalent measure for England, it cannot be doubted that a very large amount of fresh capital would immediately be applied to the land, supplying proper buildings of all kinds where required, improving the cultivation of the soil, adding, in the words of Lord Campbell (s. 219) "to the general prosperity of the community," and, in particular, raising the condition of the agricultural labourers by creating a greater demand for more effective and intelligent services at higher wages.

233. Should the result of the inquiries of the recently appointed sanitary commission be that it should be found practicable to establish in each county or union a highly qualified sanitary authority, in communication with the Secretary of State, whose combined action may cause the want of proper cottage accommodation to be everywhere supplied, on the principle of the Artizans and Labourers Dwellings Act, such an authority would be practically powerless in regard to incumbered estates as long as the owner is able to plead that the state of the law prevents his relieving himself of his incumbrances.

234. The action of such an authority would be of great value also in respect to other than incumbered estates only. It is much wanted in reference to the outlying portions of the large estates of wealthy landowners, who in relation to those outlying and often widely scattered portions (scattered often over several counties) are absentees, and seldom witnesses of the defects requiring to be remedied; also in reference to the estates of collegiate, and ecclesiastical and other corporate bodies. (*Suprà*, s. 197.)

A return as to houses, similar to that of the Scotch census, desirable for England and Wales.

235. It would probably tend still further to fix public attention to the state of the labourer's dwelling if a return for England and Wales were made in the next census similar to that which was made for Scotland in the census of 1861.

236. In the English census the number only of houses is given—a return interesting and important in itself in showing that the inhabited houses in England and Wales had increased from 1,575,923 in 1801 to 3,278,039 in 1851, and to 3,739,505 in 1861, being an increase in the interval between 1851 and 1861 of 461,466. But of the nature of these houses there is in the English census no information.

237. In the census of Scotland, on the contrary, the following most striking facts appear:—

There were in Scotland, in 1861, 7,964 families (or 1 per cent.), living in single rooms which contained no window.

There were 226,723 families who lived each in one room, being 34 per cent. of the whole.

There were 246,601 families, equal to 37 per cent. of the whole, who lived each in houses of two rooms.

A similar return in the next census for England and Wales would show to what extent cottage accommodation was still deficient; and in what counties there still remained the largest amount of deficiency to be supplied.

Benefit Societies.

238. We directed the attention of the Assistant Commissioners to the question of benefit societies in their bearing upon the habits of providence of the labourers in agriculture. Mr. Culley, Mr. Stanhope, Mr. Portman, and Mr. Norman have contributed a very valuable amount of information upon the subject; but it is one of far too wide a nature, embracing as it does the town as well as the country populations, to be capable of being exhaustively dealt with in the course of our inquiries.

239. The facts and opinions brought together by our Assistant Commissioners only confirm what has long since been widely known, that the labouring poor suffer to an enormous extent by the unsound basis on which, as a general rule, their benefit societies are founded, and by the mismanagement and fraud with which they are so often conducted.

240. The consequence is that, in the words of Mr. Stanhope (G. 201):—

"The confidence of the poor has been to a great extent shaken by the failure of the club on which they or their father have relied. In hundreds of cases, after years of patient self denial, and saving against a day of trouble, the poor labourer has been sent on the parish, because there is nothing 'in 'the box of his club,' or because, as he and others were getting old and were likely soon to come upon its funds, the younger members of his club have dissolved it, and reconstituted it without him. More often again he is the victim of mismanagement. The money is carried off by a treasurer, whom the law in many cases cannot touch; or that which ought solely to be kept for the future requirements of sick pay is spent upon the temporary enjoyments of the annual feast. Still more constantly the poor ignorant man is ruined by a miscalculation. How is he to know that the monthly sum he is called upon to contribute is utterly inadequate to enable the society to fulfil the expectations it holds out? There is no one to tell him so, his neighbours are joining, and he is led to begin a sacrifice which from the first is certain to prove useless." (G. 201.)

241. To this Mr. Stanhope adds that—

"If the value of the friendly society in raising the moral and social condition of the labouring class, and in effecting a most important reduction in the poor rate, be remembered, no one can doubt that every encouragement should be given to men who are anxious to join them, and to their formation on a trustworthy system." (G. 203.)

242. With respect to what a trustworthy system is, and to the actual state of untrustworthiness of nearly the whole of the enrolled benefit societies, and of the whole of the unenrolled, the following opinion of the Registrar of Friendly Societies, Mr. Tidd Pratt, is thus given in the Report of the Western Provident Association for 1868:—

In referring to causes retarding the progress of a sound and enduring system, by which the great masses of the working class may make adequate provision against the evils attendant on sickness and death, the Board think it desirable to call the attention of the members on the present occasion to some of the prominent facts made public by the annual reports of Mr. Tidd Pratt, the Registrar of Friendly Societies.

IN THESE REPORTS THE REGISTRAR HAS CLEARLY SHOWN THAT THE ESSENTIALS OF A SAFE SYSTEM ARE:—

1. Rates of contribution adequate to provide the benefits promised, and to accumulate the funds necessary to meet the growing liabilities incident to the constantly increasing ages of the members; and adjusted to the risk incident to the different ages at which members join.
2. Distinct funds for each benefit.
3. Periodical examinations by competent and independent actuaries.
4. Sufficient numbers of members, and extent of area, to ensure the natural average of sickness and mortality.
5. The safe investment of its funds.

And he shows that the prominent evils in the prevailing systems of clubs and societies arise not only from the want of some or all of these requirements, but also from the absence of any real unity in the apparently large institutions which, notwithstanding their profession to the contrary, are really only a number of small clubs, with distinct funds and interests, united only in name; and he further points out the evils caused by the public-house habits, too often originated and fostered by such societies.

On a recent occasion the Registrar publicly stated his opinion "that out of 25,000 enrolled societies, "large numbers of which fail and disappear every year, he did not consider that 20 of them were "absolutely safe;" whilst of the unenrolled societies, the severe and searching actuarial examination we hold to be essential to safety, has proved that there is not one in a sound and healthy condition. The thousands of societies that have become extinct, and the thousands that, based on the same fallacious principles that brought ruin and destruction to their predecessors, still continue to hold out delusive and flattering promises never to be realised, only afford too melancholy evidence of the extent to which the industrial classes are defrauded of their hard-earned and ill-spared savings for the time of sickness and trouble.

243. Mr. Culley gives a full account of the suggestions which a considerable amount of experience has enabled Captain Dashwood to make for the formation of benefit societies on a sound basis (J. 92). Mr. Norman calls attention to the admirable constitution and working of the Wiltshire Society, established in 1827, under the presidency of the Right Hon. T. H. Sotheron Estcourt. The Hampshire Society, founded on the same principles as those of the Wiltshire and Surrey, is described by Mr. Portman, together with the Western Provident Association, whose reports show that it embraces in its operation upwards of 80 towns and parishes in the west of England. Mr. Norman refers also to the North Warwickshire Friendly Society, founded about 25 years ago by Sir Charles Adderley, on rules substantially similar to those of the Wilts Society; also to some excellent societies in Northamptonshire, Worcestershire, and Herefordshire. Mr. Stanhope

also mentions the societies of Kent, Dorset, Shropshire, and Rutland, as founded on a sound basis.

244. The difficulties in the way of forming sound benefit clubs in the agricultural districts are noticed by Mr. Stanhope as involving the following questions:—1. Higher rate of payment. 2. The discontinuance of the meetings at public houses, and the annual display and the annual feast. 3. The uncertain way in which boards of guardians deal with the fact of a man belonging to a club or not.

"Some never recognize, in giving relief, the fact of a man belonging to a club; others do take it into consideration, and some refuse relief altogether. More often they are guided by no fixed or uniform rule. In some parts the labourers are said actually 'to have framed their clubs with special 'reference to additional help from the rate.'" (G. 206.)

245. Mr. Stanhope justly remarks that,—

"It is most surprising that the question, which yields to no other in importance, What is the best way of administering out-door relief so as to give encouragement to provident habits? is not only not answered by an authoritative interpretation of the principle which should govern such cases, but is actually left to be answered by each board of guardians for itself." (*Ibid.*)

246. Upon this, Mr. Stanhope proceeds to add his opinion that further inquiry is necessary:—

"All the evidence appears to me to lead to the conclusion that to ascertain the principle which ought to be recognized in such cases, and the most effective means of offering encouragement to the formation of sound clubs an inquiry is imperatively needed. And on the present question a no less important benefit would be conferred by a consideration of the condition of existing friendly societies. Rotten clubs are sheltering themselves under the protection of Mr. Tidd Pratt's certificate of registration, and availing themselves of the attraction with which this sham security invests them. But besides these certified clubs, it must be remembered that there is an enormous number utterly unrecognized by law, under no restrictions as to management, and whose financial condition is unknown. In the parishes in Kent, where I made special inquiry on the subject, I found the proportion of uncertified to certified societies to be as three to two. And there is a further question well deserving consideration, which is most ably advocated by the Rev. J. G. Stratton (Evid. 228), whether a system of friendly societies might not be organized through the agency of the Post Office, just as annuities and sums payable at death can now be secured by it. For all these purposes a more searching inquiry than was possible under my present instructions appears most desirable." (G. 207.)

247. Mr. Tidd Pratt, in his "Observations on Friendly Societies for Payments at "Death, commonly called Burial Societies" (1868), thus describes generally the objects which benefit societies should have in view, and the proper manner of attaining them:—

"The benefits for which the working classes should insure are,—

1. Medical attendance.
2. Payment in sickness until the age of 60 or 65.
3. An annuity, or old-age pay after 60 or 65.
4. A payment at death.

"The two last, viz., the old-age pay and payment at death, may be secured with the guarantee of the Government by insurances at the Post Office.

"With respect to medical attendance and sick pay, these benefits may be secured by local friendly societies legally established for those purposes." (pp. 7, 8.)

248. At a meeting of the central board of the Hampshire Friendly Society, held at Winchester on the 17th March 1869, Wyndham S. Portal, Esq., Vice-President in the chair, it was unanimously resolved,—

"That the establishment of good county friendly societies throughout the kingdom would be a great encouragement to industry and frugality, especially in small country parishes."

249. I have no doubt that further inquiry, as Mr. Stanhope suggests, would greatly contribute to that desirable object:—1. By bringing into full light, on competent authority, the present system and management of those most numerous existing societies which entail certain loss and disappointment. 2. By diffusing a knowledge of the principles and management of the few clubs which are in a sound and satisfactory state, and which consequently may be depended upon by the labouring poor to fulfil their obligations. 3. By aiding in the solution of the difficult problem adverted to by Mr. Stanhope, namely, "What is the best way of administering out-door relief so as to give "encouragement to provident habits."

Other questions mentioned in Reports of Assistant Commissioners which will

250. In addition to this question of friendly societies, there are many other topics of the highest interest included in the Reports of our Assistant Commissioners' disclosing defects and abuses connected with agricultural employments and arrangements, the remedies for which must be looked for more from an enlightened public opinion than from legislation. The bad results, both to the labourer and the employer, of the modes of hiring prevalent in the south as contrasted with those of North Northumberland, parts of Durham and Yorkshire, and a few other localities, where the

labourers, male and female, wanted on the farm are housed on or near the farm, and all are hired by the year, are widely exemplified in the Assistant Commissioners' Reports, especially in those of Mr. Culley, who has brought his experience as a landowner, and also as a practical agriculturist, to bear with great weight upon the subject. The practice of statute hiring has been exhibited as it exists both in its unimproved and its improved state in several districts. The very important question of the labourer's dietary has received much illustration showing that a low dietary necessarily produces inefficient labour (B. 8, 56–59; F. 10, 104), while the contrary gives that marked physical superiority which distinguishes the northern as compared with the southern labourers. (Appendix to 1st Report, Part 1, p. 158; J. 79, 98; j. p. 411–12; k. 123.) These subjects, together with the mode of lodging farm labourers in some districts, the comparative effects of small farms, both on the farmer and the labourer, and other matters of interest, will doubtless receive further illustration in the Reports of our Assistant Commissioners on Wales, our Report upon which will, we anticipate, be ready for presentation to Parliament at the commencement of the next Session, and also in the course of the inquiry in Scotland, which will immediately follow it.

be further illustrated in subsequent Reports.

All this I humbly certify to Your Majesty.

Given under my hand and seal this 22nd day of October 1869.

H. SEYMOUR TREMENHEERE.

2, Victoria Street, Westminster.

MR. TUFNELL'S SEPARATE REPORT.

TO THE QUEEN'S MOST EXCELLENT MAJESTY.

MAY IT PLEASE YOUR MAJESTY,

1. PREVIOUS to entering into the question as to how far the principle of the Factory Acts can be adopted for the regulation of the employment of children, young persons and women in agriculture, I think it desirable to lay down the rules that, in my opinion, ought to guide us in interfering with the means by which the labouring classes get their living. It seems to me a necessary preliminary to come to some decision on the difficult question as to what are the limits of the province of Government, and how far the *laissez faire*, or non-interference principle, ought to prevail. I may be permitted to quote on this point the words of Burke, who says in his "Thoughts on Scarcity":—

"It is one of the finest problems in legislation, and which has often engaged my thoughts "whilst I followed that profession,—what the State ought to take upon itself to direct "by the public wisdom, and what it ought to leave with as little interference as possible "to individual discretion."

Limits of the province of Government.

2. I think it necessary to make these prefatory remarks, because a very large proportion of the witnesses, who have been examined under this Commission, seem to have entirely forgotten the necessity of some consideration of the problem so clearly stated by Burke, and to have imagined that every evil they have observed among the agricultural population ought to be cured by the direct interference of Government.

Proposals to cure every evil among the agricultural population by direct Government interference.

3. Thus we are asked to prohibit girls from working in the fields up to the age of 13, that they should be allowed to work up to that age, but not afterwards; that they should be prohibited from working under the age of 16; that no female should be allowed to work in the fields at all; that she should be allowed to work, but always two hours less than a man; that girls should only be employed in summer; that they should not be employed at all, unless married; that no child be taken to work on foot beyond one mile; that no woman be employed on thrashing machines, or allowed to drive a cart; that no labour on Sunday be allowed; that the sexes shall never be permitted to work together, or more than 20 in a gang; that Government should build cottages for the poor.

4. Now, it appears to me that the above proposals, with some few exceptions which I shall presently define, wholly overstep the proper boundaries of legislation, and that

Proposals that wholly overstep the

proper boundaries of legislation.

the greatest confusion would result from any attempt to carry them out. I do not deny that they refer to serious evils that ought to be cured; but I deny that the cure is to be sought for by Acts of Parliament, and, further, I am of opinion that any attempt to cure them by direct legislation, would either result in passing laws that would be broken by general consent, and so bring the legislature into contempt, or superinduce other evils of greater magnitude.

Past legislation full of futile attempts to cure, by Acts of Parliament, evils that had been observed to affect labourers. Present legislation in respect of milliners injures those it was intended to benefit.

5. The history of past legislation is full of attempts to remedy evils that affected labourers, by methods that seem opposed to every principle of political economy and even of common sense. Wages of a carter and shepherd, by an Act of 1444, were ordered not to exceed 20*s.* in money and 4*s.* for clothing. By an Act passed in 1487, no one was allowed to take more than one farm, the value of which was not to exceed 10 marks yearly. An Act of 1562 empowered the magistrates to fix the rate of wages, and ordered that four acres of land should be allotted to every cottage, which was repealed in 1775, because it had the effect, which we should now predict to be inevitable, of restricting the number of cottages. I am not sure whether some of our modern Acts of Parliament, passed with the same benevolent motives as, doubtless, dictated the Acts above quoted, are not liable to the charge of injuring those they were intended to benefit. The law, forbidding milliners to work after 4 o'clock on Saturday, has, in some cases, made the classes, it was intended to benefit, worse off than they were before. When the hours fixed by law arrives for closing the workshops, the milliners and others must go home and toil, or the half day they lose is deducted from their wages. "I find," writes a mantle-maker of her work, "I cannot get it done, consequently I must take it "home and find light, and in winter fire, which I should save if it were not for the "law."[1]

Principles which it is justifiable by legal measures to enforce with respect to the employment of children.

6. The principle which, as it appears to me it is justifiable by legal measures to enforce, is that no child should be cruelly treated or mentally neglected, or to put the proposition in another form, that no child should be overworked or under-educated, and to these points my recommendations will be confined.

Mill's opinion on the limits of the province of Government.

7. In defence of this principle I must take leave to quote the opinion of Mill, who gives, in the last edition of his Political Economy, a chapter on the "Limits of the "Province of Government." He says:—

"Whatever it can be clearly seen that parents ought to do or forbear for the interest of children, the law is warranted, if it is able, in compelling to be done or forborne. It is right that children and young persons, not yet arrived at maturity, should be protected, so far as the eye and hand of the State can reach, from being overworked. Labouring for too many hours in the day, or on work beyond their strength, should not be permitted to them. Education also, the best which circumstances admit of their receiving, is not a thing which parents or relatives, from indifference, jealousy, or avarice, should have it in their power to withhold."[2]

Is the health of children injured by agricultural work?

8. Pursuing the inquiry on the above principle, the first point to discover is whether children are cruelly treated or their health injured by agricultural operations.

9. There is a small amount of evidence showing the hurtfulness of some species of agricultural work to children. Thus W. H. Vipan, Esq., M.R.C.S., says, "To expose "a boy 10 or 12 years of age, even for 12 hours a day, to the cutting easterly winds "that prevail in the eastern counties, in the months of March, April, and May, must "not only be detrimental to his physical growth, but is nearly sure to develop the seeds "of any disease that may be latent in his constitution." And Dr. Borham, of Halstead, considers that "eight hours a day is as long a time as any boy of 10 ought to be "employed. If kept longer on his legs, the cartilages of his joints become disorganized "and produce stunted growth, curvature of the spine, and often that scrofulous diathesis "prevails to such an extent among the English poor."[3]

10. But the greatly preponderating opinion among medical men goes to prove that the health of children is nowise impaired by field labour. Mr. Norman says on this point:—

"18. It is the almost unanimous opinion of all classes that the labour performed by women and children in the fields is not injurious to them. The evidence of Dr. Paley is peculiarly valuable upon this point. Dr. Paley has been physician to the hospital at Peterboro' for 26 years, where nearly 2,000 cases pass through his hands each year, chiefly from the agricultural districts. He gives it as his opinion that the diseases which attack the agricultural population most frequently are rheumatism, inflammation of the air tubes, and asthma (with bronchitis). A record has been kept at the hospital of the ages of all the patients who suffered from these diseases; and from a reference to the record (Evid. 14) it may be seen that the ages between 5 and 20 (which may be taken as the limits of the

[1] Pall Mall Gazette, May 31st, 1869.
[2] Principles of Political Economy, by J. S. Mill, book 5, c. 11.
[3] Fraser, p. 15.

ages within which children and young persons are employed in the fields) are particularly healthy. No doubt old men are subject to rheumatism (Evid. 47); but Dr. Paley gives it as his opinion that rheumatism occurring late in life cannot be said to be the result of exposure in early life when the patient has been healthy during the intervening years.

"As regards surgical cases, Dr. Walker (App. 15) says that a certain number of cases of accidents are brought into the hospital at Peterboro' every year; that horse accidents are not so frequent as accidents arising from machinery, and that the latter usually occur to children about the farmyard carelessly playing with machinery. On the whole he thinks that field labour is rather healthy than otherwise. Dr. Francis, of Northampton, writes to me as follows:—'My medical experience of the 'poor has been derived from my connexion with the Northampton Infirmary, to which I have been 'physician 13 years. Nearly 5,000 patients, derived mostly from within a radius of 20 miles, annually 'enter the infirmary either as out or in patients. Of these the majority are women and children, and 'among them only an insignificant number work in the fields. I cannot call to mind a single instance 'in which any physical injury can be said to have arisen from such labour. The experience of the 'senior surgeon of the infirmary, who has held office there upwards of 30 years, and of the house 'surgeon, who has known it during the last 6 years, is similar to my own on this point.' (See too Evid. 16)."[1]

11. James Palmer, Esq., surgeon, at Flaxton, Yorkshire, says:—"I do not think that "the health of the children is at all damaged by field work."[2] H. Veasy, Esq., medical officer of the Woburn Union, says, "In a physical point of view, early field labour "conduces to natural growth and general development, by expanding the chest, exer- "cising the muscles, bone, and ligament to their proper use; quickening all vital action "with free supply of its best support in pure air; inuring to hardness, and the compen- "satory blessings of ready digestion, and sound sleep by constant exposure and moderate "fatigue."[3] Mr. Boyle reports of Huntingdonshire, "With the exception of children "overworked in gangs under 10 years of age, it appears that field work is not only not "detrimental to the health, but is by some witnesses pronounced highly beneficial."[4] The Rev. J. W. Hayward, of Grandborough, Bucks, writes, "I wish to express a "decided opinion in favour of field work for the occasional employment of the young "of both sexes; I have never known any injury to arise from it to health or morals; "upon small farms, under the superintendence of the farmer or some trustworthy man, "the employment of young children with others of the same age, is to be preferred to "the common custom of the father of a family performing a piece of work which he "has taken, by the united labour of his family, inasmuch as the younger children are "sure to be strained to keep up with the elder."[5]

12. Dr. White, medical officer in the Woodstock Union, Oxfordshire, says, "There "is no reason to suppose that agricultural labour in this district is injurious to the "health of those engaged in it. . . . It is a rare event to find a sick child whose "illness can be ascribed to its being employed in field labour at too tender an age."[6]

13. W. Lightfoot, Esq., surgeon in the Wantage Union, Berkshire, writes, "I beg "to say, as far as my experience of 21 years goes, that a healthier set of women and "girls are seldom to be met with, which I consider owing to field work."[7]

14. Mr. Stanhope, alluding to the employment of girls in field work, says that the objections are in Lincolnshire:—

"First, that it is injurious to their physical health. Upon this point there is much difference of opinion. The cold and exposure inseparable from field work are said to produce rheumatism and consumption. Others say that it is particularly injurious to them just after the age of puberty. In the fens especially they are exposed to a great deal of wet, by being taken to weed corn or green crops in rainy weather. But Dr. Mackintosh, after 20 years' experience, says, 'Girls employed in the fields 'enjoy more robust health, and a greater immunity from the complaints incident to the age of puberty, 'than girls who are employed in in-door service.' (Evid. 25.) They are rarely put to winter work, and the more general opinion as to summer work is, that it is rather favourable to their physical health than otherwise."[8]

15. But as respects boys he concludes, "Whatever therefore may be the case with "reference to the necessity of requiring some better school attendance from boys, there "is no reason on the ground of health for fixing any limit before which they shall not "be allowed to work different from that of the Factory Acts."[9]

Are children cruelly treated?

16. As respects the question of cruelty to children, there is almost a total lack of proof that any cruelty exists. Mr. Stanhope, reporting on Nottinghamshire and the fens of Lincolnshire where, in a few instances, cases are mentioned of children going five or six miles to work, says:—

"101. Cases of injury to the children from going these long distances to work appear to be rare. The main sufferer is the farmer himself. Children, unless absolutely forced, will only do a certain

[9] Stanhope, Rep., p. 79.

amount of labour in the day, and the fatigue produced by going a long distance to work diminishes, if not their actual working hours, at any rate the amount of energy that they put into their employment. 'I have never observed,' says one witness, 'any signs of over-fatigue in children, though many 'of them walk two miles, or rather more, to work.' (Evid. 281.) The case is very different from that of men, who are called upon to exert their utmost strength at work. Young children are rarely put to any employment requiring the exertion of strength. Nimbleness and quickness of hand are the especial qualities required. With women it is rather different. Dragging turnips out of the ground and some similar employments do involve the use of force, but grown up women with their shorter hours of work are pretty nearly as well able to go long distance as men.

"102. But as to this and many other practices, the best test after all is that of experience. These children do not grow up to be unhealthy or deformed, or unfit for work; but, on the contrary, they become labourers who can compare in strength and working ability with any in England. And if this is the case, can it be expected that any absolute prohibitions as to distance would be rigidly enforced? If any regulation should be thought advisable, some simple rule forbidding all children from being taken to work *on foot* beyond a distance of two miles would appear to be the readiest mode of effecting the object with least interference to the labour of the children."[1]

No restriction on child labour required in Northumberland.

17. And Mr. Henley, in his Report on Northumberland, in answer to the question, "Are the females or the young subject to any ill-treatment;" writes, "The evidence "on this point is overwhelming; no ill-treatment is attempted and none would be "possible."[2] And he sums up his conclusions in the following pithy sentences:—

"210. I beg leave now to state shortly the views which I have been led to form on those points which are described in your instructions as 'the principal points of the general question.'

"211. Legislation is not required in Northumberland for the purpose of fixing the age below which boys and girls should not be employed in farm labour, as the parents never send their children out to work at an age which is physically and morally injurious. There is a general concurrence of opinion that no child should be employed before 10 years of age.

"212. There is no necessity for limiting the hours of work of boys or girls, &c., as in the words of Mr. Fife, the eminent surgeon in Newcastle,—'The duration of the hours of labour, depending as they do on the season of the year, the condition of the crops, and the state of the weather, must vary; but periods of great activity are usually followed by comparative rest; upon this subject any legislative enactment must be vexatious and obstructive.'

"213. It is not necessary to secure by legislation proper meal times for the young and females engaged in farm labour; the time allowed is ample.

"214. It is not necessary to limit by legislation the distance to which children should be taken to work, as no abuse exists.

"215. It is not necessary to provide by legislation that females should be protected from unhealthy or unsuitable employment in agriculture, as the medical testimony is conclusive as to the healthy nature of their employment, and there is no evidence that such employment is morally injurious. On the contrary, it tends to rear a fine race of women, who make the best wives for labourers, and are invaluable in a national point of view as producing and rearing a fine population.

"216. Mr. Thomas Lawson, of Longhirst, who attaches great value to the employment of women in field work, in answer to the question whether any restriction should be placed upon it, replies:—'Most certainly not; I would sooner recommend that every young female should, on physical and 'national grounds, be obliged to work a certain number of days for a certain number of years at field-'work of all classes.'"

Are children employed in agriculture under-educated?

18. Hence, it being established that children are not cruelly treated or overworked in agricultural employment, the next point to consider is whether they are under-educated, and on this question such abundant evidence has so frequently been laid before Parliament and the public to the effect that there is a great deficiency of education among the labouring classes, that it is almost superfluous to quote evidence in support of it. Therefore, I shall only refer to a few facts on this topic, though evidence leading to the same conclusion could be multiplied to any extent.

19. Mr. Fraser says:—

The maximum school age has been lessening.

"The maximum school age has been steadily and almost continuously lessening for the last 10 years. In agricultural districts it has become a rare thing to find a labourer's son in the schools above the age of 10. Many of the schools are filled with babies. When we compare the standard we have reached with that which seems to be attained without effort in Prussia, and assert in a triumphant tone that our 1 in 7·7 of the population at school is not so very far behind their 1 in 6·21, we ignore or find it convenient to keep out of sight the difference *qua* results implied in the fact that our school life is between 3 and 10, or at the best 3 and 12, while the Prussian school life is between 5 and 14." "He thought he was guilty of no exaggeration in saying that 50 per cent. of the adult agricultural labourers could not read or write. He had talked to several labourers he had met, and one could not read, another could not write, and almost every case he came across was unsatisfactory."[4]

20. The above is an extract from a speech delivered by Mr. Fraser at a large public meeting at Halstead, Essex, in which Dr. Borham said that 9 out of 12 could not sign their own declaration in clubs, and the following motion was agreed to:—"That it is the unanimous opinion of this meeting that the education of the agricultural labourer in this district is not satisfactory."

[2] Henley, Rep., p. 58.
[3] Henley, Rep., p. 70.
[4] Fraser, p. 18.
[5] App., p. 191.

21. The Rev. C. B. Wollaston, rector of Felpham, Sussex, writes:—

"I have already, as a school inspector, reported to our bishop to the effect that the employment of very young boys in the place of men, principally as horse boys, is having a most damaging effect upon our parish schools. The average age of the first class in our National schools has fallen 11 months in the last 10 years, mainly owing to the demand for boy labour."[1]

22. And Mr. Arkcoll, a magistrate at Hailsham, mentioned his surprise at finding so many young lads in his district unable to write. He had tested their ability in the case of the boys who had been sent to him for licences to remove cattle under the cattle plague restrictions. In one case, which he was led to inquire into, he discovered that out of a nominal school life of five years the boy had actually attended school less than one.[2]

Difference between the nominal and real school life of children.

23. This difference between the nominal and real school life is further shown by Mr. Beckett, of Ingoldisthorpe, a school inspector of Norwich, who furnished Mr. Fraser with some tables proving that the five years of nominal school life, when tested by the entries in the register, are constantly found to dwindle down to less than three, and those three not years of uninterrupted attendance, but distributed at intervals, growing more and more intermittent as the boy grows older, and every year becomes of higher value, over the five.[3]

Numbers of the agricultural class growing up without education.

24. Mr. Culley, after examining a mass of educational returns from Bedfordshire and Bucks, comes to the conclusion that—

"There can be no reasonable doubt that there are a great many young people of the agricultural labouring class growing up without sufficient education, meaning by sufficient education the power of reading and writing, and using for ordinary purposes the first four rules of arithmetic; and that not a few are growing up without any education whatever in both of the counties to which these returns apply."[4]

25. Mr. Norman, reporting on Northamptonshire, says:—

"24. In order to test the sufficiency of the education it was necessary for me to lay down some standard of what amount of education was sufficient. I usually stated that I considered the children of the agricultural poor sufficiently educated if they could read a newspaper with ease and fluency, write a letter, and understand a tradesman's bill. Judged by this standard, it was the opinion of five out of the six Boards of Guardians which I visited that the state of education was defective. (Evid. 1.) The only place where the Board of Guardians considered the education sufficient was Oundle; and I regret to say that even in this instance my personal inquiries led me to the conclusion that the opinion of the Board was not well founded. I also examined the roll of the Northampton Militia, and the result of my examination was to show that from the year 1860 to the present time between 39 and 49 per cent. of the recruits enlisted each year could neither read nor write."[5]

26. Mr. Stanhope, reporting on Nottinghamshire and Lincolnshire, says:—

"145. With respect to the larger villages, the evidence is almost unanimous as to the state of education among the young agricultural population. The Rev. Prebendary Perry, of Waddington, says:—'Taking the lowest standard of a sufficient education for an agricultural labourer, I believe that more 'than one-half of the population is growing up without it. There are probably very few who grow up 'without some knowledge of the above subjects.' (Evid. 86.)"

"At Langtoft, the Rev. J. S. Warren says of the candidates for confirmation, 'This year, out of 20 'boys that came to me averaging sixteen years old, seven could not read at all, and 10 could not write 'at all. With others the power was too small to be of any practical use. The girls were better. Out 'of 14, three could not read, and eight could not write.' (Evid. 250.)"

"At Long Sutton, 'Out of a night school averaging 40, only 15 can read thoroughly, write fairly, 'and work the compound rules.' (Evid. 166.)"

"146. The result of my own inquiries leads me to the same conclusion. Out of 180 children in Lincolnshire over 10, and actually engaged in field work on the day on which I examined them, 42 could not read or write, 36 could read only, 60 could read and write a little, while only 42 had received a really satisfactory education in these respects; but no less than 31 out of the 42 who were educated came from towns or large open villages. On one farm between Retford and Worksop, out of 15 lads between 12 and 16, four could neither read nor write (three of them coming from large towns), and two could read only; five were well educated. One employer at Deeping St. James says:—'I have '10 boys only; of these four cannot read or write. I asked them to-day, and I was much surprised, 'because I knew two of those who could not read to have been at school a great deal.' (Evid. 252.)"[6]

Modes by which the deficiency of education can be supplied.

27. The question that next comes in order is how best to supply this deficiency of education among the agricultural population.

28. In the circular that was distributed by the Assistant Commissioners opinions were asked on the three modes by which the prescribed amount of school attendance of children employed in trades and manufactures is obtained. These are, first, half-day at school and half-day at work; secondly, by alternate whole days at school and whole days at work; thirdly, by school attendance for a certain number of hours during the preceding six months.

The half-time or alternate day system.

29. As respects the half-day or alternate day system, the evidence is so strongly and almost unanimously against it, that I believe it would be utterly impossible to put in force any enactment having this object in view. On this point I will only quote the opinion of the Rev. John Wilkinson, a zealous educationist, who is his prize essay on the farming of Hampshire, published in the Journal of the Royal Agricultural Society, speaks of it as follows, and his conclusions are sanctioned by an overwhelming weight of evidence :—

"A half-day system will not answer, because the boy has a whole day's work set him, and that very possibly at a distance from home ; alternate days will not answer, because every workman's usefulness depends on his acquaintance with his work, and if he be away half his time he is just twice as long learning his business ; neither will master, bailiff, or headman be bothered with teaching two sets of boys ; they say one is trouble enough. Besides, where are the relays to come from ? At pressing times every boy and girl is wanted ; and even for constant places, in parishes of ordinary density of population, the supply of boys is not beyond the demand. There is no juvenile reserve. The application of these schemes to an agricultural district is an impracticable theory. They proceed on a mistaken analogy between manufacturing and agricultural operations. In the one there is concentration of uniform work, under cover, in one spot, independent of season and weather ; in the other the work is spread over some square miles, is exposed to wet above and mud below, varies with every season, and is dependent on every atmospheric change. From circumstances so different the same practical conclusion cannot be deduced."

Instances in which the half-time system has succeeded.

30. It is true that there are a few instances on record in which gentlemen farmers have tried a half-time system with apparent success. Lord Rayleigh, in Essex, tried it for 10 years on a considerable scale, and it is thus described in Mr. Fraser's Report :—

"*Lord Rayleigh*, of Terling Place, Essex, used to have a gang of boys between the ages of 10 and 12, varying in number according to circumstances from 10 to 40, whom he employed upon the half-day principle. He paid them at the rate of 3*d.* a day for the first year, and 4*d.* a day for the second year. He did not advance beyond 4*d.* a day, because he did not wish to interfere with the farmers' labour-supply. He was induced to form the gang, which was placed under the superintendence of an old experienced workman (who got an extra shilling a week for the duty), in consequence of seeing such a number of idle boys about the village. A condition of employment was that the boys went to school. They attended school every day from 9 to 12 ; then had their dinner and assembled in the playground ; were then marched, under their old commander, from the playground to the scene of their work, and were employed from 1 o'clock to the ordinary leaving-off time. The experiment was continued for about 10 years, and in Lord Rayleigh's opinion worked successfully. The school never was so full of boys, and the master said that the half-timers learnt as much in three hours as they used to do in five. The plan, however, has been discontinued about four years, in consequence of the supply of boys in the parish falling short."[1]

Half-time as practised by Sir P. Grey Egerton.

31. Sir P. Grey Egerton also tried it in Cheshire, and it is thus described by him in a letter to the Commissioners :—

"In reply to your communication received this morning with reference to the conversation I had with Mr. Tufnell, on the subject of the half-time system, I beg to say that I have tried it on a very small scale, but have found it answer admirably. Finding the boys leaving my school as soon as they could get employment with the farmers, viz., at about 12 years of age, I arranged to take six of them on to the farm and garden for half days at sixpence each, this being about the equivalent of what they would earn from a farmer for the whole day. They are divided into two gangs. One goes to school in the morning and to work after dinner, the other goes to work in the morning and to school in the evening. This arrangement continues for one week, and the next week they change places. I find the system very popular and the result is what I chiefly desired, namely, having the control over them till they are 14 years of age. They thus get a certain amount of schooling, and are also learning the trade they will follow in after life. The work they do is I think equivalent to the wages I pay them, and if they go into service they get higher wages than if they were ignorant of field work. I am about to take one boy into the stables on the same plan, and probably one into the house. I have now had three or four year's experience of the system, and find the results so satisfactory that I should be glad to see it tried on a larger scale."[2]

The experiment of Mr. Paget in Nottinghamshire.

Failure of the half-time system.

32. The experiment by Mr. Paget in Nottinghamshire is widely known, and is described by him in a letter to Mr. Stanhope, but in every case, the plan seems to have been tried in exceptionally favourable circumstances.[3] A large landowner can carry out any favourite scheme, that would be utterly unsuited to the ordinary conditions under which the tenant farmer occupies his land. In many parts of the country, as is shown in the evidence, the agricultural population is not equal to the demand for it, and every boy, who is capable of working, is employed. How then could a system work that requires a double number of boys ? Mr. Fraser rightly observes, "What Mr. Paget can do with "eight boys at Ruddington in a population of 2,300, it might be found impossible to do "even there, if every farmer in the parish attempted the same thing ; it would certainly "be found impossible in the thinly peopled parishes of the south of England, where "boy labour is in great demand, and there is asserted to be no redundancy of the "article."[4] Lord Rayleigh's experiment was considered by the neighbouring farmers a

[1] App., p. 192. [2] App., p. 147. [3] App., p. 148. [4] Fraser, p. 28.

failure, and has been given up for four years, as Lord Rayleigh asserts "in consequence "of the supply of boys in the parish falling short."

Success of the half-time system in pauper schools.

33. I am personally extremely favourable to the half-time system, and perhaps have had more opportunities of witnessing its success in a particular line than any other person. It is enforced by order of the Poor Law Board in every pauper school, and I am well acquainted by actual inspection with its working in every pauper school in Middlesex, Kent, Sussex, Surrey, Hampshire, and Berkshire. Nothing can be more successful. The children, though only occupied half as long in book work, as those in village schools, learn far more. Mr. Fraser, in his Report to the Newcastle Commission, speaks of them thus:—

"It struck me that the condition of the workhouse schools very nearly approached the ideal of what elementary education in this country ought to be; perfectly in keeping with what the children's future career is likely to be."

34. This opinion is confirmed by the Rev. Thos. Headly in his Report to the same Commission, where he says:—

"The boys, though spending only half the day in the school, made excellent progress. Indeed of all the schools I examined the workhouse schools seemed to me much the best."

35. The real secret of their success is that they are boarding schools, the attendance is consequently strictly compulsory, and regularity of attendance, the absence of which is the supreme difficulty that has to be encountered in all day schools, is enforced without a murmur. None of these conditions apply to the education of independent children.[1]

Half-time system as enforced by Parliament in factories of doubtful educational value.

36. There is, however, considerable doubt, whether the half-time system, when made obligatory by Act of Parliament, and not enforced by the wishes of the parents, is of much educational value. The number of half-timers in the inspected schools is surprisingly small, and the Vice-President of the Committee of Council on Education, in moving the supplies for the Education vote on 19th July,[2] remarked "He had been "surprised to find that the half-timers, who were obliged by law to remain at school till "13 years of age, made so little difference (in the number of children over 10), and he "believed, that in debates upon the subject, there must have been a tendency to exaggerate the effect of legislation, for not more than 55,000 half-timers altogether were to "be found in the Government school."[3] It is asserted in the Report of the Commissioners on Endowed Schools, that the prospect of a free admission to an endowed school, induces the parents to neglect the education of their children till the time of admission arrives. This effect has been observed in the Greenwich Hospital Schools, where boys were only admitted at 9 years of age, and of which the Rev. Canon Moseley reported in 1850:—

"Some of the boys when asked why their parents had neglected to send them to school before, answered that they saw no use in it, because they knew they would have plenty of schooling at Greenwich. Their parents were accustomed to consider it unnecessary that they should be taught anything before they went to Greenwich, because they would be taught so well afterwards."[4]

37. Mr. Fraser says on this point:—

"The unfavourable influence is, that parents knowing that they will be obliged to send their children to school as soon as they begin to earn wages till they attain the age of 13, often let them run wild in the streets till the wage-earning period arrives."

---

[1] I, however, must not be supposed as assenting to the opinion given by Messrs. Fraser and Headly as to the excellence of the education given in workhouse schools. The education given in these schools, if regarded only in its intellectual aspect, is doubtless excellent. But boarding schools for the lower classes require something more than intellectual education to fit the children for the business of life. The schools so praised by Messrs. Fraser and Headly may have been very bad ones, as the children may have been morally bad by contact with adult paupers, and not able to turn their hands to hard work from the want of industrial training. These two defects—the absence of moral and industrial training,—do not come under the cognizance of an inspector of village day schools, but they are well known to persons who, like myself, have had experience of pauper education, as the source of deadly evils in many workhouse schools.

[2] "Times," July 20.

[3] In Glasgow the half-time system seems wholly to have failed, according to the Second Report of the Scotch Commissioners of Education, p. 135, where they say:—"'The half-time system proper is almost wholly 'ignored in Glasgow.' It appears that there is only one manufactory in Bridgeton where the system is tried. But the evidence shows that the school to which the children go is quite inefficient. 'The master, an elderly 'man, was not trained as a teacher. He betook himself to the work more from necessity than choice, and 'considers himself sufficiently remunerated with 12*s.* a week for teaching some sixty factory children.' Messrs. Harvey and Greig declare that the mill-owners are opposed to the system as 'vexatious,' and would rather employ no children under thirteen than have half-timers. Again, the manufacturers insist that 'after 'they have submitted to the drudgery of its operation, the children leave for other occupations.' In Glasgow it seems that there are large works which are not within the Factory Acts, and where children are employed without any restriction as to age, hours of work, or education. The result is, that the children leave the works which are regulated by law, and betake themselves to those which are free from legal restrictions."

[4] Report on Greenwich Schools, 1850.

38. Mr. Assistant Commissioner Winder says :—

"I satisfied myself by repeated questions to individual children, and by an inspection of school registers, both at Rochdale and Bradford, that on the average, half-time children at the commencement of their work have been a shorter time previously at school than day scholars of the same age. I am afraid that it is the prospect of compulsory education, that is at the bottom of this exceptional neglect, and this I found to be the opinion of those best qualified to judge. The knowledge that a child must go to school at a later period of life makes its parents more careless during its earlier years." Canon Girdlestone also, speaking from an experience of 25 years in Lancashire, states that great numbers of children do not attend school, till the age arrives at which they are compelled by the Factory Act to do so."[1]

Undesigned evil effect of the compulsory half-time system.

39. This undesigned effect of the compulsory half-time system is further established in the last Report of the Committee of Council on Education, where the Rev. G. Steele, Government Inspector in Lancashire, says :—

"It is a very common practice for parents in manufacturing districts, altogether to neglect the education of their children until they commence work, *i.e.*, until they are eight years old at least. The idea is, that when they are compelled to go to school they will get schooling enough. It results, that if a child does not happen to get work at a factory, it has no education at all ; if he does, his whole time is taken up in mastering rudiments, which ought to have been acquired long before ; and he never probably acquires enough to be of real service. The first standard in factory schools is constantly filled with great boys and girls whose work and schooling recently commenced together. Thus a sort of encouragement is indirectly and undesignedly given to parental negligence ; for probably many of these children, but for the prospect of future enforced education, would have been sent in school in earlier years."[2]

Effects of such a system in encouraging parental negligence.

40. Mr. Stokes also, the Roman Catholic Inspector in the north-west of England, reports to exactly the same effect. He says :—

"Upon parents of careless habits, the prospect that at 8 years of age their children will be sent to school as half-timers without fee from them, produces the very same effect as the hope of free admission to an endowed school in the class above them. In both classes, parents shirk the duty of paying fees for the early education of their children, and await the time when schooling will come without a drain upon their pocket. In the labouring class, with which I am concerned, this delay is ruinous. In too many cases, children brought up in the streets, their only playground, have at 8 years of age acquired habits, which, added to their ignorance of the elements of learning, and to the exhausting nature of their work, obstruct the educating influence of the primary school."[3]

Method of enforcing education by the Printworks Act wholly nugatory.

41. The third method of enforcing the school attendance of children is that prescribed by the Printworks Act (8 & 9 Vict. c. 29, 10 & 11 Vict. c. 70), which enacts that every child under 13 shall attend school for 150 hours distributed over 30 days, in each half-year, during any part of which it is employed in a printwork ; no attendance beyond five hours in any one day being reckoned as part of the 150 hours.

Mr. Horner's opinion on the Printworks as respects education.

42. I believe this plan to be entirely in-operative. The Newcastle Commission reported strongly against it, and the late Mr. Leonard Horner, a factory inspector for 25 years, denounced it in the following strong expressions : "Of all the mockeries of "education, which the Legislature intended that children employed in factories and "printworks should receive, by the enactments for that end, none is so great as in the "case of a large proportion of the children employed in printworks."[4]

43. This criticism is confirmed by the Rev. D. V. Hadley, Her Majesty's Inspector of Schools in Lancashire, who says in his report of 1866 :—"I must record my convic-"tion that the provision made by the educational clauses of the Printworks Act are "little better than useless. The children employed in these works are the worst educated, "as a class, of any in my district."[5] And in the report of Mr. White, the commissioner appointed to enquire into the operation of the Printworks Act, published last June, Mr. M'Adam, the manager of a large printwork, says :—"I do not consider the educational "part of this Act worth anything."[6]

Employers of children willing that all children should be prohibited from working up to the age of 10.

44. But in conjunction with the absolute prohibition of all children from working under a certain age, many of the witnesses propose some approach to the system of the Printworks Act, and it may be useful to mention some of them. Mr. Fraser says,—

"It is the almost unanimous opinion of every person and body of persons who have expressed opinions upon the subject, that the best mode of promoting the education of children in agricultural districts would be (1) to prohibit their employment on the land under the age of 10 ; (2), to make provisions for securing their regular attendance at school for the five years preceding that age; and in several cases the suggestion was added that (3) to prevent the possible loss, by disuse, of what they had attained, the children, when emancipated from entire restriction, should still be required to fulfil a certain amount of winter attendance—say 150 hours—either at day or night school, for two years more.

---

[1] Fraser, p. 26.
[2] Report of Committee of Council on Education, p. 228.
[3] Report of Committee of Council on Education, p. 318.
[4] Newcastle Commission Report, p. 211.
[5] Report of Committee of Council on Education, 1866, p. 106.
[6] Report on Printworks Act, p. 48.

I should add that not only do farmers think that this mode of dealing with the subject would be the mode least embarrassing to them in the cultivation of their land; but that managers and teachers of schools declare that they could do more for the children's education in this way than they could hope to do if regular attendance ceased at 8, and intermittent attendance took its place till 13. My own opinion, formed upon an experience of 20 years as manager and (to a considerable extent) teacher of a rural school, entirely coincides with theirs."[1]

45. Mr. Stanhope gives the following schemes from Nottinghamshire:— Proposed schemes for educating agricultural children.

"168. The plan suggested by Mr. Paget as calculated to meet the requirements of agriculture in his neighbourhood is to hold a test examination in reading at 9 years of age, and from that till 13, to require 90 days' school attendance in each year. Eight of these days are to be in each of nine months, and the remainder at any time that suits the convenience of the farmer. (Evid. 276.)

"169. A somewhat more elastic scheme is suggested by the Rev. J. M. Lakin as applicable to Leicestershire, namely, that the attendance should be all completed during three summer months and three winter months, leaving the other half-year free. (Evid. 326.) That the attendance should be permitted to be made at any time during the year is proposed by several witnesses. Thus the Rev. J. S. Warren says:—'I do not see that any inconvenience would arise from a child being obliged, before 'employment in labour, to produce a certificate that he has made a certain number of attendances at 'some school during the 12 months last past. This would enable employers to avail themselves of 'child labour when most required, and would allow parents to select the times of year and the kinds of 'employment best suited to their children's health and power.' (Evid. 250.)"[2]

46. Another elaborate plan is proposed by the Rev. E. Willes, Secretary to the Diocesan Board of Education in Leicestershire:—

"I. No child shall be employed in agricultural labour till he reach the age of 9 years.

"II. No child shall be employed in such labour between the ages of 9 and 13 unless he,

"*a*, have a certificate of having passed Her Majesty's inspector in the fourth standard at least.

"Such certificate to be renewed each year.

"Or, *b*, have attended school 100 days, or 200 times, or 500 hours in the preceding year.

"1. A school term to consist of not more than three consecutive hours, or (in the case of night schools) less than 1½ hours.

"2. Attendance at the night school to count as school 'time,' but not in addition to two previous attendances on the same day.

"III. In case Her Majesty's inspector do not visit any particular parish, children may be sent for examination to another parish.

"330. In a letter accompanying the preceding, and dated March 4, 1868, Mr. Willes says:—'This 'plan has, I find, commended itself to a number of farmers. I urge for them that no two counties, 'parishes, or even farms stand in precisely the same position as regards the demand for children's 'labour; that they ought not to be fixed rigidly to any given months or even days; that if the 'children have the inducement to learn afforded by the prospect of being free after 9 years of age, 'conditional on passing the Government inspector, and passing him every year (thus sending them to 'to night school to keep up their learning), a great number will be free at 10, if not at 9, that all 'classes in a parish will have a direct object in keeping up the efficiency of the elementary schools, and 'also of the regularity of attendance of all children under 9, as well as in forwarding those over 9 'who have not yet passed the inspector.'

"*Explanations.*—The renewal of the certificate from year to year would secure the attendance of the boy at a night school, to keep up to the standard; otherwise he would soon lose what he had learnt."[3]

47. Mr. Portman, writing from Yorkshire, says,—

"77. The most feasible plan for obtaining continuous education appears to be to fix an age below which no child shall go to work for hire, with or without compulsory attendance at school, to require a certain amount of school attendance from that age to 13 or 14 years of age, and perhaps, in addition, the production of a certificate of such school attendance before hiring. Very few objections will be found to this plan, with the exception of the certificate, but I think that when a good system of registering, which might be combined with a register for farm servants, is once established, the supposed difficulties and inconveniences will soon vanish.

"78. The evidence I think fairly justifies me in saying that of the three modes of securing school attendance proposed in your circular one founded on the model of the Printworks Act, modified and made 'elastic' enough to meet the necessities and vicissitudes of agricultural operations, would be found most practicable and most acceptable to the employer and the employed."[4]

48. Mr. Norman, writing from Northamptonshire, says,—

"The Rev. A. J. Empson proposed that all boys over 8 and up to 13 years of age should be compelled to attend an evening school at least 40 nights a year, and produce a certificate of such attendance every spring before they are allowed to be employed the ensuing year."[5]

49. Mr. Culley gives the following evidence from Bedfordshire and Buckinghamshire:—

"54. Archdeacon Bickersteth, in his answer to Question III. 26, expresses the view of most of the clergy, where he says:—'I doubt much whether either of the plans 1 or 2 (the half-day and alternate 'day modes would answer in agricultural districts. The principal of the Printworks Act (plan 3) 'might, I think, be applied with advantage with some modifications, such as the substitution of 12 'months for six;' *i. e.*, that as he had in answer to an earlier question recommended a total prohibi-

[1] Fraser, p. 29. [2] Stanhope, p. 89. [3] App., p. 327. [4] Portman, p. 102. [5] Norman, p. 116.

tion up to 10 years, he thinks that for children between 10 and 13 it would be most convenient to demand a certain number of hours attendance at school during the preceding 12 months, thus allowing the parents to choose the time of year when work is slack, probably the winter months, in which to se d their children who are between 10 and 13 years of age to school.

" 55. The Woburn Bench of Magistrates say:—' If the Factory Acts' principles are to be applied ' to children employed in farm labour, we think that school attendance for four winter month would be ' much better suited to such employment than either a half-day or alternate day system.' (See Beds evidence, 53.)

" 56. The Bedford Bench of Magistrates, after recommending 9 as the age under which children should not be permitted to be employed for agricultural purposes, say:—' Of the Factory Acts' modes of ' interference with children actually at work we think the 3rd, or Printworks' Act plan, of demanding a ' certain number of hours of school attendance during the preceding six months, most applicable to ' farm labour, substituting 12 for 6 months.' (See Beds evidence, 54.)

" 57. The Luton Bench, after recommending 10 as the age under which children should not be employed, express an opinion similar to that of the Bedford Bench in favour of the Printworks Act mode of interference substituting 12 for 6 months, provided that any interference after 10 years of age is deemed necessary. (See Beds evidence, 55.)"[1]

None of the above schemes feasible, except that which relate to the age of children.

50. I have thought it right to enumerate the above proposals for solving the important problem, how to educate agricultural children, and the evidence supplies many more schemes, but it is my decided opinion, for which I shall give my reasons subsequently, that none of them are feasible at present, except that which relates to the age, below which no child should be allowed to work.

51. It will be observed that the majority incline to the opinion that 10 is the lowest age which a child should attain before it is permitted to be employed, and as this point is so extremely important I will adduce more authorities in favour of a restriction up to that age.

The North Riding Chamber of Agriculture, farmers, and several Boards of Guardians think that children ought not to be employed under 10 years of age.

52. The North Riding Chamber of Agriculture resolved that "no child ought to be " sent out to work under the age of 10 years, harvest time excepted." Mr. Lomas, a large farmer near Thirsk, says,—" Very few boys are engaged below the age of 13. It " would not interfere with the convenience of the farmers to limit the age of boys for " work in the field to 12 years, excepting at harvest."[2]

53. Mr. Booth, a farmer at Warlaby, North Riding, says,—" Placing the limit for " children's work at 10 would hardly affect this district." Mr. Conway, a farmer in Bucks, says,—" Children are of no use to us in this neighbourhood under 10."[3] Mr. Carter, secretary to the South Bucks Friendly Society, says,—" It would be very little " hardship to the parents to compel school attendance up to 10 years of age." Mr. Treacher, a landowner in Bucks, says,—" I think that a boy beginning at 13 labours " under no disadvantages compared with a boy beginning at 10, except what may be " got over in a few weeks."[4] Sir H. Verney says,—" If it were decided to fix an age " below which boys should not be allowed to be employed in farm work, I would suggest " 10 years; but that would bear hard on a large young family, when a boy of 9 might " earn 2*s.* or 2*s.* 6*d.* a week by bird-keeping."[5] The Boards of Guardians of the Woodstock Union, the Witney Union, and the Henley Union, all passed resolutions to the effect that children should not be employed under 10 years of age.[6] The Bishop of Oxford says,—" I think that if the Factory Act principle is to be applied to farm labour, " a child should be allowed to work half-time at 8, whole time at 9, if it can pro- " duce a certificate that it can read and write well, and whole time at 10 under any " circumstances."[7]

54. Mr. Norman reports from Northamptonshire:—

" 31. It is very important to ascertain up to what age children could be spared from field labour. First, as to the requirements of farmers; it appears that in the 19 parishes (mentioned above), with a population of 8,975, 8 boys under 8, 80 between 8 and 10, and 10 girls between 8 and 10, are employed in field work (Evid. 5). The principal employment of young boys is scaring birds; but it is the opinion of some gentlemen well acquainted with agriculture, that this operation can be more economically performed by other agencies, as by a big boy who, if supplied with a hoe, could always employ himself advantageously, or by a man with a gun (Evid. 20, 21, 37, 71, 177). Weeding can be done more effectively and possibly more economically by men than by children (Evid. 67). Some farmers think that children might be spared until the age of 12 (Evid. 21 and 35); others, and probably the majority, think they could be spared up to the age of 10; this was the age fixed upon by the Northampton Chamber of Agriculture (Evid. 4); while the ages fixed by the Boards of Guardians were 10, 9, and at Towcester 8 and in winter 9 (Evid. 1). The restriction of labour up to the age of 10 could hardly, I think, involve any serious additional expenditure on the farmers; as pointed out to me by one farmer, ' at the worst it would only cost a farmer 6*d.* a week more to get a boy over 10 to do ' the work now done by a boy under 10,' and I don't think that this additional expenditure can be considered as serious, especially as it would necessarily purchase more efficient labour."[8]

[1] Culley, p. 130. [2] App., pp. 408, 419. [3] App., pp. 420, 528. [4] App., pp. 533, 537. [5] App., p. 543. [6] Oxford Evidence, pp. 356, 357. [7] Oxford Evidence, p. 360. [8] Norman, p. 114.

Mr. Norman's final conclusion is,—"Upon the whole it seems that the labour of children "may fairly be dispensed with up to the age of 10 years, without interfering too much "with the demands of the farmer on the one hand, or with the earnings of the family on "the other; and I think it desirable that the labour of children under 10 years of age "should be prohibited by law, except during the regular school holidays."[1]

55. Mr. Hughes, who has farmed in Norfolk, the Isle of Wight, and Northamptonshire, and now occupies 800 acres in the latter country, writes,— Children ought not to be employed under 12.

"From my own observation, and from evidence taken from the most reliable sources, I believe that, be the necessities of the family what they may, or the demand for labourers ever so great, that there is in the end, or in fact, no real economy in employing boys in farm work under 12 years; they eat more, wear more, tear more, learn nothing, and earn next to nothing. Take for instance the case of 'scaring;' a lad paid 1*s.* a day, with a gun at 3*d.*, will keep the birds off a large farm as effectually as possible, whereas two little boys at 6*d.* a day would certainly do no such thing; after the age of 12 the boy will walk to his work as far as the man can or ought to walk, say one mile."[2]

56. Mr. Stanhope, writing from Lincolnshire, says,—

"Farmers are almost universally anxious that boys at any rate should be free for field work at 10, if not at 9 years of age. One witness expresses their feeling clearly. 'After 10 it would not be 'desirable to compel attendance, for when once a boy has commenced farm work the employment is 'pretty constant, and unless his whole time were given to it the feeling would be strong that he can 'never become a good farm servant.' (Evid. 9.) When pressed with the objection that this does not meet one of the principal defects in the present system, namely, that boys are leaving school too early, a variety of expedients are suggested. Some propose compulsory attendance at a night school. The Lincolnshire Chamber of Agriculture proposes that a certificate of attendance from 7 to 9 years of age should be required, and that no restrictions should be put upon children after that age. (Evid. 1.) More commonly the simple prohibition from field labour up to 9 or 10 is thought sufficient. (Evid. 325.) 'They would then have time to obtain sufficient instruction to suit their circumstances in life.' (Evid. 63, 81.) But one of these witnesses adds, 'Before 10, with nothing but memory to rub at, and 'no reason,' a boy forgets all he learns in a few weeks."

57. In Norfolk:— The Earl of Leicester would prohibit the employment of boys under the age of 10.

"1. *The Earl of Leicester* would prohibit the employment of boys in field-labour under the age of 10. His bailiff, who began life as a working man, thinks no boy ought to go out to work before that age, and that, except in the case of very large young families, parents, at the present rate of wages, ought to be able to maintain them. At 10, boys ought to go to work; and he would not interfere restrictively with their labour, when they have once commenced work. He has a private gang of boys, ten or a dozen in number, under the superintendence of a steady labourer, who are employed all the summer 'stubbing' thistles in the park. Some of them are under 10, and earn only 4*d.* a day, which he is sure can't pay the parents for the extra wear and tear of clothes and shoes, and consumption of vituals, while the boys themselves suffer educationally and physically. He would rather not employ them, and would be glad to be relieved from the solicitation of the parents by a prohibition on their employment."[4]

58. In Northumberland, Mr. Henley reports that children seldom, if ever, go to work in the Glendale Union before 11 or 12 years of age, and then merely for summer work.[5]

59. It is clear from the above extracts that, from the employers' point of view, there would be no difficulty in prohibiting all field work to children who had not attained the age of 10. But it is important to discover what the labouring classes themselves would think of such a prohibition.

60. On this point Mr. Fraser, judging from the evidence collected by him in the counties of Essex, Norfolk, Sussex, and Gloucester, says, "The almost unanimous opinion of the "labouring men whom I have questioned on the subject is, that there is no need for a "boy to turn his hand to farm work till he is 12 or 13 years of age, if only his parents "can afford to keep him at school and dispense with his earnings."[6] *A fortiori* they would make little or no objection if the prohibition did not extend beyond the age of 10. Henry White, a labourer at Starston, who earns 12*s.* a week, and has had 12 children, says, "He is sure there is no profit in a boy's earning 1*s.* 6*d.* a week; it does not pay "for the clothes he tears."[7] Robert Webb, a farm labourer at Ingoldesthorp, Norfolk, the father of nine children, says, "He kept his youngest son at school till he was 13. "As far as making a good labourer goes, it's quite time enough for a boy to go to work "at 12, but perhaps 10 is a better age."[8] Elizabeth Green, whose husband earns 13*s.* a week, and has had 12 children, "has kept her boys at school till they were 10, 11, and "12. Children that go to work wear out more shoes and clothes, and they eat a lot "more food, and there isn't much gain in their earnings." Mrs. Wicks, in the Swaffham Union, who has brought up six children, and whose husband earns 12*s.* a week, says, "Boys ought to be kept to school till 10. Knows there is no gain in their earning Labourers mostly concur in the opinion that 10 is quite early enough to send children to work.

[1] Norman, p. 121. [3] Stanhope, p. 90. [5] Henley, p. 54. [7] App., p. 197.
[2] App., p. 432. [4] App., p. 165. [6] Fraser, p. 13. [8] App., p. 199.

" 1*s.* 6*d.* or 2*s.* a week; it is a loss; their shoes cost more, and so do their victuals." Ann Jackson, wife of a labourer at Sudborough, Northamptonshire, who has had four sons, says, " Some of them went to work at 8, and all before 10. They earned 2*s.* or " 2*s.* 6*d.* at first. If I was going to have my time over again I would not send them so " young to work. I think it is money in pocket for a parent to keep small boys at " home; it costs so much to keep them at work. They ought not to go to work until " they are 10 at least. I think it ruins children to go to work too young; they don't " grow as they should." [2] Mrs. Griffin, a labourer's wife, with four children, says, " Most boys under 10 would never be able to earn more than 40*s.* a year. If my son " earned only 40*s.* a year I would send him to school regularly, and sacrifice his wages. " If he were to get a good education he might get on the railway, or get a foreman's " place, or some work other than that of a farm labourer. I think no boy ought to " go to work until he is 10 years old, or can read and write. I think it costs 20*s.* a " year more to keep a boy when he goes to work than when he goes to school." [3]

61. The following is a striking remark by Mr. Portman, (paragraph 65, 2nd Report):— " I give one piece of evidence taken from the lips of a girl, Sarah Roe, 11 years old, in " Chevithorne school, near Tiverton. ' I went out stone-picking with mother at 8 years " ' old. I was out a month, and earned 6*s.* I wore out a pair of *new* boots in the time; " ' they cost 6*s.* 6*d.*' "

62. Mr. Norman, writing from Northamptonshire, says,—

"I found great difficulty in getting any precise information from the labourers as to the advantage they derived from the labour of their children. Few labouring men can say exactly how long any one of their children has been at work in any given year, or how much he or she has earned. However, I learned from one witness (App. 90) that children between the ages of 8 and 10 years are employed from 10 to 12 weeks a year and earn 2*s.* a week; another says that no child under 9 earns more than 15*s.* a year (App. 25); another, ' that most boys under 10 would never be able to earn more than 40*s.* ' a year.' (App. 162.) However this may be, all are agreed that a boy has to be far better fed when at work than when at school; thus, one woman told me that it cost her 20*s.* a year more to keep a boy when he went to work than when he went to school (App. 162); another says that it costs 1*s.* a week more (App. 53); another that she saved 6*d.* a week out of her boy's wages of 2*s.* a week (App. 42).

"Upon this point the Rev. W. Clarkson writes, 'It is thought by some well competent to judge ' that the children's working in the fields does not really make a difference of 1*s.* in their week's ' expenses, for the reason that though they want and ought to have a shilling'sworth more food, they ' do not in fact get it; it is not given them by their parents.'

"I doubt whether the children are usually insufficiently fed when at work. If this were the case, I think the fact must have been noticed by medical men. Then the additional outlay for clothes must be added in the estimate of the expenditure of a poor man's family, the clothes of the father who was an invalid are put at 1*l.* per annum, and those of a boy of 15 who was at work at 4*l.* (App. 12). It is quite clear, therefore, that the net gain arising from a boy's labour up to the age of 10 must be exceedingly small." [4]

Lord Sidney Godolphin Osborne would prohibit boys working under 10 and girls under 16.

63. The Rev. Lord Sidney Godolphin Osborne says:—" In my opinion no male child " should go to farm work before the age of 10 years; it would be more wise to make " the age 11;" and he subsequently adds, that no female under 16 years should be allowed by law to work regularly at out-door farm work. App., 2nd Report, p. 1.

64. The Reports of the Assistant Commissioners contain some evidence apparently showing that the labour of very young children is of importance towards the support of a labourer's family. But the almost universal testimony of employers that children under 10 may be readily dispensed with in farm work is a pretty plain proof that there can be little profit on either side in employing them. Labourers are bad calculators; and it is not surprising that many of them imagine that any addition, however small, to the earnings of the family, is of importance; not observing, that outgoings in clothes or food often exceed the value of the child's labour. The 1*s.* or 1*s.* 6*d.* weekly received is a tangible advantage, while the cost of the additional loaf or clothing passes unobserved amidst the general expenses of the family. The most intelligent labourers, and, what is perhaps more reliable evidence, the wives of the labourers, have stated (see above) that there is no profit in putting their children to farm work before the age of 10. Hence I think that the fair conclusion from the above evidence would be that neither employers nor employed would have any material objection to the prohibition of all labour to children under 10 years of age; but before we come to this decision there are some other points which it is necessary to discuss.

System of indirect compulsory education by requiring a certificate

65. It will be remarked that the evidence contains frequent recommendations of a system of indirect compulsory education, by which a certain amount of schooling is made a condition of employment for hire up to a certain age. This principle has been put forward in the strongest way by the Rev. Canon Norris, who brings to the subject the experience of 15 years as a Government inspector of schools, and whose words I will

[1] App., p. 203. [2] App., p. 441. [3] App., p. 457. [4] Norman, p. 115.

quote from some able essays lately published by him, entitled "The Education of the "People." He says:—

that the child has passed the fourth standard before it is allowed to work.

"I see no reasonable objection to a law requiring that no boys or girls under 15 years should be hired for farm service of any kind, unless they could produce certificates, signed by a teacher and countersigned by a Government inspector, that they had passed an examination in the fourth standard of the Revised Code. . . . The school attendance requisite to enable a child to pass in the fourth standard might be taken at times least inconvenient to the parent. A couple of years of steady attendance in the infants' school, and then an alternate day attendance, or an attendance during the six winter months for three or four more years, would be sufficient to qualify most children to pass in the fourth standard by the time they were 10 or 11 years old. An example, made here and there, of a child being deprived of a situation for non-fulfilment of this simple condition, would soon teach all the parents of the neighbourhood to look carefully to the early schooling of their children; and in a few years no parent would like his child to leave school without his certificate. I am sure, from my knowledge of our rural parishes, that such a simple law as this would soon work without any friction whatever, would become in short, after 8 or 10 years, the custom of the country, carrying with it the feeling and approval of both employers and employed."[1]

Advantages of this system.

66. There would indubitably be many advantages in this scheme. It gets rid in great measure of the question relating to the age at which children should begin to work, and it supplies, what is so much wanting, a motive to all parents to send their children to school till they can pass the required test. Thus an excellent influence would be brought to bear on them, not only to send their children to school, but to send them regularly. The sooner the children could be brought to undergo the test, the sooner would the parents be enabled to profit by their labour; and thus what is well known to be the chief obstacle to all successful schooling, irregularity of attendance, would be powerfully counteracted.

The system is plausible, but unsound. Who is to grant the certificate?

67. These reasons are extremely plausible, but after giving them every consideration in my power, I am unable to concur in their soundness. In the first place, who is to grant the certificate? If the Government inspector could do it the difficulty would be overcome; but there are already 80 Government inspectors, their number is now yearly increasing with the increase of aided schools, they are unable to visit any school oftener than once a year; and they were released from the personal examination of evening schools by a Minute of February 1865, because it was found impossible that they could have time to inspect them. If no child is to be allowed to work without having passed the test, every school, and nearly every parish ought to be visited at least four times a year in justice to the children. To cause a poor child to be taken several miles to meet the inspector at any central position would be an unendurable hardship. And what an outcry would be raised if the examination day were fixed, as it often must be, just after the time when work was most plentiful, and the wages of the child most desired by the parents, and its services by the employer. Even if no more schools were inspected than at present, the number of inspectors must be quadrupled to allow of four visits each year. Thus the expence of inspection, which last year amounted to 53,703*l.* (Committee of Council Report, p. 87), would have to be quadrupled. But if a system of universal schools and inspections were established, as this scheme requires, the number of schools and consequent inspections would have to be trebled at least, and the labour imposed on the central office increased in the same proportion, *i.e.*, there would be twelve times as much work to do as at present. What an army of officials would not this require?

Effect of the system on a stupid child.

68. Again, what is to be done with the stupid child, who cannot pass the test? Is it to be sent back to the school till the age of 15, or allowed to pass as incapable of being taught, with a certificate of foolishness. To keep the child at school till 15 will appear out of the question to all who read the foregoing evidence, and hence the latter alternative must be allowed. But it is clear that, with such a door of escape, the pressure on the examiner to pass every child, the parent declaring that the plucked child laboured under a natural deficiency, would lead to a general success in the examination, and so bring it into contempt.

Effect on a clever child.

69. But the condition of the clever child would be harder still. A bright child of 7 or 8 would pass a test that another less gifted child could not pass before 10 or 11. Yet it is to be deprived of all further instruction in consequence of its early ability. Such children, if allowed to continue at school, form the *élite* of the future labourers. This plan, as it seems to me, would end by eliminating all high intelligence from the labouring classes.

Effect of giving a local authority power to grant the certificate.

70. It may, perhaps, be maintained that the power of granting the certificate might be given to some local authority. The effect of committing the examination of night schools to local authorities is not always satisfactory. The Rev. C. D. Dupont, Her Majesty's Inspector of Schools, states in his last report that, while these local examiners passed in reading 90 per cent. of those presented, he could only pass 75 per cent. of

[1] The Education of the People, by J. P. Norris, p. 26.

those presented in day schools, and attributes this difference to the lax methods of the local examiners.[1]

71. The clergyman or the schoolmaster might be empowered to grant the certificate. But, as Mr. Norman observes on this point,[2] the examiners would be exposed to great unpopularity, which would probably induce the ministers of religion to refuse so dangerous an authority, while the schoolmasters would be still more exposed to the pressure of undue influence both from employers and parents to pass every child brought before them, and thus the test might become a mere farce.

Plan of a test examination tried in the Mining Act and failed.

72. The plan of a test examination has been tried by the Mining Act, 23 & 24 Vict. c. 151., in a very mild way, as no male under 12 can be employed in any mine or colliery without a certificate from a competent schoolmaster that he can read and write, and the law seems quite nugatory.[3]

Further objections to pass examinations.

73. The following extract, which I take from the Second Report of the Scotch Commissioners of Education in Scotland, page 137, shows how the certificate system of the Mining Act works in that country :—

"When that Act was passed, says Mr. Sellar (p. 27)—'Providing that children under 12 years of 'age should produce certificates of school attendance, it created a considerable sensation among the 'miners. In one coal-mining school the teacher complained that the colliers had been in the habit 'at first of coming to him, brow-beating him, and threatening to maltreat him, if he ever refused a 'certificate. Of course a weak-minded schoolmaster would succumb at once, and sacrifice his con-'science to his safety. At another school, we were told that just at first certificates were given, '"but none had been demanded for a long time." At another, none had been given for 14 months; 'and in one pit in Annbank Colliery, in Ayrshire, we found that 46 per cent. of the young people 'employed could neither read nor write; and that 8 per cent. could read a little, but could not write 'a letter.

'Lamentable accounts were given on all sides of the state of brutish ignorance in which the people 'connected with this colliery were living. Every one asserted that the children were taken down 'before the statutory age. "I know they used to be taken down very young," one informant said, 'a teacher who had once taught a school in the neighbourhood, "because I kept a night school for '"the mining children, and very young ones, poor, white, stunted things, came to it unable to read '"a word or write a letter."

"Mr. Sellar went down into the pit, and investigated matters for himself. He found 13 boys. 'None of them,' he adds, '*looked* much more than 12 or 13, and some had been five years in the pit.' The result of the investigation was this:—'Of the 13, six could both read and write; one could read 'a little; and six could neither read nor write. Of the six who could read and write, four were 'Scotch and two Irish. Of the seven who could not write, five were Scotch and two Irish. Five 'of these seven children had never been at school at all, and did not know a letter. The other two 'had been at school, one for four or five years, but they had forgotten all they had ever learned.'"

74. But there is, in my opinion, a still stronger objection to any pass examination. It is well known that the effect of a competitive examination is not only to keep the examinees up to the prescribed standard, but to induce them to go beyond it. Every one subjected to a competitive examination is aware that without exertion he is sure to fail in the contest, and therefore has every motive to put forth all his strength in preparing for the trial. A pass examination has an exactly contrary effect. As every one must go through it, the standard must be fixed below the general average ability of the examinees, or an unendurable amount of failures would occur. Mr. Norris proposes that Standard 4 of the Revised Code should be the test required of every child, and the Rev. C. F. Routledge, Her Majesty's Inspector, in his last report proposes that Standard 2 only should be required to be passed by any child 10 years old before it is permitted to begin work.[4]

75. But assuming Standard 4 as the authorized test, this simply requires that a child be required to read "a short paragraph from a more advanced reading-book (than in "Standard 3) used in the school; to write a sentence slowly dictated once by a few "words at a time from the same book, but not from the paragraph read; to work a "sum in the compound rules."

Arithmetical test in Standard 4.

76. What the arithmetic amounts to is shown in the last report of Mr. Bellairs, Her Majesty's Inspector, where he gives as a specimen the following three sums[5]:—

£	*s.*	*d.*
708	17	$6\frac{3}{4} \times 28$
537	15	$8 \div 9$
630	14	$7 \div 8$

and states that he passes every child who works correctly one of these three sums. Now can this be said to be an adequate amount of education to offer to English

[1] Report of Committee of Council on Education, 1868–69, p. 80.
[2] Norman, p. 114.

children? A common effect would probably be that many children 8 years of age would be able to pass it, that they would be then sent forth to labour, and having, as it were, "taken their degrees" would never enter a school again. I fear that the result would be to set up a number of schools throughout the country, whose sole object would be to give the mere mechanical instruction sufficient to enable a child to pass this test, mildly applied as it would be, and so to put a complete stop to all high and advanced instruction.

Mechanical effect of pass examinations, as shown by the Revised Code examinations.

77. The mechanical effect of pass examinations is one of the chief objections that have been urged against the Revised Code, and was foreseen by the Committee of Council on Education, who, in their Report of 1862–63, say, "the examination of individual "children, according to a fixed standard, must always be to a considerable extent "mechanical;"[1] and, in their Report of 1866–67, say, "throughout the schools, the "minimum which each child must learn, in order to pass for a grant under Article 48, "is apt to be of a mechanical character, and to efface that more intellectual aspect "which under the old system struck a visitor looking at one of the best schools as a "whole, rather than at each of its scholars." Mr. Matthew Arnold, Her Majesty's Inspector, in his Report for 1868, complains of the want of "intellectual life" in a school, in consequence of these standard examinations, and laments that "In the game "of mechanical contrivances, the teachers will in the end beat us; and it is now found "possible by ingenious preparation to get children through the Revised Code examina-"tion in reading, writing, and ciphering, without their really knowing how to read, "write, and cipher."[2] Hence my final conclusion, with regard to the proposal for prohibiting the employment of children who do not go through a pass examination, is that it would be a retrograde movement in the educational condition of the country. I am not aware that it has been adopted by any foreign nation.

The certificate system would be a retrograde step in legislation.

Minute and vexatious factory legislation. Impossibility of manufacturers to understand what regulations are enforced upon them by Act of Parliament.

78. Before coming to any conclusion as to the expediency of applying the principles of the Factory Acts to agriculture, I must make a remark with respect to those Acts. They appear to me to require revision; in many points to violate every sound principle of legislation, and to interfere in matters which legislation has no business to touch. I do not believe that it is the province of Parliament to decide how long young persons shall sit at their meals, or the sort of room in which they shall dine, or how many half-holidays they shall have in a year; or to make such distinctions as that cleaning or oiling machinery shall subject persons engaged in it to a variety of minute regulations, while in repairing it they shall be subject to none; or to enact that a manufacturer who dyes cloth Prussian blue shall be bound by a multitude of restrictions, while if he dyes Turkey red he shall be subject to none. All the above and innumerable other rules, which it is difficult to comprehend, are found in the Factory Acts, and often puzzle manufacturers to know what regulations they are bound by Act of Parliament to observe. And when, as often appears, several trades are carried on by one firm in one building, the difficulty of understanding their legal position is almost insurmountable. The following is an extract from the Report of the Commissioner on the Printworks Act and Bleaching and Dyeing Works Acts.

"It is possible that without any unnatural combination of trades, the business of one firm may be, as to one part of the employment under one law, as to another part under a second, as to another part under a third, and as to another part, exempt from any. This no doubt would be an extreme case, but it has been reached by a firm whose business still comes under the Factory Acts, the Printworks Act, and the Bleaching and Dyeing Works Acts, the fourth or exempted branch of their business having been given up (No. 93). Less extreme cases, however, of the different state of the law as regards different parts of the employment in the same establishment or premises, are not so unusual. The business of another firm, all carried on in the same premises, is legally under the Factory Acts, the Printworks Acts, and the Bleaching and Dyeing Works Acts. I was informed by one of the firm that from circumstances they were not aware of being under the latter (No. 94). The premises of another firm are part under the Printworks Act, part under the Bleaching and Dyeing Works Acts, and part under no Act (No. 147). In other cases, part of the employment is under the Factory Acts and part under the Printworks Act, or part under the Printworks Act and part under the Bleaching and Dyeing Works Acts, or part under the Printworks Act and part under no law. The combination may vary according to circumstances.

"10. It is obvious that, unless separate parts of the premises and separate workers are confined simply to the employment falling legally under one or other of the heads as to which the law is distinct, which may not always be convenient, and in some cases seems hardly practicable, it must be difficult, unless by keeping entirely within the limits of the more restrictive law, to guard against confusion and to secure the strict observance of the law, even with the full desire to keep within it."[3]

Inapplicability of factory legislation to agriculture.

79. It is obviously impracticable to apply any of these factory rules to agriculture, but I have given in a former part of this report my reasons for thinking that on the

[1] Report of Committee of Council on Education, 1866–67, p. 21.
[2] Report of Committee of Council on Education, 1867–68, p. 297.
[3] Report on Printworks Act, p. 1.

question of age, 10 might be safely taken as the limit, below which children should not be permitted to be employed in agriculture. Children, however, may be worked in factories at the age of 8, consequently where, as not unfrequently happens, agricultural and manufacturing operations are carried on in the same locality, if 10 were the agricultural limit of age, the Legislature would seem unfairly to interfere in favour of manufacturers and against the agriculturists, as it now interferes in favour of the agriculturists and against the manufacturers. Surely all ought to be treated alike; the Legislature can have no right to benefit one business at the expense of another. On this subject I will take leave to quote some striking observations by the Rev. Canon Norris from his essays before alluded to, on "The Education of the People."

Opinion of Canon Norris of the necessity of a universal restriction of the age of children working.

"The economists require that no manufacturing interest should be placed under a disadvantage, as compared with other manufacturing interests, in its command of labour. In juvenile labour, as in other marketable articles, there ought to be free trade. But what is the state of the case? Our manufacturers of clothing and hardware are trammelled by legislative restrictions in their employment of labour, while our manufacturers of food are free. The farmer may employ children at any age, for any number of hours in the day, while the proprietor of the neighbouring factory or mine can only employ them under certain educational restrictions. Clearly, I think,—so clearly that when stated it seems a truism—all or none ought to be restricted. All are competing one against another for the children's labour, all desire to obtain it on the cheapest terms. Is it fair that labour in the mill should be stinted by law, while labour in the adjoining farm is entirely unrestricted? And yet such is the case. And what is the result? That the children are forsaking restricted employments, and flocking into those that are unrestricted. The factory inspectors, while they unanimously commend the educational effect of the Factory Acts, confess at the same time that there has been a serious diminution in the number of children employed in mills. Since the passing of these Acts numbers of children have left their half-time employment in the mill to seek full-time employment at an earlier age in shop or farm service. The same will be the case in our collieries. The difficulty of finding an adequate supply of young hands is daily increasing, and will go on increasing, if other employments continue to be unrestricted. Thus, in some of the most important branches of trade (such as our cotton trade and our coal trade), the cost of production is unfairly raised by our present partial measures. We must recede or advance in this course of legislation. To recede, to go back to the frightful evils of the old factory and colliery system, described in the reports of the Children's Employment Commissioners, but now happily a matter of bygone history, would be infatuation. Advance we must; political economy and education alike demand it. The economist demands that all or none should be restricted, and the educationist demands that the undoubted blessings of the factory legislation should be extended to other classes of children." [1]

Agricultural children might be safely prohibited from working under 10 years of age.

80. After considering these various points I am disposed to agree in the following observations of Mr. Fraser:—

"Instead, therefore, of applying, with very doubtful prospects of success, the regulations of the Factory Acts to agriculture, I should like to see, as the Commissioners of 1861 wished to see, the Factory Acts themselves revised. I am satitfied that the age of eight is too early, on physical grounds, for children to go to constant work; I am satisfied that the age of eight is too early, on educational grounds, for them to commence half-time or periodic attendance at school." [2]

Commissioners of 1861 propose that Factory Act should be revised, and that it is too early for a child to work.

81. I have stated my opinion that, under present circumstances, 10 is the proper age for children to engage in agricultural work, while eight is the legal age for beginning factory work. Seeing the great advantage of introducing one universal and simple law, and the justice of not interfering in favour of or against any particular occupation, would it not be best to raise the factory limit of age to nine, and place the agricultural children under the same restriction as respects age? Thus we should have one universal law applicable to every child throughout the kingdom, and preparation would be made for a system of general education for every one at least up to the age of nine.

Proposal to make a compromise between the factory age for work and the agricultural age, and prohibit all children working under.

82. I have ascertained by inquiry that there would be no great difficulty with manufacturers in assenting to the age at which children are allowed to work in their factories, being raised one year. Messrs. Orr, Ewing, and Co., the proprietors at Levenbank of large dyeing and print works, in which they employed last winter 455 children and young people, say, "We admit that the educational part of the Printworks Act is defective, and "that the power to employ children at eight years of age is too young. We, therefore, "would have no objection that the earliest age, at which children should be permitted "to be employed should be increased to 10 years." [3]

This proposal may appear too timid, but there is a necessity of caution in commencing

83. It may possibly be objected that the prohibition up to the age of nine only, is too trivial an improvement, that it is unworthy of the Legislature to take such timid steps towards removing evils so generally acknowledged, and that at least we might begin by placing the limit of working age at 10. To this, I reply, that we are commencing a far wider and more complete interference with the labouring classes, than has even been known before; that it is necessary to proceed by very slow and cautious steps, and that if we pass a law not supported by general opinion, it would remain in-operative, and thus bring the Legislature into contempt, and possibly materially hinder, by

[1] The Education of the People, by J. P. Norris, p. 35.
[2] Fraser, p. 29.
[3] Report on Printworks Act, p. 75.

re-actionary effect, future progress. Besides, the advantage of one universal simple law is so great, that it is worth while for the sake of it to make this compromise between factory and agricultural workers, and place all under the same regulations in respect of age. a general interference with child labour.

84. Mr. Stanhope gives in his Report one instance of the inutility of endeavouring to carry out by law, what is not supported by general opinion. It has been enacted that boys under 13 shall not drive carts on a turnpike road, which Stanhope remarks "was "probably based on the ground of danger, either to the boys themselves or to the "public using the high road. This anticipation is not borne out by the evidence I have "obtained; hardly any accidents, and those to men as often as to boys, from negligence "in sitting on the shafts, are stated to arise from it." And alluding to some other proposed restrictions, remarks,— Instance of the impossibility of carrying out a law not supported by general opinion.

111. "That there would be very great difficulty in enforcing any such restrictions, unless they fall in to a certain extent with the public opinion of the country, may be shown by a very strong instance. By the Act 3 Geo. IV. c. 126. sect. 131, no boy under 13 is allowed to drive a cart on a turnpike road. This provision is not only evaded throughout my district, but is absolutely ignored. Very few of the magistrates to whom I spoke of it had ever heard of it, much less had ever enforced it, and it is practically a dead letter."

85. On this point of the danger of incautious interference with children's employment, the words of the late Prince Consort, which I heard him deliver at a meeting called in 1857 to consider the possibility of enforcing increased attendance at school, are worthy to be kept in remembrance:— Opinion of the late Prince Consort on this subject.

"What measures can be brought to bear upon this evil (of non-attendance at school) is a most delicate question, and will require the nicest handling, for there you cut into the very quick of the working man's condition. His children are not only his offspring, to be reared for a future independent position, but they constitute part of his productive power, and work with him for the staff of life. The daughters especially are the handmaids of the house, the assistants of the mother, the nurses of the younger children, the aged, and the sick. To deprive the labouring family of their help would be almost to paralyse its domestic existence."

86. In my opinion 10 ought, after a certain short period, to be the age, below which no child should be allowed to work, and possibly when further experience of the effects of these restrictions is acquired, it might be extended to 11 or 12; but at present I confine my recommendation to the proposal, that all children, whether factory or agricultural, be prohibited from working under the age of nine, except during 10 weeks of school holidays, and that in two years after the passing of the Act, the prohibition should be advanced to the age of 10. The prohibition of the age of working might be extended to 10 after a short period, and ultimately to 11 or 12.

87. Further it is my opinion, that simultaneously with the above prohibitions, some general system of education should be set on foot throughout the country, and that without the establishment of some such system, the above plan of an immediate restriction of all children from working under the age of nine ought not to be carried out. This second recommendation tending to the universal establishment of schools, I consider an essential and indispensable supplement to any proposed restriction of the working age of children, and that without it no measure restrictive of age ought to pass. Simultaneous with the above prohibition, a general system of education ought to be established, and without this the prohibition of age ought not to be enacted.

88. Perhaps it may be considered impolitic to insist on the prohibition with respect to age till schools are universally established. Now I believe that such a prohibition would tend more than anything else to the multiplication of schools where necessary, and supposing a scheme for universal education to be set on foot at the same time, the stimulus to increase and improve the schools everywhere would work with powerful effect. A general system of education must be accompanied by a survey of our existing wants and shortcomings, and the prospects of a rate or of some special Government interference, unless the present deficiencies were speedily filled up, would probably force immediate attention to the subject in every locality, and by exciting voluntary action, supersede the necessity of action by a central authority. Effect of passing a general system of education in inducing the erection of schools voluntarily where wanted.

89. But in truth through a great part of England schools are abundant enough, and what is wanted is not so much the establishment of fresh schools, as the improvement of existing ones. Mr. Stanhope reports that— Schools are tolerably abundant, but improved ones wanted.

"In Lincolnshire and Nottinghamshire the number of parishes in which there is no school is certainly small. The demand for education among the labouring class is exceedingly active, and if from any cause a school is closed, a dame's school springs up almost immediately."

90. The Rev. W. S. Thomason writes, after a careful survey of the fen and march district—

"There is hardly a house in the whole district which is not within three miles as the crow flies of one of the Government schools."[1]

[1] Stanhope, p. 84.

91. Mr. Portman reports nearly to the same effect of Cambridgeshire and Yorkshire. He says :—

"I do not find that there is any want of accessible day schools. Throughout the portions of the West and North Ridings which I visited there appeared to be no dearth of available schools, and the state of education is probably better than in many parts of England."[1]

92. Mr. Norman's report on Northamptonshire says :—

"The defective state of education is certainly not owing to the want of schools, for schools are maintained in almost every village, and the villages are very numerous."[2]

93. Mr. Stanhope writes in his second report that—

"In Dorsetshire and Kent schools are for the most part in existence within reasonable reach of the mass of the population, and in the latter county are on the average of a very high order. The great and crying want of all these districts is not additional school accommodation. In every county, if private schools be included, it is at present in excess of the demand."

94. Mr. Culley, in his second report, says :—

"Judging from the parishes I visited and the evidence I received on the subject, there can be very few children in either Oxfordshire or Berks who are not within a tolerably easy walk of some school."[4]

95. The Rev. Canon Norris writes :—

"In the three counties with which I am officially connected (Staffordshire, Cheshire, and Shropshire) there is no mining or manufacturing district in which a child could complain that no school was within reach. In the agricultural districts there are very few parishes that are still without day schools, none in which a school competent at all events to teach reading, writing, and ciphering, would not be speedily established if the parishioners desired it."[5]

96. Mr. Fraser reports :—

"I do not believe, if it were properly distributed, that there is any deficiency of school area in relation to the wants of the population. At the date of the Duke of Newcastle's Commission there was a considerable surplus; and though certainly the population has considerably increased in the last 10 years, the work of school building also has not stood still. In the 10 sample districts selected by the Commissioners (comprised in the counties of Lincoln, York, Nottinghamshire, Suffolk, Norfolk, Cambridge, Dorset, Devon, Somerset, Hereford, Worcester, Cumberland, Westmoreland, Lancashire Stafford, Warwickshire, Durham, North Wales, Cornwall, Middlesex) there was an excess of 46·7 per cent. of accommodation at eight square feet per scholar, so that for each 100 scholars in attendance, there was accommodation for 146·7."[6]

97. I am aware that many of these schools are bad, but their existence shows the desire of the populations for education, and working on these nuclei it should be the duty of the Minister of Education, whose appointment seems inevitable, to improve and extend the means of obtaining instruction to all the labouring classes, and especially to adopt measures for the general establishment of infant schools and night schools, which latter appear to supply the most certain guarantee of keeping up the learning that has been once acquired.

Failure of the educational clauses of the Printworks Act a sufficient reason for not re-enacting them for agriculture.

98. I think the generally acknowledged failure of the educational clauses of the Printworks Act is a sufficient reason for introducing no such regulations at present among the agricultural populations, more especially on commencing a general interference with the age of sending children to work, such as I have been proposing. If the labourers can ever be brought really to value education, they will voluntarily adopt some such scheme, as they actually have done in Northumberland, where Mr. Henley, speaking of the school attendance prescribed in the Printworks Act, says, "that a plan similar to "this is now carried out in the district by the parents themselves as the best method of "obtaining for their children the instruction they so highly value."[7]

Compulsory education.

99. Many witnesses examined under this Commission have expressed approval of a compulsory system of education, and the inspectors of the Committee of Council, "who "refer to the question of compulsory education, express themselves, without exception, "as favourable to the principle of it."[8] Crowded meetings of artizans at Manchester, Glasgow, and several other towns, have called for compulsion, and at the last meeting of the Social Science Congress at Birmingham, when Mr. Fawcett, in my hearing, addressing an assemblage of 2,000 working men in the Town Hall, proposed a plan for compulsory education, the proposal was received with the loudest acclamations of approval that the vigorous lungs of the meeting could send forth.

100. It appears to me that universal establishment of good schools must be an essential preliminary to any compulsory plan of education, and such schools could only exist after some general system of education had been some years in existence; and then possibly the necessity of compulsion may have passed away, owing to the willingness of the

[8] Report of Committee of Council on Education, 1868–69, p. 39.

population to accept the good instruction offered. At present, as is observed by Archdeacon Hankinson, it would be impossible to apply a system of compulsion with any equity till we have established throughout the country a complete system of efficient schools. "To compel a child to spend five or six years of his life at a school where he "could learn nothing really profitable would be an unredeemed hardship."[1]

Apathy of parents one of the main obstacles to education.

101. I believe the truth to be, that with all intelligent workpeople, who feel thoroughly the advantages of education and take care to provide it for their own offspring and therefore would never incur the penalties of evading a compulsory law, a compulsory system is popular, from a benevolent wish to extend the benefits of education to all around them. But unfortunately this is not the character of the great majority of the agricultural labourers. The indifference of the parents to education is the great obstacle to be surmounted, and until that is overcome the opposition to a compulsory system would be too powerful to encounter, and when it is overcome, and the universal establishment of efficient schools will, I believe, alone affect it, compulsion will be unnecessary.

102. The evidence collected by the Assistant Commissioners contains numerous proofs of this apathy of the parents with respect to the mental improvement of their children Mr. Stanhope observes:—"The main cause of the absence and irregularity of the "children is undoubtedly the ignorance and neglect of the parents."[2] Mr. Fraser remarks:—"The apathy and low moral tone of the parents, exhibiting itself in indifference as to whether their children attend school or not, and in their retention at home "on very trifling pretext, are much more serious difficulties."[3] Mr. Norman mentions as the chief cause of the backward state of education:—"Indifference on the part both "of the parents and the employers; as a general rule neither the one nor the other is "willing to make any sacrifice to obtain an education for the children."[4]

103. The reports of the inspectors under the Committee of Council on Education speak to the same purport. The Rev. G. French says:—"I find that managers and "teachers are alike loud in their complaints of the apathy and unconcern of parents "with regard to the education of their children. I am again and again told that the "people do not care to send their children to school." And the Rev. H. Sandford says:—"It must be allowed that neither the demands of the labour market any more "than the inability of the parents to pay adequate school fees are, in a large number of "cases, the reason why the young receive an imperfect education. Doubtless the prospects of education are worst where the young are most absorbed in excessive labour, "but there are numbers of children deprived of education through mere neglect of "parents, or the real or fancied claim of home duties."

Inutility of compulsory education in Prussia and Switzerland.

104. In countries where compulsory schooling is adopted the result does not seem to be such as to warrant its introduction here. The system is in existence in Prussia, and Mr. Pattison in his Report to the Newcastle Commissioners observes:—"The schooling "is compulsory only in name; the school has taken so deep a root in the social habit of "the German people that were the law repealed to-morrow no one doubts that the "schools would continue as full as they now are. In the free city of Frankfort there is "no compulsory law, and I was assured by persons most likely to be informed that all "the children of school age are as regularly sent to school there as in any other town of "Germany."[6] The Rev. Canon Norris remarks:—

"If we turn to Switzerland we find Mr. Arnold reporting that in the Canton Vaud, where the law is most stringent, his inquiries led him to doubt whether the law is really ever executed at all; and his conclusion is, that though primary instruction is most prosperous in the Canton Vaud, 'the making 'it compulsory by law has not added one iota to its prosperity. Its prosperity is due to the general 'comfort and intelligence of the population. Where these are equally present, as in Geneva, the 'prosperity of education is equal, though there is no compulsion; where these fail the compulsion of 'the law is powerless to prevent the inevitable check inflicted on education by their absence.'"[7]

Opinions of the Newcastle Commissioners on compulsory education.

105. The Newcastle Commissioners finally sum up their opinions on this question in the following sentence:—"Any universal compulsory system appears to us neither "attainable nor desirable."[8] I concur in this opinion at present, though I imagine it may be desirable at some future time, when good schools are universal, to pass a law to enforce education on the waifs and strays of society, the street Arabs of our large cities, who may be found to resist all ordinary attempts to civilize them.

No further interference

106. The evils of the gang system appear to have primarily called attention to the subjects treated of in this Commission; but the Act for the Regulation of Agricultural

[1] Fraser, p. 22. [2] Stanhope, 2nd Report, p. 18. [3] Fraser, p. 22. [4] Norman, p. 113.

[6] Report of Newcastle Commission, p. 193. [7] Education of the People, by J. P. Norris, p. 24.
[8] Report of Newcastle Commission, p. 300.

required with agricultural gangs.

Gangs, passed in 1867, seems to have effectually remedied the chief disorders complained of as regards public gangs. A private gang is defined to be "a group of children, young "persons, and women in a farmer's own employ, and superintended by one of his own "labourers." Any interference with workpeople so employed seems to me utterly beyond the province of legislation. So far as any evil arises from employing too young children in these gangs, the general law, which I have proposed above for restricting the employment of young children, will be a sufficient remedy. I think it unwise to do more.

Insufficiency of cottage accommodation cannot be remedied by the legislature.

107. There is a very general complaint of the want of sufficient cottage accommodation for the agricultural population, but here I am unable to see how the Legislature can interfere to any good purpose. The Union Chargeability Act has done all that it is in the power of Government to do, but the Legislature must not take credit for having by that Act directly done anything to remedy the evil of inadequate dwellings for the poor. All that it did was to remove from landlords the motives, which the Legislature itself had created, not to build cottages, and was really a step towards the *laissez faire* principle. Perhaps some slight advantage might ensue if the rules of the Enclosure Commissioners, or of the Public Works Loan Commissioners, who are empowered to regulate the conditions, under which money borrowed for the erection of cottages is expended, were relaxed;[1] but probably the Commissioners have sufficient reasons for the regulations they have established, and would doubtless alter them, if reasonable grounds could be alleged in favour of a change.

Danger of over legislation.

108. Possibly also some more effectual sanitary inspection of cottages might improve them. But here again we enter on the dangerous ground of over-legislation, and to insist that every cottage shall be supplied with every convenience that benevolent people think necessary, might simply end in preventing the building of cottages; just as the Act of 1562, mentioned in the first part of this Report, which was intended to force the annexation of allotments to all cottages, no doubt an excellent object, was repealed because it was found to prevent the erection of cottages.

109. Numerous complaints are made respecting the impropriety of employing women in agriculture and the immorality resulting from it. But here I must revert to the principles of legislation mentioned in the first page of this Report, within which I stated my recommendations should be confined, and beyond which I think no Government has a right to go. I think we ought to prevent every child from being cruelly treated or educationally neglected, and of course forcible cruel treatment of any person, young or old, ought to be and is punishable by law; but it is beyond the proper function of Government to restrict persons, who have arrived at years of discretion, from gaining an honest livelihood in any way they please.

Mr. Henley's Report on Northumberland.

110. I should wish to direct particular attention to the remarkable report on Northumberland by Mr. Henley. The agricultural wages there appears higher than anywhere else in England, being from 15*s*. to 18*s*. weekly. Yet, observes our Assistant Commissioner, Mr. Culley, himself a Northumberland landowner, and who reported for this Commission on Bucks and Bedfordshire:—

> "The earnings of the Northumberland labourer are very little higher than those of any fairly industrious man in Bedfordshire or Bucks, and yet he is mentally and physically a superior animal, treating his family in a manner which three or four times the difference in wage would not account for. What then are the causes operating in his favour? I take them to be chiefly the following:
>
> He has no need of a club, his hiring is a yearly hiring and his wages are paid when he is sick as punctually as when he is at work.
>
> His own earnings and those of his family all go to the family purse, and suffer very little variation.
>
> And last, but not least, it is not his habit to drink beer, except at the annual hiring; he hardly knows what a beershop means, and his children suck at the milk bowl instead of himself at the beer jug.[2]

Causes of the superiority of the Northumbrian labourer over the southern.

111. These alleged causes of the superiority of the northern labourer do not satisfy me. Why should he put his earnings into the "family purse" and the southern labourer not? Why should he not drink away his wages at the beershop, as is the practice in the south, and how is it that he can insist on his wages being paid when he is sick, as punctually as at work? The law is the same in Northumberland as in Bucks. The real truth appears to me to be that he is better educated, and hence is both "mentally and physi- "cally a superior animal." He has that within him, which enables him to insist on the best treatment and the highest wages, and to resist the vicious allurements, which degrade the condition of the workpeople in the south.

---

[1] Henley, p. 68.

[2] Culley, p. 138.

112. Of Northumberland Mr. Henley writes: "There is a general concurrence of "feeling among employers and workers that no child should begin labour before 10 "years of age; and it rarely, if ever, happens that they are employed in North "Northumberland at an earlier age. I never found a mother of a family, however "large, who did not assent to this, usually adding '10 is young enough,' which in "Northumbrian dialect means 'too young.' And the Hexham Board of Guardians "declared that they did not want either boys or girls till they are 14 or 15." [1]

113. As a proof of the healthiness of the Northumbrian population, Mr. Henley quotes the Registrar General, who says of the Glendale Union, one of the largest agricultural unions in Northumberland,[2] "It is a model district in statistical tables. With "Farnborough, Bellingham, and Rothbury, it stands a monument of salubrity, to which "a sanitarian immediately turns, when he seeks a comparison or would direct an aim. "In the 10 years 1851 to 1860, the average mortality of Glendale was only 15 deaths "1,000 living." The general average of England is 22 per 1,000. But it is in education that the condition of the county seems most striking, and in this I am persuaded lies the main secret of the prosperous condition of the Northumberland labourer. Mr. Henley gives in his report a table, which shows, that in despite of some circumstances that make the table probably to err on the side of defect, "in the summer 1 in 7·3 of the whole "population of Glendale is at school, and in winter as many as 1 in 5·9." [3] This exceeds the Prussian proportion of 1 in 6·21. What would be said in the south to this opinion given to Mr. Henley by a large employer at Embleton: "Public opinion "would send any man earning wages to the position of a brute, who did not send his "child to school"? [4] What an advanced state of education is indicated by the possibility of the existence of such facts as the following:—

Education the secret of the prosperity of the Northumbrian peasants.

"105. The following fact was communicated to me by the Rev. John Young, who has been for 38 years Presbyterian minister at Bellingham. 'A few shepherds on the hills keep a schoolmaster among 'them, and they lately commissioned me to procure for them Virgil, Horace, and Cæsar. Of these 'people one family come nine miles to church on foot; one is a woman, the rest are men.'

"132. Some aim at higher pursuits and a better scale of education, as we may learn from the evidence of Mr. Duncan, English Presbyterian schoolmaster at Wooler, who says that—'At this time 'there are four boys in his school learning Latin; one the son of a gamekeeper, another the son of a 'shepherd, the third the son of a skinner of sheep, and the fourth the son of the widow of a railway 'porter. Two others learn French and Euclid; one of these is a shepherd's son, the other a hind's. 'This shows the anxiety of the parents for education.'" [5]

114. I do not mean to maintain that it is desirable to provide means for all labourers' children to learn Latin or Euclid, but I quote these instances as proofs that, without a general feeling in favour of education among all classes, such salient instances as the above could not exist. Mr. Henley adds that the farmers themselves are equally desirous to promote education. He says:—

"137. Before quitting this subject I cannot refrain from pointing out that the farmers of this district, so far from being lukewarm in promoting the education of the children of their labourers, or hostile to it (as they are said to be in other parts of the country), give every possible encouragement to the schools; in some cases supporting them altogether, and in others paying the school fees of the children entirely or in part." [6]

115. Mr. Henley concludes his remarks on education in the following words:—

"224. It was gratifying to find how few instances of total ignorance I met with among the children and young persons at work. They are hardly worth recording, being so exceptional. The standard of instruction was of course unequal, but there was an absence of that gross ignorance which is said to prevail in other less favoured counties.

"225. I cannot too often repeat, that in this district the pressure for education comes from the people themselves, though the higher motives which dictate it may have been instilled into them by their spiritual pastors. The population in the north of the county possess this feeling to the greatest degree." [7]

116. I would not be understood to assert that the condition of Northumberland is such as to be incapable of improvement. Several shortcomings are pointed out in Mr. Henley's Report, and it would undoubtedly be benefited by the establishment of a universal system of education; as there is a complaint from the labourer, certainly unusual in other parts of England, that the schools do not satisfy their requirements as to quality. But the general state of the wage-classes is so satisfactory, that I have no hesitation in asserting, that if all England had been like it, this Commission ought not to have been issued. [8]

If all England had been like Northumberland this Commission would have been useless.

117. Lest it may be supposed that Mr. Henley's account is overdrawn, I may observe that it is fully confirmed by the Report of Sir F. H. Doyle, who made a similar investi-

[1] Henley, p. 60. [2] Henley, p. 52. [3] Henley, p. 64. [4] App., p. 255. [5] Henley, p. 64. [6] Henley, p. 64. [7] Henley, p. 71. [8] Henley, p. 62.

gation into the condition of the county under the authority of the Poor Law Commissioners in 1843, which was presented to both Houses of Parliament in that year.

There are no direct methods of curing by legislative enactment the numerous evils that afflict the agricultural population.

118. It may possibly be objected that my recommendations go a very little way towards curing the numerous evils, affecting the condition of the agricultural population, pointed out by the able reports of the Assistant Commissioners. How, it may be asked, will the evils of inadequate wages, of miserable habitations, of vicious habits and customs, of the mixture of sexes in the field, of the neglect of their families by the employment of married females in farm work, &c. be remedied, or even palliated, by simply prohibiting the employment of children under 9 or 10 and establishing a system of general schooling. My reply is that there are no direct methods of applying a remedy to any of the above evils, and that there is but one way, and one way only, by which they may be eventually overcome, and that is by increasing the intelligence of the labouring classes, in other words, by a system of universal education which will make these classes the moving agents of their own improvement.

119. I will therefore conclude this Report by pointing out how improving the intelligence of the poor does certainly and safely, with the least possible disturbance or interference with the employers or employed, tend to annihilate all the evils which so many of the witnesses seem to think can only be met by direct authoritative measures.

120. The disgraceful state of the cottages is the theme of almost universal complaint. But the large landholders have everywhere been improving the condition of their cottages. In Northumberland Mr. Henley reports:—

"On the large estates of Earl Grey and Mr. Cresswell Cresswell, attention is particularly attracted by the excellence of the cottages. The Dukes of Northumberland have in this county built and improved 931 dwellings for farm and other labourers on their estates during the last 20 years. The work of improvement is rapidly progressing, and I could mention many other estates on which they are all that could be wished." [1]

121. Even more seems to have been done on the estates of the Duke of Bedford, of whom Mr. Culley, himself a Northumbrian landowner, remarks:—

"It has never been my good fortune to see any large estate upon which so much has been for many years past, and is now being done for the comfort of all persons connected with it, as on that of the Duke of Bedford." [2]

122. Mr. Fraser reports to the same purport [3]:—

"In the districts over which I have travelled, amid many instances to the contrary, it was pleasant also to find not a few of the largest landowners setting a noble example of their consciousness of responsibility in respect of the dwellings of the labourers who cultivate their land. I may select for special mention, the names of the Marquis of Cholmondeley and the Earl of Leicester in Norfolk; of the Duke of Grafton and Sir Edward Kerrison in Suffolk; of the Duke of Richmond, Lord Leconfield, and the Hon. Mrs. Vernon Harcourt in Sussex; of the Earls of Ducie and St. Germains in Gloucestershire. I do not mean to say that the estates of these noblemen and gentlemen are everywhere adequately supplied with labourers' homes; Lord Lecester has publicly admitted his own great deficiency; but all are working onward in the right spirit to the right end, and their example tells upon other landowners with an effect proportionate to its conspicuousness. There are some grounds for hoping that, 25 years hence, the villages of England will present a different and a more pleasing picture to the eye of the traveller than they present now." [4]

Increasing the intelligence of the wage classes is the sole cure for the evils they suffer.

123. I mention these facts, which might be multiplied, to show how improvement is going on, and I doubt whether legislative compulsion would induce the landowners to do more, possibly not so much as they have done. But the labourers themselves often oppose the benevolent intentions of the landlords by not having sufficient intelligence to appreciate the advantages of decent cottages. The Earl of Kimberley said in a meeting of the Norfolk Chamber of Agriculture,—

"We have given a very good cottage to a labourer, and we find that he does not appreciate it at all. He puts his apples into one room, does not inhabit another, and would put his pig into another, if we would let him." [5]

Uneducated labourers do not value good cottages.

124. Sir George Jenkinson said in the Gloucester Chamber of Agriculture, speaking of the difficulty of getting labourers to value decent habitations:—

"If you built a palace and furnished it to match, you would scarcely induce them to leave these

[1] Henley, p. 66. [2] Culley, p. 124. [3] Fraser, p. 39.

[4] The Report of the Scotch Commissioners on Education show that even where cottages are worse than anywhere in England, consisting only of one room for all purposes, the evils complained of here do not necessarily occur. They say of the Hebrides:—"As the great majority of the inhabitants live in houses of "only one apartment, it may tend to modify the opinion which is sometimes entertained as to the immoral "tendency of such schools and dwellings, to learn that, according to the Registrar-General's Returns, the "per-centage of illegitimacy is less in the Hebrides than in any other district of equal extent in Great "Britain, while the grosser crimes are all but unknown."—Second Report of Scotch Commissioners on Education, p. 79.

[5] App., p. 15.

places, into which you would hardly put a pig to live. He had at that moment cottages unoccupied through the refusal of labourers to leave their own hovels."[1]

125. The Rev. Hinds Howell, chairman of the Drayton Board of Guardians, Norfolk, says:—

"In several instances since I have been rector of this parish I have had to complain of overcrowding, but at present there is only one instance, but that of the grossest kind, inasmuch as the wages are abundant to supply good accommodation."[2]

126. The Rev. J. Cane, rector of Weston, Nottinghamshire, says:—

"Where there are three bedrooms, I often find that the third is very little used."[3]

127. And a report to the Biggleswade guardians says:—

"In several of the cottages with two bedrooms, the father, mother, and children were huddled into one room, and the other bedroom is let to lodgers."[4]

Educated labourers do appreciate good cottages.

128. It is clear that it is the want of intelligence that prevents the poor from appreciating decent dwellings when offered. On the other hand, the best and most intelligent labourers are in the habit of not only appreciating but demanding comfortable cottages. Thus Mr. Henley reports from Northumberland:—

"A good hind in the present day requires extra wages in money or kind to bribe him to occupy what is so miserable for himself and family: and the farmer must either pay extra wages, or remain content with second-class labour."[5]

129. Mr. Calthorp, writing from Lincolnshire, says:—

"There is a growing feeling among the labouring class to look before them when they are entering into an engagement. They ask now what sort of a master, what wages, what sort of a cottage, how far from work? And I am quite sure that the increased difficulty in getting labourers will oblige some of us, farmers or landlords, to provide better cottages and more of them."[6]

Women are less employed than formerly in agriculture.

130. Many witnesses require that especial restrictions should be put on the working of females as degrading. I have stated above my opinion that it is contrary to sound principle to enact any such restrictions; but there is a vast change going on silently with respect to the employment of women attributable, in my view, to the improved education and consequent clearer conception of their duties that has resulted from the Government aided schools now distributed throughout the land. Mr. Fraser says:—

"Everywhere I heard the same story, that women are found to be less and less disposed to go out to work upon the land. They will refuse unsuitable work, they will stay at home on wet days. Whether from the easier circumstances in which they live, or from their having become intelligent enough to take a more accurate measure of loss and gain, there seems to be much less attraction for them in the farmers' 8*d.* or 9*d.* a day than there used to be. Agriculture, I presume, has not declined in the last quarter of a century in the counties of Gloucester, Essex, and Sussex, yet not a fifth part of the number of women is employed upon the farms of these counties now that was employed upon them 25 years ago."[7]

131. Mr. Norman reports from Northamptonshire:—

"On the whole it is quite clear that it is the exception rather than the rule for a woman to go to work in the field."[8]

132. Mr. Culley says, "It is not the custom to employ women in farm labour in "Bedfordshire."[9] And Mr. H. Tremenheere gives the following evidence from Cumberland:—

"'As to the employment of women in the fields,' writes Mr. George Moore, a gentleman to whom Cumberland is greatly indebted for his admirable schemes for the improvement of education, 'I think that in another generation it will be discontinued, as I observe amongst the girls educated in the schools in many parts of Cumberland that they show a decided aversion to field work, and it would only be by those whose character was lost or who had not been regularly to school that rough farm work would be chosen. In past years there was nothing done to civilize or indeed to humanize the labouring classes of Cumberland.'"[10]

Agricultural work not degrading to females.

133. Those who talk of the degradation of employing women in agriculture, and the propriety of restricting it by law, should read the following extract from Mr. Henley's Report:—

"28. There are many who hold the opinion that field work is degrading, but I should be glad if they would visit these women in their own homes after they become wives and mothers. They would be received with a natural courtesy and good manners which would astonish them. Let the visitor ask to see the house; he will be 'taken over' it, with many apologies that he should have seen it not 'redd up.' He will then be offered a chair in front of a large fire, with the never-absent pot and oven, the mistress meanwhile continuing her unceasing family duties, baking, cooking, cleaning, &c. Not one word of complaint will he hear; but he will be told that, though 'working people,' they are not poor; and a glance at the substantial furniture, the ample supply of bacon over his head, the variety

of cakes and bread on the board, and the stores of butter, cheese, and meal in the house, will convince him of the fact. When he inquires about the children he will hear that though they have not much to give them, the parents feel it to be their sacred duly to secure them the best instruction in their power, and '*that* they are determined they shall have.' The visitor will leave that cottage with the conviction that field work has had no degrading effect, but that he has been in the presence of a thoughtful, contented, and unselfish woman."[1]

134. And he adds this strong remark:—"To prohibit female labour in this district "would simply be to prohibit farming."

135. I think the inevitable conclusion from the above evidence is, that where farm work has been found to be really unsuited to females, from whatever cause, the increased intelligence of the people is rapidly putting an end to it, and where it is suitable, restricting it would be tyrannical and absurd.

Improving education tends to remove superabundant population, and increase wages.

136. Finally, I wish to show that improved education will effectually tend to diminish population where it is overcrowded, and to increase wages, the smallness of which is everywhere alleged, as together with the ignorance of the parents, to be the main reason among the agricultural classes for refusing to send their children to school, or to keep them there a sufficient time.

Best educated labourers get to higher work than farm work.

137. I think it unnecessary to refute the arguments that may be met with in the evidence, than an uneducated labourer is more valuable than an educated one. The notion that a man who has been taught to think, and to understand his duty to God and to man, will perform that duty less efficiently, seems to me an outrageous absurdity.

Reason of the farmers' objection to education.

138. Yet the farmers are often much opposed to educating the labourers, for a reason that I have hinted at above, that it really does tend to make them dissatisfied with low wages, and so often to induce them to leave the parish for the higher earnings that may be got elsewhere. On this point Mr. Stanhope remarks:—

"117. It is a common charge, brought against farmers as a class, that they care little for education and are rather disposed to discourage it. Now in many cases it cannot be denied that education is materially interfering with labour, because the object of the labouring class in seeking it is not to make their children better agricultural labourers, but to enable them to rise to a higher sphere in life. 'If 'I could only get him to be a scholar,' said one woman, 'he should never be a farm labourer.' 'If I were a scholar I shouldn't be here,' said a labourer, 'and that's the reason why the farmers 'hold against this 'ere scholarship.' (Evid. 187.) One cannot therefore be surprised that farmers should wish so to direct education as to prevent its having this effect as far as possible. 'Their view 'is that more than a little is very much too much; they are afraid that labourers will be spoiled for 'field work.' (Evid. 273.) Their object is to keep the school down and not to let it rise beyond a certain level. In consequence of this, their contributions to the school funds often amount to a small sum."[3]

139. Mr. T. L. Taylor, who farms 350 acres in Norfolk, says:—

"He finds an increasing tendency in the most promising and best educated boys to get away from farm work to other employments."[4]

140. Mr. Howard Taylor, a solicitor at Norwich, says:—

"The educated sons of the labourers, more conscious of their value, have displayed an exaggerated independence, and are prone to desert their father's calling for more remunerative occupations brought within their reach by early instruction."[5]

141. The Rev. W. T. Beckett, rector of Ingoldesthorpe, says:—

"Several employers of labour have expressed their opinion to me, that educated boys are more useful on the farms, and that the only objection they have to their continuance long at school is that their services as farm labourers are generally lost to them, as they aim at a higher position either as domestic servants or in other occupations."[6]

142. The Rev. S. Surtees, rector of Sprotburgh, Yorkshire, says:—

"All our most intelligent boys and the sons of the more intelligent and better off labourer are, speaking generally, put to a trade or brought up to other occupations. They do not bring up their sons to field work."[7]

143. Mr. Culley remarks:—

"One argument I have often heard urged against a local tax for educational purposes, is that the object of the improved education is to put the children in a position to be able to carry their labour to the dearest market, and so deprive of their services the parish or district, which has paid for their education."[8]

144. The Rev. A. Hanbury, vicar of Bury, Suffolk, says:—

"The schools have been, I consider, an incalculable blessing to the parish. To this assertion the farmers doubtless would in some measure demur. Hitherto they have been very liberal in their sup-

port of them and have been proud of their success, but they are complaining and with some reason that all the sharper lads are migrating to London and other large towns, and the 'clods of the valley' alone remain. The fact is so, but I believe that the facility of communication by railroad and by penny post, and the circulation of information by the press, are more instrumental to this even than education, though no doubt the latter helps them to better situations."

145. [1] The Earl of Lichfield said at a meeting of the Central Chamber of Agriculture in London:—

"It appeared to him then that some of the speeches to which he had listened went against all education for the children of agricultural labourers. He considered, however, that a great fallacy lay at the root of the objection raised, that if children got something above the ordinary amount of education they were immediately unfitted for agricultural labour. Why was that? He maintained that it was simply because it was an exception to the rule that such children obtained an education that fitted them for anything else. The demand for a rather better education than was received by the ordinary class of children turned out of our national schools had of late years been too great for the supply, and the consequence was that wherever a child was somewhat above the common level of intelligence or was better educated than his fellows he would probably be taken away from the parish in which he had been bred and educated, and thus be lost as an agricultural labourer." [2]

146. I think the conclusion from the above evidence is, that the main objections which are urged by agriculturists against the universal diffusion of good education are precisely such as ought to induce the State to insist upon it. It raises wages, and removes superabundant population. In Northumberland, where wages are highest, the farmers, says Mr. Henley, "give every possible encouragement to the schools," and, as a consequence, the labourers, being well off, have no motive to desire to leave the country. Why should they go? when it is declared by Mr. M'Cabe, who has been a Union medical officer in Yorkshire and Lincolnshire, and has also been in business in the United States, and now been living in Northumberland a year and a half, that "he has never found working "agricultural labourers so well off in any place, including America; in fact, there are "no poor people at all here." [3]

---

[1] I think it so important to prove that the theory I have put forward of the effect of education in inducing those who profit by it to be dissatisfied with low wages, and so inspire them with a wish to look farther a-field for work, thereby diminishing the population where it is redundant, and consequently low waged, and distributing it where it is wanted, that I add below some extracts from the Reports of the French inspectors of schools, showing that the same effect has been produced in France, as I have noted here. It is well known that in France the town populations are generally opposed to the Imperial despotic *régime*, while the country population support it. Great efforts have lately been made in France to extend and improve primary education, and the effect has been to increase the town populations and decrease the country ones. This result obviously tended to undermine the autocratic power of the Emperor, and in fact has done so, as shown in the late elections; and the Government, suspecting that this was caused by the great diffusion of education, sent a circular to all the French inspectors of schools, inquiring whether the migration of the country population to the towns was really the effect of the cause I have named. I have received the reply of the inspectors to this query from every department of France. They are obviously unwilling to allow that the effect of the diffusion of improved education, of which they justly boast, has really had the effect of transferring country labourers to towns, and so undermining what we should call the unconstitutional authority of the Government, but the admissions are quite sufficient to place it beyond all doubt that such is the result of the spreading of good schools. I give below a few extracts from the Reports of the French inspectors of schools, showing the universality of the principle which I have been endeavouring to maintain in the text of this report.

"La propagation de l'instruction primaire a-t-elle contribué à l'émigration des campagnes vers les villes? Cela a du être et sera encore pour les plus instruits, les plus intelligents, ou les plus ambitieux."—*Seine et Oise.*

"La propagation de l'instruction primaire est une des causes du mouvement qui entraine les habitans des campagnes vers les villes. Quand un enfant sait lire, écrire et compter, ses parens sont prompts à rêver pour lui une autre profession que celle de laboureur, ou, plus tard, cette pensée lui vient à lui-même, et c'est dans la ville qu'il espère trouver une position meilleure."—*Vienne.*

"A une certaine époque, on a pu accuser l'instruction primaire de contribuer à l'émigration des habitans de campagne vers les villes. Dans les circulaires commes dans les conferences, les inspecteurs exhortent les instituteurs à combattre ce courant funeste, qui précipite vers les villes l'élite de la campagne."—*Meurthe.*

"L'émigration des habitans des campagnes vers les villes est un fait incontestable!"—*Eure et Loire.*

"Il y a quelques années, l'enfant qui avait acquis des connaissances plus étendues que celles des autres habitants de son village s'en allait chercher une position qu'il croyait plus brillante que celle de son père; il venait à la ville."—*Meuse.*

Mr. Matthew Arnold, in his Report on France, confirms the above extracts. He says, "Eminent persons "complained to me that already popular education in France was carried so far that society began to be "dislocated by it; that the labourer would no longer stay in his field, nor the artisan in his workshop; that "every labourer would be an artisan, every artisan a clerk. This is the language which we have all heard "so often from those who think that the development of society can be arrested, because a farmer's wife finds "it hard to get a cookmaid. It is sufficient to say to those who hold it, that it is vain for them to expect "that the lower classes will be kind enough to remain ignorant and unbettered merely for the sake of saving "them inconvenience."—*Matthew Arnold on Popular Education in France*, p. 167.

[2] App., p. 19. [3] Henley, p. 57.

Effect of education in Scotland in raising the condition of the population in some of the Hebrides, and reducing the redundant population without any heart-burnings.

147. It seems to me so important to establish this principle, that education is really the only effectual method of raising the wages and general condition of any population, and of removing their redundant numbers, without any difficulty or the opposition and heart-burning that often attend direct modes of interference, that I am induced to refer to Scotland for a remarkable illustration of this truth. The second report of the Commissioners appointed to inquire into Scotch education contains a striking example of the facility with which gigantic evils may be encountered and overcome, if the right method be adopted of working on the intelligence of the inhabitants. The Commissioners remark of the Hebrides :—

" It can scarcely be disputed that the population in the islands far exceeds the numbers of those who can be maintained in comfort from the produce of the district. Various means have from time to time been tried to cure this disease of over-population, but generally without success. The only effectual method is voluntary emigration ; but this cannot be applied except with the co-operation of the people themselves. In other words the people must be taught to appreciate the benefits which may be obtained by leaving their island homes, and must be furnished with means of employing their energies in the country to which they transfer themselves. Effects such as these can only be produced by education. The minds of these islanders must be enlarged, the desire for improving their condition must be stimulated, and the knowledge of the English language, whereby alone that desire can be practically gratified must become general.*

" In confirmation of these views, we think it right to quote part of a letter addressed by Mr. Ramsey to the Lord Advocate, 'On the State of Education in the Outer Hebrides,' in the year 1862 :—

" ' The population of Lewis in 1851 was 19,694, and in 1851, 1852, and 1855, 1,772 were sent to Canada, at Sir James Matheson's expense, but so far was this from arresting the increase that the number, as ascertained by the ceasus in 1861, was 21,059, so that, including emigration, the increase during the ten years was 3,137, or about 16 per cent. When in Barra I received similar information regarding that island. The population of the parish in 1851 was 1,870 : the proprietor, at his own expense, sent away in 1852 upwards of 400 emigrants, but the population in 1861 had again increased, and at the period of the census was 1,859.

" ' In both these cases a considerable outlay was incurred for the purpose of removing what was deemed a superabundant population, but the foregoing details prove that the expenditure has not yielded any return ; nor should it be forgotten that these removals are too frequently carried out amidst the opposition of the people, causing the infliction of much sorrow and suffering upon the poor reluctant emigrants themselves, while the process is one necessarily involving much labour and painful effort on the part of those engaged in carrying it out. My conviction is, that if the same amount of money and the same effort had been expended in wisely encouraging, or in case of need, enforcing the education of the young, the work would have been pleasant and the result satisfactory.

" ' In Lewis, indeed the proprietor for some years past has endeavoured to promote the education of the people, but either from the shortness of the time, or from the absence of cordial co-operation on the part of those who are resident, and locally interested in their welfare, or other causes, the work does not appear to have been carried out yet with sufficient persistence and energy to insure any adequate measure of success. In Barra I could not ascertain that the proprietor has ever done anything in the way of encouraging education, and in both cases the schools have as yet done so little, that the Gaelic language alone is understood by the great majority. The Island of Islay, I am informed, was in a similar condition not long ago. One of the small tenants, or a working man, who could then speak English, was pointed out to the stranger as an example of progress in his class. The late Mr. Campbell, of Islay, and his uncle, the late Captain Walter Campbell, of Sunderland, possibly without foreseeing all the results, but from their well-known benevolent desire to promote the welfare of every individual on their estates, took an active interest nearly 40 years since in establishing efficient schools throughout the island, and in encouraging the regular attendance of the young. This has been acted on and encouraged by those who have succeeded them, as well as by clergymen and other residents who have taken an interest in the subject. And the result has been, that although there have been few enforced removals during that period, and no outlay has ever been incurred by the proprietors to promote emigration, the diffusion of education has not only arrested the increase of the population, but has so promoted voluntary removals as to bring about a great diminution of their number.

" ' The population of Islay, which in 1841, in round numbers, was 14,000, decreased to 12,000 in 1851, and according to the last census was only 10,000 in 1861, while there has been a corresponding decrease in the number of the very small holdings of land.

* The same opinions are enforced in "Periodical Destitution in the Highlands, and its Remedy," by John Ramsay, Esq., Islay, 1863, and in Mr. Nicolson's Report, pp. 124–126.

Effect of education in the Scilly isles in raising the population from the extreme of misery to high prosperity.

148. I will give an exactly similar instance, which was accompanied by still more striking results, from the extreme south of England, the Scilly Isles, where the population having been in the extremest misery, after all the ordinary devices for improving them had failed, have been raised to the highest prosperity by the process of education. I give the details of this remarkable experiment in a note below.[2]

---

[1] Second Report of Commissioners on Scotch Education, p. 170.

[2] Forty years ago the islands of Scilly were in the state of the severest misery and destitution, and the continual objects of charitable appeals for relief, which in one instance produced the large sum of 20,000*l*. The following is an extract from a Report of a Committee appointed to inquire into their condition. " Nothing can exceed the wretchedness and misery to which the unhappy islanders of Scilly have been

149. I should observe that the schools must be good ones, or the excellent results I have been describing will not flow from them. Geography, for instance, must be taught in them, as judging from my experience as a school inspector, I believe few subjects have a more powerful influence in enlarging a pupil's views. With it he is better enabled to

Necessity of teaching geography in schools.

" subjected within the last two years. By far the greater proportion of extreme suffering has fallen on the " females of those islands amongst the poorest classes. Doomed by a mysterious Providence to privations the " most extraordinary, and incapable of obtaining that kind of employment most suited to their sex, they have " dragged on a life of sorrow and anguish the most poignant and the most alarming. Widows have sighed " in vain for relief; orphans have bewailed their lot in gloomy solitude; aged and decrepit women have " beheld with horror the approach of increasing infirmity without the commonest necessaries of life to sustain " their declining years. And mothers have travailed again with sorrow and agony over their wretched " offspring; while children have pined away in artless woe and unavailing complaints, stricken with death " for want of bread."

The numerous Committees that were successively formed to alleviate the distress adopted the usual schemes for finding work for the inhabitants. The women were to be taught to spin and knit, to plait straw, and make line twine. The raw material was purchased for these manufactures, and "measures adopted to " find a market in all directions for the goods manufactured; and suitable rewards were to be distributed " annually to the most industrious, cleanly, and frugal persons." All the apparatus necessary for fishing mackarel and pilchards, which abounded in the surrounding seas, were procured at an expense of 8,000*l.* In a word, all the ordinary popular devices for raising a starving population were set on foot, and ended in failure. The large subscription of 20,000*l.* seems indeed to have produced absolute injury. It attracted back to the islands many Scillonians who were in employment elsewhere with the hope of sharing in this large sum, which was finally all spent without leaving a trace behind.

In the year 1834 the islands were leased to the present lessee, Mr. Augustus Smith, who appears to have discovered at once the real cause of the misery of the inhabitants, and to have applied the appropriate remedy.

One of the chief evils was the cottier system, under which each family was settled on a small portion of land, that was often scattered in minute fragments over the islands, and on the death of the father each little farm was re-divided equally among his children. This system had introduced a pauperized population, which was continually increasing from this subdivision of land, and mainly dependant for subsistence on the produce of these minute farms. These small holdings were consolidated, one of each family alone was permitted to take the farm, and the younger children were told that they must make their way in the world, either by going to sea, entering service, or learning some trade. But that they might be well qualified for their future callings, Mr. Smith's next care was to provide a thorough useful course of education. Schools had previously existed in the islands, and considerable sums been expended in their support, but owing to the inefficiency of the teachers, the want of all necessary appliances, and the absence of all regular inspection, these establishments were wholly inoperative as to producing any real benefits. The proprietor founded good schools in each island, appointed efficient teachers, stimulated their efforts by continual inspection, and obliged the inhabitants to send their children to them, by making them pay school fees for each child of an age to go to school, whether they sent their children or not.

In these schools, besides the elementary subjects of education, history, geography, and the rudiments of navigation, were taught, with a view of preparing the youthful population for what seemed their most fitting career—a sea-faring life. This last improvement—the good schools, was the real lever which succeeded in raising the population out of their low condition.

Ten years after the introduction of these improvements I visited the islands, and so can speak from personal examination of the result. The success was nothing short of marvellous. The chronic misery which used to cause yearly applications for public subscriptions had absolutely ceased. I never met with a better dressed population, nor one showing in their cottages and deportment clearer signs of comfort and refinement. I inspected all the schools, and found the children well instructed. I was particularly struck with a discovery I made on the island in which the proprietor resided, that one in five of the population was at school. This considerably exceeds the Prussian proportion of one in 6·21. An observation of the chief clergyman was still more striking, as he stated to me that he had a difficulty in finding persons willing to receive the sacrament money. Contrast this with the Report above quoted, "that nothing could exceed the wretchedness and " misery of the islanders." Drunkenness had been the characteristic of the population, yet now it was almost unknown, and the inhabitants of one island had forsworn spirituous liquors altogether.

The potatoe famine tried the islanders rather severely, as one of their most profitable occupations was growing potatoes for the supply of shipping. The London market, though tried, had failed altogether; and it was not till some years after the famine that the islanders, who planted earlier and earlier every year, as more likely to secure a good crop for their own supply, at last discovered they could compete with Penzance in the London market. The neighbouring county of Cornwall suffered greatly from this cause. Yet so far from Scilly sending forth the old cry for assistance, subscriptions were sent to relieve the suffering Cornishmen.

The proprietor allowed one son in each farm to succeed his father on death. But the people soon found out that small farming was a very unprofitable work, and so the children voluntarily took to ploughing the sea instead of the land; while the excellent training the boys received in the schools caused them to be in demand by the Liverpool and London ship-owners.

The conduct of these youths was so good, and their intelligence, owing to their superior education, so marked, that even before their time of apprenticeship was expired they were frequently promoted to be mates and stewards; and on a late visit to the islands, I ascertained the remarkable fact, that of all the boys who had gone to sea, not one, when grown up, had remained before the mast, but had all become masters or captains of vessels; and at this moment, many boys whom I had examined in the schools are captains of large ships sailing from Liverpool and London.

Now I wish to make a special remark on the methods adopted to bring about this great change. The proprietor did not, as before, resort to the plan of setting the women to spin and knit, and promise to buy all they produced. He did not supply the men with nets, and tell them to go and catch the fish that abounded around them. He even adopted some plans that on first sight might have appeared harsh. The inhabitants had been in the habit of cutting turf for fuel, and this he positively prohibited as destructive to the surface, but

appreciate the advantages of migration and emigration. A child, who can simply read and write, ordinarily knows no other lot open to him than that in which he was born, and the horizon of the village is his world.

150. On this subject I am tempted to relate an anecdote that occurred within my own knowledge. A gentleman, about to emigrate to New Zealand, asked me if I could send him an orphan boy from some workhouse school as a servant, and he especially desired that the boy should have been taught baking. I happened to know only one school where baking was taught, and I accordingly went to it, explained what I wanted to the first class, and the advantages which would probably be derived by a transference from the low condition, which was their only prospect if they remained in England, to the high-waged country at our antipodes. Not a boy would accept the offer. I then explained to the gentleman that I could not get him a baking boy, but that I could send him a boy of developed intelligence from a good school, who, though he would not know baking, would be found able by his superior education to turn his hand to anything, and thus be much more generally useful. He accepted my offer, and I then went to a good school in the Isle of Thanet, where I knew the children were well instructed in geography (none was taught in the other school), and made a similar offer as before to the first class, desiring any boy who wished to accept it to hold up his hand. Every hand was instantly raised. They were well acquainted with the British colonies. I selected a boy who answered perfectly well, and is now married and a prosperous colonist in New Zealand.

151. I believe the above to be a typical instance. The education of pauper children is now, as has been quoted above from the evidence, and no one is better acquainted with its character than myself, very superior to what is commonly imparted in village schools. And the result is, as I have reason to know from the large opportunities of inquiry I possess, that it is very rare for a boy brought up in a good pauper school to go to farm work. Or, if on being taken out of the school they are first put to farm work, they either quickly get to the best paid work on the farm, owing to their superior education, or transfer themselves to better places elsewhere. Many of them go on the railways, where the lowest wages are 17*s.* a week, or become telegraph clerks or shop boys, and so often rise to very high positions.

152. It is well known that the first effect of the Revised Code was to expel all the higher subjects of instruction from inspected schools. By a Minute issued by the Committee of Council on Education on 20th February 1867, this evil was partly remedied by offering increased grants to any school in which an examination in one secular subject, geography, grammar, or history, was passed by one-fifth of the pupils in average attendance. By the last Report of the Committee of Council it appears that 9,073 schools or departments of schools were examined last year under this Minute; but only 2,614 schools, or 28·8 per cent of those examined, succeeded in obtaining the grant; the whole sum thus expended amounting only to 13,235*l.*[1] I mention this fact to show how backward we are in this country in promoting education sufficient to produce the good effects I have been detailing, as undoubtedly the inspected schools are the best schools in England, and what they offer may be considered as the best education

---

took care at the same time that coals should be imported, and on sale at a cheap rate in the chief town. He was bound by his lease to make some improvements in the chief harbour, and the employment thus created assisted the proprietor in meeting the first difficulty, but no employment was given simply for the sake of employment. No overpaid work was offered; no doles of relief were given; no subscriptions solicited; no one was forced or bribed to emigrate; in a word, every measure adopted tended to dispauperise and induce self-reliance, and was a complete reversal of the patronizing petting system previously tried. The real lever was found by raising the intelligence of the population, pointing out the way to self-support, and then leaving them to shift for themselves.

The result was perfect success. Of course in ten years the old pauper spirit could not be completely eradicated, but the pauperism was then smaller than I believe any place in England. It amounted in money to 8*d.* per head on the population, while in Kent and Sussex 15*s.* per head was a common sum. I found, for instance, that on one island, containing a population of 214, the sole pauper was an old woman who was paid 9*d.* weekly.

The increase that followed in the shipping interest of the islands was remarkable.

In 1830 the Port of Scilly had above 50 tons,	5	vessels	giving	406	tonnage.
In 1842 „ „	37	„	„	3,715	„
In 1844 „ „	38	„	„	4,120	„
In 1869 „ „	28	„	„	6,177	„

It has often been observed that the effect of good schooling on a low-waged population is to diminish their numbers, and this result took place here. The increased intelligence of the population enabled them to look farther afield for employment, and resort to more profitable occupations than were open to them within the confined area of Scilly. Thus it has been found necessary to import labourers to do the agricultural work of the islands.

[1] Report of Committee of Council on Education, 1868–69, p. 37.

open to the labouring classes. And it may further stimulate our efforts in this direction to mention what has been done by the French Government, who would almost appear to have been watching our progress in England. The Minute above mentioned, which thus succeeded in causing perhaps one secular subject beyond reading, writing, and arithmetic to be effectually taught in 2,614 schools out of the 13,442 schools inspected, was passed on the 20th February 1867. Two months later in France, by a law passed on the 10th April 1867, the teaching of geography and history was made obligatory on *every* primary school in France. The contrast is not flattering to our national pride, especially as France has long been considered one of the most backward countries in Europe in the matter of education.

Comparison between the minute of Committee of Council of 20 Feb. 1867 and the French decree on the same subject on 10 April 1867.

153. It has been my object in the recommendations I have made to carry out, as near as possible, the 6th, 7th, 8th, and 9th recommendations of the Newcastle Commissioners of 1861. These are the following:—

Object of the recommendations in this Report to carry out the proposals of the Newcastle Commissioners of Education in 1861.

"6th. That, under the present circumstances of society, a satisfactory point will have been reached when children go to the infant school at the age of 3, and from the infant school to the day (juvenile) school at the age of 6 or 7, and remain in the day school till 10, 11, or 12, according to the circumstances of the parents, and the calling to which they are destined; provided that they attend, while on the school books, not less than four hours a day for five days in the week, and not less than 30 weeks, ranging under the most favourable circumstances up to 44 weeks in the year.

"7th. That there is nothing in the feelings of the parents on the subject of education to prevent well directed efforts to ensure this amount of attendance from meeting with general success.

"8th. That special efforts should at the same time be made by means of evening schools to keep up the education once received, to which the encouragement of free and lending libraries would form a valuable auxiliary.

"9th. That much time may also be redeemed for educational purposes from the years of childhood now neglected, by preparing the children for the day (juvenile) schools in good infant schools."[1]

154. Thus my final answer to the question proposed in this Commission as to what extent and with what modifications the principles of the Factory Acts can be adapted for the regulation of the employment of children, young persons, and women in agriculture is that none of them are applicable, except the single one as to the prohibition of children from working under a certain age, which age should be 9 immediately, and 10 at some period not exceeding two years from the passing of the Act, and that this prohibition should apply to every child in the kingdom. And at the same time that some legislative measure establishing efficient schools universally should be passed, and that without this latter measure, the former regarding age ought not to be passed.

Final answer to the questions proposed to this Commission.

155. It is beyond the scope of this Commission to suggest the details of any plan for universal education.

All this I humbly certify to Your Majesty.

Given under my hand and seal this 22nd day of October 1869.

EDWARD CARLETON TUFNELL.

2, Victoria Street, Westminster.

General remarks.
Suggestions for improving.
Encouragement to building by Government loans.
Necessity for independent inspection.
Best situation for cottages.
Control of cottages.
Lodging of farm lads.
Allotments.
Allotments of land for a cow.

(D.) Other circumstances affecting the condition of the agricultural labourer - - - 180–211

Part payment in beer or cider.
„ kind.
Irregular payment.
Diet.
Beerhouses.
Statute fairs.
Yearly hiring.
Want of independence.
Benefit clubs.
Combination in the nature of trades unions.
Conclusion.

To Her Majesty's Commissioners.

Gentlemen,

1. This report, with an appendix of evidence, relates to the counties of Dorset, Kent, Chester, Salop, Stafford, and Rutland (together with one farm in Sussex), all of which, in accordance with your instructions, I visited during 1868–9. G.

2. The mode of inquiry adopted by me varied to some extent in every county; but my general rule was to select in each, two or more districts to be visited in detail, within which I went to every parish, giving previous notice of my coming, and in many cases asking for a small meeting. But in addition to this, I visited for special inquiry many separate parishes and estates; I held conferences with six chambers of agriculture, and several boards of guardians, and attended many other meetings of every description. I sent out between 70 and 80 of the printed circulars with which I was furnished, and communicated also by letter on any point requiring particular consideration with many gentlemen in all parts of these counties. From these materials I have compiled the following report, although I have referred also, where necessary, to the experience acquired last year in the prosecution of the same inquiry in the counties of Lincoln, Nottingham, and Leicester.

DORSETSHIRE.

3. In the county of Dorset I visited 42 parishes (containing a population of 37,000, and an acreage of 135,000), situated in various parts. The central district of the county on the chalk range of hills stretching through it from east to west, has been to a great extent brought into cultivation in recent years, is occupied in large farms, and, though considerable effort has been made, the labourer is in some cases living at a long distance from his work. Yearly hiring, and the system of letting cottages with the farms are common, one result of which has been the mode of hiring whole families presently to be noticed. Districts visited.

To the north of this range of hills lies the vale of Blackmoor, which is occupied in small farms, and is almost entirely laid down in grass. In some cases the occupiers of these farms cultivate them with the help of their families, and require little (if any) hired labour. The population is in consequence less well off than in the district just described, for the wages are lower, there is very little piece-work to do, and many men are thrown out of work in winter. Throughout the vale, and in some other parts of the county, as in the neighbourhood of Blandford, the manufacture of gloves is carried on to a

G. considerable extent by the families of the agricultural labourers. It is a very unremunerative work, and can only be made to pay by long hours of very hard work, and, like most other domestic duties of this description, it involves the younger members of the family being kept at home from a very early age, being put to work as soon as they can hold a needle, and being afterwards kept away from service.

To the south of the chalk hills is a large tract of heath. The mode of reclaiming this has often been to let a piece of land to a labourer on a lease for lives, with permission to build upon it. The result has been the erection of a large number of miserable cottages, occupied by these life owners, and never repaired. The population exceeds the wants of the district, and a large number of the men work on the farms only in the summer, and go to the woods or do any sort of work that they can get for a living in the winter. Many of them go long distances to work. An exceptional district is comprised in the peninsula of the isle of Purbeck, where many other occupations, such as clay and stone-cutting, enter into competition with agriculture, and raise the value of labour to a considerable extent.

System of hiring whole families.

4. One of the especial characteristics of this county is the system of hiring whole families. When a labourer is engaged by the year, the size of his family, and the vigour of his wife and sons,* becomes an important element for consideration, as they are expected to go out to work when required. If the wife cannot go, she must send a daughter or (as I found in at least one parish) she must provide a substitute. This arrangement is clearly a bad one for the labourer and his family. It forces his wife to work, it causes his growing sons, and sometimes his daughters, to be kept at home in an overcrowded cottage. The boys go to work at a very early age, not only because they are required by the farmer, but also because their employment being virtually treated as part of the father's remuneration, he becomes only too anxious to derive profit from their labour. As they grow up they continue to lodge at home, and though they gradually get to do the work of an adult man, they are frequently receiving two or three shillings a week below the ordinary wages of a man. (Evid. 68, 72). Or, if they prefer to go elsewhere, the father is discharged by his employer because his "family is not large "enough." (Evid. 64).

Employment of women.

5. Throughout the county, except where gloving is a constant source of occupation at home, women are largely employed in the fields. In the neighbourhood of Dorchester especially, they work as much as I have seen them do in Lincolnshire, which is partly due to the mode of hiring above mentioned. Young girls go little in most parishes, except in hay-time and harvest. A good deal of the work done by women is in winter, among the turnips, on the threshing machines, or in the barns. Their wages are very low (except when with threshing machines), and vary from 6*d.* to 8*d.* a day, the latter wage being sometimes paid only when fewer "perquisites" are given to the husband. (Evid. 67 B.).

Employment of boys excessive.

6. Boys are taken to work by farmers at a very early age, for some go at 6 or even younger. One boy, the son of a shepherd, "is regularly with his father in all weathers and has been so all the winter; he "will not be 6 till next August." "Out of 17 sons of labourers, all but one had gone to regular work "between 6 and 9." (Evid. 18). "Out of 76 children in one school, only 12 labourers' sons were "over 6, and only three out of these were 8 years of age." (Evid. 26). At Marnhull "a good many "go at 6 and 7." (Evid. 48). At Holwell they "cannot keep any boys in the school after 7; they "go out as carter boys." (Evid. 50). At the Wareham agricultural meeting, two prizes for long "servitude" were given to boys who must have begun regular work with horses on the farm at 6 years of age. (Evid. 74). In fact, to speak generally, the proportion of boy labour regularly employed upon farms is larger than in any county visited by me, even in the fens. (Evid. 3). Boy labour has partly displaced that of men, and on this ground alone some restriction as to the age of continuous employment would be of great value.

7. But other causes, besides employment on the farms, take boys away from school at an early age. The lowness of the wages makes every labourer anxious to send his children out, although near Dorchester this is certainly surpassed by the eagerness of the farmer to get them. Again, the system of allotments prevails here, probably to as great an extent as in any county in England, and to most cottages ample gardens are attached. On the whole, therefore, the labourer (who sometimes also gets a piece of potato ground on the farm) occupies an unusually large amount of land, and on this occupation can be found for all his family. Says Richard, in the words of the Dorsetshire poet—

"What wi' dungèn, diggèn up, an' zeedèn,
A thinnèn, cleänèn, howèn up, an weedèn,
I, an' the biggest o' the childern too,
Do always vind some useful jobs to do."

and John answers—

"Aye, wi' a bit o' ground, if woone got any,
Woone's bwoys can soon get out an' eärn a penny,
An' then by workèn, they do learn the vaster,
The way to do things when they get a meäster."

Earnings of Dorset labourers.

8. In spite of this advantage the earnings of a labourer in Dorsetshire are less, and present a greater variety,† than in any county visited by me; and yet the amount is difficult to ascertain,

---

* The following advertisements are from the Dorchester County Chronicle.
(1.) Wanted, a farm labourer, with a working family; apply to Mr. G. Tett, Chiselborne.
(2.) Wanted, a shepherd, with a grown-up son or two; apply to Mr. G. A. Ingram, Bagber.
(3.) Wanted at Lady-day, a thatcher, with two or three boys from 9 to 14 years of age; apply to Mr. G. Mayo, Puddlehinton.

† As an illustration of this variety, I append the wages of five large farmers, as stated by themselves:—
A. (Cerne Abbas); gives 8*s.*, a cottage and garden rent-free; some potato ground, some furze to burn, and 'grist' corn when he has it. Beer at piece-work.
B. (Marnhull); gives 9*s.* and three pints of cider a day during the summer. No other extras.
C. (St. Giles'); gives 10*s.*, no cottage; 12 'lug' (perch) of potato ground to some men; beer at piece-work.
D. (Winfrith); gives 7*s.*, cottage and garden rent-free, 20 'lug' of potato gronnd, pays the carriage of turf for fuel, and gives corn at market price. [In the parishes where C. and D. live, work ceases at 5 p.m.]
E. (Whitchurch); gives 9*s.*, cottage and garden rent-free to 3 out of 8 men, 15 'lug' of potato ground, and gristing at 5*s.* to all, some fuel to two. Beer at piece-work (average sum earned at piece-work, 2*l.* 12*s.*)

because the wages are paid partly in money and partly in kind. This mode of payment is described as "a low weekly wage supplemented and eked out at various times by perquisites and allowances in "coin or material, or opportunities of piece-work." G.

9. Omitting for the present all mention of carters, shepherds, or specially skilled men, the weekly wage for an ordinary labourer is generally 8*s.* with, or 9*s.* without, a cottage free of rent. Let us see what is added by perquisites and allowances, and opportunities of piece-work.

10. In the vale of Blackmoor the only addition usually made to the money wage is a certain quantity of beer or cider, given more or less regularly. In other parts they sometimes include in addition "grist corn," that is, "tailing" or second wheat, which some labourers are allowed to buy either below or at the market rate, a certain number of perches of ground for a potato crop, ploughed and manured by the farmer, the cost of the carriage of fuel and sometimes the fuel itself, whether wood, furze, peat, or coal, and a cottage rent-free.* It must in the first place be understood that these perquisites are given only to *married* men, that few (if any) farmers give all of them, and that in all cases they vary so much in amount, in quality, or in the times of year in which they are given, that it is impossible to lay down any general rule for estimating their value.

11. But the great objection to the system is its liability to abuse. That in many instances it is abused, it is impossible to deny. No doubt good employers, who give the full value of all these advantages, and who keep their agreement in the spirit as well as in the letter, may by this means add an average of 2*s.* or 3*s.* a week to their labourers' earnings. But on the other hand some farmers give none of these advantages, others give one or two only. Or again, the wheat may be, as it sometimes is, of the most inferior character, the "fuel" may consist of the commonest gorse, the cottage may be miserable and overcrowded, or extra labour (on Sundays or at harvest) may be required, either of the man or his family, in return for these advantages. In all of these cases it is clear that the addition to the money wages of the labourer may be very small; and the inferior employer, sheltering himself under a system which in good hands works very much to the advantage of the labourer, can by means of it screw his men to the greatest possible extent.

12. The opportunities for piece-work are not so great as in many other counties. In the vale of Blackmoor hardly any is done, in other parts ordinary men get it, as a rule, only at haytime and harvest, and many farmers, instead of giving it at all to regular men, substitute a fixed payment, varying from 10*s.* to 2*l.* This, it must be remembered, is earned at a cost of many extra hours of work, often amounting to an addition of two days to the week, and allowance must be made also for the greater amount of food and drink consumed, and for the wear and tear of tools. The difficulty of laying down any fixed estimate on this subject is shown by one of the tables in the Appendix (Evid. 68), where the earnings of 12 ordinary labourers at piece-work varied from the fixed payment of 1*l.* for harvest to 3*l.*, which was obtained by specially skilled men.

13. Difficult as these additions are to estimate, I think it may safely be said that the ordinary labourer in this county earns on the average (piece-work and everything included) from 10*s.* to 11*s.* a week. Carters and shepherds, who work longer hours, and to whom therefore some additional advantages are always given, would often receive from 2*s.* to 3*s.* a week more.

14. To the "perquisite" system as above described there is another very strong objection to be made. The general time of payment is once a fortnight, in many cases once a month, and in some at irregular intervals. The result of this is that very little money passes between the master and his man. Deductions are made for the "grist corn," and often for cheese and butter, for skimmed milk, for barley for the pig, or for the pig itself, so that the actual money earned never passes between the employer and the employed, but the balance only which remains (if any) is handed over to the labourer. The result is that "48 hours after the labourer has taken his wages he has seldom a shilling left." (Evid. 72).

15. The rent of the cottages on some estates is very low. Lords Portman and Shaftesbury, for instance, let all their's at 1*s.* a week including a garden; so do many other landowners. Lord Westminster, who always adds an exceptional amount of land, charges 5*l.* a year, and round Dorchester few cottages are to be obtained at a less rate. Indeed many of the farmers in that district, who include a cottage in their wages, estimate its value at 2*s.* a week. In Fordington and similar open villages 2*s.* 6*d.* is no uncommon price. On the whole, however, taking the ample gardens into consideration, the cottage rents are usually below the average of other counties. Cottage rents.

16. The redeeming feature of rural life here is the amount of land held by the labouring class; indeed but for this the wages would sometimes hardly be sufficient to support life. The gardens are large, many regular labourers have a bit of potato land ploughed and manured for them, and allotments are very common. A reference to the tables appended to this Report (Evid. 65) will show that these are not always cheaply let, and that a good many are bringing in a profit of 4*l.* an acre to their Gardens and allotments.

* The following observations may give some assistance in arriving at an approximate idea of the value of the various "perquisites."

(1). 'Grist' corn is sold to labourers either at a fixed price per bushel—now generally 5*s.*—or at the market rate. Some few farmers allow them to buy as much as they like, more generally it is offered to them only to a limited extent, or during a part of the year. It is clear that this may be a gain or a loss according as the price of corn is low or high, or the quality of the wheat is good or bad. In many cases it is an undoubted gain; in bad hands it may be and is sometimes a loss; and in the neighbourhood of Dorchester, the possible gain is often counterbalanced by the reduced pay given to the wife for her work, that is, she will get 8*d.* a day and no 'grist,' or 6*d.* with it. One great hardship entailed by this system is that the corn has to pass through the miller's hands for grinding, and part of it is kept back as a toll. It is even complained in some cases that the wheat from inferior corn is substituted for that sent to the mill.

Potato ground is a piece of land upon a farm, given (generally in Dorset) free from rent, and ploughed and manured by the farmer. If these conditions are complied with, it is fairly estimated at 1*s.* per year for every 'lug' or perch. Each labourer has from 15 to 40 perch, or in some cases, a quantity proportioned to the size of his family. Where allotments are common, as on Lord Shaftesbury's estate, potato ground is very rarely given to ordinary labourers.

Fuel.—Some few masters give a ton of coal at Christmas; many more give furze or peat, according to the locality, or send a waggon to fetch it. No two masters, however, observe the same rule in this respect.

Beer or cider is generally given, as in many other counties, at task-work. In my opinion it cannot be reckoned, any more than it is in those counties, as a part of wages, because it does not go to the benefit of the family. Some give it all the year. This practice, I am glad to say, is diminishing. It has been much discountenanced by many landowners, and especially by Lord Shaftesbury; and money payments have been substituted for it. The value of this addition depends on the quality of the liquor, which is often very bad. In the case of cider it is generally grown upon the premises, and costs little or nothing to the employer.

G.

owners, and cannot, therefore, be described as any favour granted to the peasant. In the union of Bridport the *average* rent of land let in allotments is as high as 6 guineas.* Some landowners on the contrary have been very careful to avoid this. On Lord Shaftesbury's estate alone, there are 396 allotment gardens, of which the common rent amounts to a rate of 24*s.* per acre, and no less than 165 of them are half an acre in extent.

Cottages.

17. "For some years the cottages of Dorset were a byeword and reproach * * * * * *. It "is pleasant to look back upon the serious charges then advanced against them, because it places in "strong and gratifying contrast their present condition."† "There has been," says Lord S. G. Osborne, "in the 27 years I have known Dorset, the greatest improvement" (Evid. 4). Where many have improved, it is invidious to mention names. Following the lead of Mr. Sturt at Crichell, the great majority of landowners have effected great changes on their estates. The improvement in public opinion on this subject is no doubt in a great degree due to the exertion of Lord Sidney Godolphin Osborne, to whose most valuable paper in the Appendix (Evid. 4) it is unnecessary for me to call your particular attention.

18. In spite of these changes, the cottages of this county are more ruinous and contain worse accommodation than those in any other county I have visited, except Shropshire; and it must be remembered that the system of hiring adopted here would especially seem to require a sufficiency of bedroom accommodation. The estate of Lord Rivers, having been long held by life tenants, is notorious for its bad cottages. And such villages as Bere Regis, Fordington, Winfrith, Cranbourne, or Charminster (in which there is an average of 7 persons to a house), together with others described in the evidence, are a disgrace to the owners of the land, and contain many cottages unfit for human habitation. Nor can this condemnation be confined to large open villages. The parish of Batcombe for instance (with an acreage of 1,109) has within its limits 23 cottages occupied by agricultural labourers, of which 11 have one bedroom only, and in five of these families with three or more children are sleeping (Evid. 59). In the 42 parishes comprised within the unions of Cerne and Wimborne, no less than 314, or (16 per cent.) of the cottages had one bedroom only, and 113 of these contained a family with three or more children (Evid. 59). What is called a second bedroom is often too a mere apology for it, and is sometimes described as "a closet not closed" from the bedroom. One special difficulty in the way of improvement in this county should, however, be mentioned. It is the number of cottages let on lease for lives, and until these fall in, the landlord has no control, and no power of effecting such improvement. It is to be regretted that some are still being let on these terms.

Sanitary state of village.

19. There is one circumstance connected with these villages which renders them more especially open to reproach, that is, the neglect of the most obvious sanitary precautions. In village after village the answer was "there is nothing like one privy to every cottage." I saw whole rows of cottages with none, and abounding with nuisances of all kinds. Remonstrance is generally disregarded, and the state of filth, in which many parishes are left, calls aloud for some active interference to relieve the present authorities of a responsibility they have grossly neglected.

Education.

20. In respect of education, this county appears to me to have made considerable exertion. The smallness of many parishes has rendered it difficult for them to procure a master, and therefore the school, which now exists in almost every parish, is generally taught by a mistress. From what I have already said it will be seen that these schools have great difficulties to contend with, owing to early labour, and to the scanty resources of the families. Education, therefore, is very insufficient, but I noticed with pleasure the great desire for instruction which prevailed among the labouring poor in this county, one proof of which may be found in the fact that the proportion of parishes with night-schools is very unusually large (Evid. 3). Farmers in this county are especially suspicious of education, because it is found in practice that the low wages drive away almost all the young men who are sufficiently well educated to go. A striking instance of this is given by Lord Sidney G. Osborne in his memorandum relating to children educated at Durweston (in which parish the day-school is not of any pretension, but a night-school has been most energetically worked) during the last 24 years. Out of 187 children thus traced, 129 are accounted for as having left the parish, and 24, besides four whole families have emigrated (Evid. 57).

21. The great need of education in this county is some check upon the *continuous* employment of children at an early age. In the case of girls, "gloving" is mainly responsible; in that of boys, as I have already said, it is field-work. Many cease to obtain any effective instruction whatever after 7 or 8 years of age, and in some parishes it is the maximum age to which they can be kept at school.

KENT.

District visited.

22. In the county of Kent I visited 49 parishes in detail (containing a population of 66,000, and an acreage of 160,000), besides others where my only inquiry was as to the condition of the hop-pickers. The nominal wages vary from 15*s.* in the east and centre of the county, to 12*s.* in the clay districts bordering upon Sussex; but the result of hop cultivation is to cause many men who obtain these wages in summer to be thrown out of employment in winter, and the addition to be made to these sums in order to form a true estimate of the condition of the agricultural population depends mainly on the fact of the district being suited for the growth of hops or not.

* From 45 parishes where allotments are let I have a return also of the rent paid. The following table shows that at least half are let at a very high rate.

Let under 2*l.* per acre.	2*l.* and under 3*l.*	3*l.* and under 4*l.*	4*l.* and under 5*l.*	5*l.* and over.
71 acres.	133 acres.	54 acres.	93 acres.	68 acres.

† Journal of Royal Agricultural Society, xv., p. 441.

G.

1. Hop-growing parishes.

23. The cultivation of the hop being essentially of a garden character, regular men are employed in the hop gardens during a great part of the year at piece-work, and it is no exaggeration to say that 3*s.* a week is often added to their earnings by this means, especially as on some descriptions of work a wife or a child can render some assistance. But in addition to this, there is a great deal of piece-work "easy and suited to females" (Evid. 81), which brings in a considerable addition to the husbands' earnings. "Tying" hops is an instance of this, where a woman contracts to tie the hops to the poles as they grow up at a certain price (13*s.* or 14*s.*) per acre; this lasts during May and June, and it is not uncommon for a woman, with a child or two, to tie as much as three acres. Then again at the hop-picking season every child that can walk is wanted; and it is estimated that every one over 12 years of age can earn on the average from 1*s.* 6*d.* to 2*s.* 6*d.* per day for a period of three weeks. In winter also there is a good deal of work, especially for the elder women, at making hop pockets, shaving poles, and in chopping up rags for manure, so that, in hop-growing parishes, almost any woman can work (if she will) during a considerable part of the year. At East Farleigh it is calculated that 70 per cent. of the able-bodied women work in the fields; but here, as elsewhere in the neighbourhood of Maidstone, the fruit gardens afford additional employment for two or three weeks in the year.

24. So great is the demand for such labour that some farmers make it a condition of hiring the husband, that the wife and children shall work when required, or at any rate at hop-picking (Evid. 84, 97). In other cases gleaning is made the inducement, and none are allowed to glean who have not helped their husband's employer at busy times (Evid. 125). Girls are very rarely employed directly by the farmer, but it will be seen that this district gives so much opportunity for family work, that the school attendance of very young children is terribly interrupted by their being wanted by their parents, either for the occupations above mentioned, or to collect blackberries and acorns in the lanes, which a summer such as that of 1868 causes to be more common than usual. For work on the farms, however, with the exception of hop-picking, their mothers rarely take them before 11, and in most instances not until a later age.

2. Parishes where hops are not grown.

25. In the parishes on the other hand, in which no hops or fruit are grown, the employment of the women is irregular and uncertain. Some farmers employ them in winter among the turnips, but as a general rule they work only in the summer at the ordinary occupations of hay-making and harvesting, and at pulling up the weeds, or couch grass; and therefore their total earnings in the fields would rarely reach a large amount. In these parishes also, men get piece-work only at the ordinary times, and a system not uncommon in this county appears to me to detract very much from the advantage generally afforded by this mode of employment. It is of the very essence of "piece" work that the price should be fixed beforehand, and that a man should know for what he is working. I found, however, in many cases that this is not done, and that the labourer trusts to his employer to fix a fair price after the work is finished.

Employment of boys.

26. Many boys, especially in hop-growing districts, are employed by their parents at occasional work from the age of infancy; but even by farmers they are taken for occasional bird-tending as young as 7 or 8, and very few ever ask the ages of the boys they employ. The employment for such children varies from two to four or five (Evid. 128), or even seven months in the year (Evid. 117). It is rare, however, for them to be continuously employed before 11, unless the waggoner likes to take his own boy to help him, at a younger age.

"Mates."

27. As soon as a boy becomes a "mate" (waggoner's lad), almost all opportunity of self-improvement is gone. "A boy works from 6 a.m. till 8 or 9 p.m., and is entirely under the control of the waggoner, "almost invariably an utterly ignorant man. Very few farmers will interfere to make it possible for "the mate to go to a night school" (Evid. 84), if he would; but no great disposition seems to be shown to do so. "Often the hours for feeding horses are so arranged that it is quite impossible for the lads to "get away to either school or church (Evid. 84)." Even if the boy is inclined to help himself, there is "often no fire and no light" for him (Evid. 111). Under these circumstances it is no wonder that the lads degenerate into louts, and forget all their previous book learning. It has always seemed to me, however, that one effect of the solitary life which these lads are obliged to lead, is that such lads become dull of hearing, and utterly incapable of doing themselves justice when spoken to, but are not really as ignorant as they would appear at first sight. Still, at one large night school at Yalding, "the "greater part have forgotten how to read, except with considerable effort, and it is hopeless to "expect them to explain words" (Evid. 94). So at Sandhurst, the Rev. G. Ridout says, "some who "were fair scholars before, had almost entirely lost it" (Evid. 128).

Education.

28. This rapid forgetfulness was the chief complaint, and appears to me to be the main characteristic of the present system of employing waggoners' "mates" in Kent. Schools are universal, and probably no county in England has a larger proportion of good ones. "For such a district as mine," says Her Majesty's Inspector of Schools in 1868, "I do not think it would be necessary to take "seriously into account the possible case of there being no school *within reach*" (Evid. 79). In this opinion the Rev. B. F. Smith, Diocesan Inspector of Schools, in his report for 1869, expresses his entire concurrence.* Nor was there much complaint of the entire non-attendance of children, although their constant employment in the fields causes great irregularity. At 10 years of age, on the average, in the case of good schools, almost all the boys of the agricultural labouring class leave altogether, and in the case of schools under a mistress, about a year sooner. Although they leave so young, there is even then no complaint of entire want of knowledge, but that when they turn up again for confirmation, four or five years later, they have either lost all that they had previously acquired, or it has become a simple mechanical power of no practical use.

29. Some farmers suggest that this difficulty can be remedied on large farms, by giving the charge of the horses into the hands of a "horseman," by which means the lads are set free at the close of the day's work, without having to return to the stable (Evid. 97, 115). This plan has, however, found little favour, although the increasing disinclination of boys to become "mates" was constantly made the subject of remark; the hours are too long for them, and they are getting to prefer any other employment.

* "Were the State to take in hand the establishment of schools in every district which it considered to be beyond fair reach of "any existing school, *very few* would be required to supplement the existing provision" (p. 35).

G.
Cottages.

30. "Cottages," says one witness at Maidstone, "are bad generally, and insufficient in number. (Evid. 81), and yet it appeared to me that they were better than in any county that I have visited. In very many villages some landowner is resident, who is anxious to see the cottages present an agreeable appearance, and the flowers, which it is the common custom of the cottagers in this fruitful county to cultivate, renders many of them especially attractive. On one estate the appearance of the village, in which the residence of the owner is situated, creates universal admiration, but (as often happens), his whole attention appears to have been concentrated on this one place, and on the rest of the estate the complaints are loud of the want of sufficient cottages. Bedroom accommodation is spoken of as generally deficient, although the number remaining with one bedroom only, is comparatively small. The insufficiency in number, and still more the extremely high rents, have led to an increased number of lodgers being taken in. Some few cottages on the farms are let at 2*s.* a week, but the ordinary rents, demanded in the villages, average at least 2*s.* 6*d.* In East Kent the results of letting cottages with the farms are obvious, from the state of repair into which many have been allowed to fall, and the system appears to me to be on the decrease. In some cases I noticed that the great want of cottages had caused tenants to put up temporary wooden huts on their farms, in which the accommodation was most indifferent. Allotments are to be found in a fair proportion of villages, but on the other hand gardens are not by any means universal, and in the very rich hop-growing parishes are most insufficient in extent.

The HOP-PICKERS.

31. The condition of the immigrant hop-pickers in Kent engaged my especial attention, and I visited 25 parishes in the chief hop-growing districts during the time of picking. Besides this, I wrote to 70 of the principal hop-growers soliciting information, from 42 of whom I received more or less detailed answers. I obtained also the co-operation of the Society for the Employment and Improved Lodging of Hop-pickers, and to its secretary, the Rev. J. Y. Stratton (of Ditton rectory, Maidstone) I would here tender my heartiest thanks. Much of the following information was derived from him, and I would call your particular attention to the detailed statement in the appendix, with which he has furnished me.

32. No less than 41,000* acres were under hops in the county of Kent during the year 1868, and taking the usual proportion of four pickers to the acre, it follows that a very large population is employed in hop-picking, the great majority being of course home-dwellers; but it is impossible to estimate the number of immigrant hop-pickers (in which class I include all those who leave their homes to lodge elsewhere), at less than 25,000 to 30,000, of whom not very far short of 20,000 come from London and its suburbs. The returns obtained by me, relate to 13,000 of these immigrant pickers.

Change in class of pickers.

33. Not many years ago the extra labour required for hop-picking was supplied by the bands of Irish harvesters who were willing to lodge in barns, outhouses, or in the open air. But as the cultivation of the hop increased, and improvements in the mode of drying and preparing the hops enabled the hop-picking season to be very much shortened, more hands were wanted, and a new class of pickers was attracted from the metropolis; they consisted of the poorest inhabitants of London and its suburbs, of costermongers and small tradesmen, whom the dead season set free from their usual avocations, and of tramps. Children, however young, were generally brought with them, not only because even a very small child can earn something at hop-picking, but also from there being no other means of taking care of them.

34. For this class of pickers, which became more common every year, "accommodation was at "first (and excusably) inadequate." (Evid. 131.) They slept where they could, and even where temporary provision was made for their lodging the evil was perhaps aggravated by the overcrowding of the inmates. Nor was this the only or the chief complaint. Two or three weeks before the commencement of the picking, the exact date of which they had no means of ascertaining, thousands of poor persons overran the county of Kent, sleeping in the tramp wards of the union houses or in the open air, and in the daytime going round the country in search of employment. The inhabitants of the villages to which they went showed no sympathy towards a class of persons whose filthy, indecent, and disorderly habits made them unfit to be taken into their cottages, and who before the time of picking lived mainly by their depredations. The effect of this influx of strangers upon the resident population was grievously complained of; and when the hop-picking was over, and the vast population was paid off to return to their homes, the scenes of debauchery and riot which occurred were described as frightful. Still worse was the state of things if, as not unfrequently occurs in the hop-garden, a "strike" took place for an increase of remuneration, or some petty offence gave rise to a pitched battle between the immigrants and the natives.

35. It is not to be supposed that all hop-growers looked on at this state of things without attempting to remedy it. The efforts made, however, were very partial in their operation, and it was not until it had reached its climax by the constant increase in the number of immigrants, that the public opinion of the county was thoroughly roused, and it was determined to make an endeavour to remove the reproach which rested upon it in respect of the accommodation given to this population, and to devise some means by which the class of pickers might be improved, and more control over them obtained, by the planters. But only in 1866 was any united action taken, in which year the Society for the Employment and Improved Lodging of Hop-pickers was formed by the adhesion of the principal hop-growers of the county, by the support of many of the landowners, and by the exertions of Mr. Stratton. Its objects were two-fold,—(1) to promote the supply of better lodgings and accommodation for the hop-pickers, and (2) to establish a system of engaging them by means of respectable and trustworthy agents living in the town whence they came.†

(1.) Lodging.

36. With respect to lodging a very great change for the better has been effected. In 1868 the difficulty of providing adequately for their accommodation was increased by the number of pickers being larger than in any previous year. Yet it may be said with certainty that more than half of the

* By the Board of Trade returns, the whole acreage under hops in England is 64,500, so that two-thirds are in Kent.

† The religious aspect of the question—how best to provide for the spiritual wants of this immigrant population—was designedly omitted, to prevent any chance of thereby alienating any of the planters. Nor is it within my province to describe the efforts made for this purpose in many parishes.

pickers are now decently lodged, and the improvement which takes place in every successive year is very marked. G.

37. The accommodation recommended by the society, and now being gradually adopted, is the "hopper house," which may be described as a long low-pitched building of brick, stone, or wood divided internally into 10 or 12 compartments, about 12 feet square, each with external entrance. Every compartment is intended for a "bin's company" of six or eight persons, not including children, The number in each constantly therefore amounts to 12. Some growers attempt to set aside a compartment for each family, but the London immigrants more generally prefer that the bins' company which has come down to the hop-garden together should occupy the same compartment, and with these arrangements it is impossible to interfere. Other sorts of lodging are created by the "exigency of the service." Some growers erect buildings of straw or heath, others supply tents, which in fine weather are wholesome and satisfactory.

38. The tenements generally contain nothing but straw, or in some cases a low wooden bedstead which serves also as a seat. Candlesticks and shelves are occasionally, and should be always, furnished, and a very great addition to their comfort in wet weather is made by a covered cooking house. Such accommodation cannot be called luxurious, but it renders decent habits possible, and considering that the hop-picking season lasts only three weeks, appears to be as good as can reasonably be expected. Some employers, such as Mr. Ellis of East Farleigh, do far more for the comfort of their pickers, by providing medical attendance and any little luxuries that may be needed by the sick.

39. The improvement thus described is mainly due to the public opinion of the county, but in the second place to the society, which, by the information and advice it has issued, and still more by the standing protest it continually affords against the indifference formerly shown, has done much good. It cannot however be denied that very much yet remains to be done. In some districts, and especially in the neighbourhood of Cranbrook, very little change is taking place. It is not uncommon for growers to provide straw and hurdles, and to leave the pickers, immediately on their arrival, to build up any sort of shelter which their ingenuity can suggest. In other cases an old barn is thrown open and they are left to occupy it as they can, with such partitions between families or bins' companies as they may be disposed to put up. Sometimes "hurdles are put between the beds, "leaving them to twist straw in if they like; *they seldom do so.*" (Evid. 142.) In several cases that came under my notice at least 50 men, women, and children were living in one large temporary hut, without any attempt at partitions. In another the "lean-to's" round a barn, in which the owner would have been ashamed to put his cattle, were utilized for the purpose. Another especial complaint is want of cleanliness. Many of the buildings, decent enough in themselves, are allowed to get into a state quite unfit for habitation by being used in winter for the storing of roots or for cattle, without being properly cleansed afterwards. On one farm, where the pickers were lodged in a barn, the farm-yard outside was still full of manure. Another cause of filth is the want of privies, which are to be found as yet on few farms. On the other hand it must be admitted that employers have in many cases great difficulties to contend with in the filthy habits, and "the utter disregard for their good shown "by the objects on whom improvement is attempted."

40. Much opprobrium has fallen to the lot of the growers which ought rightly to be borne by the landlords. It is clearly their duty to provide decent accommodation for those employed on their land, for the tenant farmer, holding (as he generally does in this county) on a short lease, cannot be expected to do so. "Oast-house" accommodation for drying the hops is universally recognized as a permanent improvement to be made by the landlord, and on the same grounds accommodation in proportion to the acreage under hops for those employed in picking them ought to be provided by him. Some tenants, indeed, are bound by agreement to keep a certain amount of land under this crop, and "hopper houses" are at least as much a necessary appendage to such as farm as an "oast" house.

41. Of the accommodation provided by the public authorities I cannot speak highly. In the Maidstone union workhouse, which I visited in the height of the season, I found stables and every available space occupied by vagrants, but the workhouse is four miles from Maidstone and no building is provided in the latter place. In consequence of this the poor people arriving there late, have to spend the night in the streets. This year a large building was however erected near the river, but without any partitions, and all who came, young and old, male and female, were crowded together without any regard to decency.

42. "Much of the evil arising from overcrowding and from faulty structures would be checked," says Mr. Stratton, "if an inspector of these tenements was appointed, who would certify their fitness, and "the number each should contain" (Evid. 131); and he goes on to suggest that the weather-proof character of the lodgings, the amount of space, the arrangements for decency and cleanliness, and the supply of water, would all properly fall within the cognizance of such an officer. No doubt the change of air and scene and "the invigorating occupation of hop-picking" contribute to the general healthiness of this class. Nevertheless if an infectious illness does occur, as in 1849 cholera broke out at East Farleigh, the danger to the pickers and to the neighbourhood is so great as to make inspection desirable on this ground alone. The regulations now adopted for common lodging-houses, would, with some modification, exactly meet the case.* It would, however, be difficult to define the amount of accommodation required on a farm, which depends not only on the acreage of hops, but also on its nearness to a village, whence a supply of home-dwellers can be derived. Near Canterbury for instance, it is customary for the planters to fetch out their pickers in carts, and to take them back at night, thus avoiding the necessity of having to provide lodging for them. I do not see how any regulation could be framed so as to overcome this difficulty.

---

* By the Sanitary Act, 1868, sect. 35, the following regulations are enumerated:—
(1.) For fixing the number of persons to occupy such a house.
(2.) For their registration.
(3.) For their inspection.
(4.) For enforcing therein the provision of privy accommodation, and other means of cleanliness.
(5.) For their cleansing and whitewashing at stated times.

G.
2. Mode of hiring

43. The class of persons employed in hop-picking varies according to the mode of hiring. In East Kent a class of pickers more akin to the home-dwellers is to be found in those who come from the seaport towns or from Sussex villages, bringing with them furniture, beds, and cooking utensils. They are superior to the ordinary immigrants, and the inhabitants of the hop-growing villages are often not unwilling to receive them into their houses. They are not unfrequently hired through an agent in each town. In the neighbourhood of Maidstone many pickers are also hired through the agency of the "binmen" or gangers. A man living in London or the suburbs agrees beforehand with the planter by letter to bring down one or more "bins' companies" of from six to eight persons each, besides children. Generally each picker is paid separately for his or her work, but sometimes a system analogous to that of the "public gang" is adopted, and the ganger "brings down his party to the "scene of action, paying all expenses, feeding them miserably, and giving them perhaps a trifling sum "at the finish" (Evid. 81). "Sometimes a costermonger takes them all down in his cart, feeds them, "and gives them fixed wages, taking for himself the rest of their profits" (Evid. 137). In other cases also, even where each individual is paid the sum that he or she has earned, extortions by these binmen are represented as by no means uncommon, and at any rate some treating or remuneration is expected by them in return for their services in collecting the party. This system appears on the whole to work fairly well, if the grower carries out his agreement. Sometimes, however, when the hops go off suddenly, and the planter finds himself in no want of any hands to pick them, he is careless about giving notice to them not to come, and in one case no less than 100 pickers, arriving from London in accordance with their contract, found themselves thrown upon the road without employment or money.

44. The most objectionable mode of hiring is that already mentioned of collecting them from the roads, or from the tramp wards of union houses. It is no uncommon thing for a grower to send up at night to the union and to hire all who are to be found there, without any reference to decent behaviour or ability to perform the work. This system has been described as *a direct premium upon vagrancy*, and is a very great hardship to the respectable poor who have to leave London without any certainty of employment.

45. Before work begins in the garden, or very shortly afterwards, it is the custom of the principal hop-growers to read over to the assembled pickers a list of rules to be observed. In West Kent this includes fixing the "tally,"* or price which is to be paid for the work, varying in each garden according to the amount and condition of the crop. "In the event of the hops going off badly, owing to "disease or bad weather, the people will naturally become dissatisfied with their earnings; under such "circumstances," says Mr. Bannerman of Hunton, "the best course is to lower the 'tally' voluntarily "at once, before being compelled to do so" (Evid. 136). On Mr. Ellis's farm, where 1,500 pickers are employed, the "tally" fixed beforehand is rarely adhered to throughout; he anticipates complaint by altering the rate of payment (Evid. 135). Hops when about to go off rapidly must be either picked or lost, and "in such an emergency the grower is completely at the pickers' mercy" (Evid. 136). If a change in the "tally" is refused, a strike takes place, originated not unfrequently by the home-dwellers, whose experience enables them to discern the symptoms of an approaching change in the hops. Sometimes a strike is enforced by violence or incendiarism, and the grower, who cannot get other pickers at a moment's notice, or, if he could, would be unable to clear his garden of the occupants without a regular battle, has no alternative but to yield.

46. Throughout East Kent this difficulty is met by not fixing the tally till the conclusion of the picking, that is, by expecting the pickers to do work nominally by contract, although no contract price has been agreed on. The apparent injustice and onesidedness of such an arrangement is obvious, and it is condemned by the general opinion of the West Kent hop-planters, because it is clearly fair that both parties to a bargain should know the terms beforehand. There is, however, one security against injustice, which appears to prevent any serious complaint, and that is, that the planter who treats his pickers ill will have a difficulty in getting them another year. I think therefore that the grievance is more a sentimental than a practical one, and indeed in most hop-gardens it is very difficult to fix the tally until it is seen how the hops come down, or if it is fixed to adhere to it throughout.

47. In order to obtain some control over the pickers, and to improve the class of persons employed, a system of agency has been attempted by the society. Agents, generally Scripture readers, have been appointed in all the poorer parts of London, to whom pickers seeking employment are invited by advertisement to apply. The agent thus becomes the medium of communication between the pickers and the planter, which in the case of poor people, who cannot themselves write, is especially valuable. The names are entered in a register, after inquiry into character, and the pickers are sent down as orders are received for them. The great advantage to the poor is that they do not leave home without a certainty, of employment (Evid. 137), of decent lodgings (for this has formed a part of the stipulation made for them by the agent), and of having for their companions people of decent habits. To the planter on the other hand the system gives a powerful control over his pickers, because bad characters are punished by being struck off the register of the agent for future years; and if a serious disturbance arises, fresh pickers can be obtained at a days' notice. "An owner of hop land in Wadhurst was under the necessity "of resisting demands made on strike, when about half through the picking. All the hands were dis-"charged, and application was made to the society for a fresh supply. An inspection of the lodgings "provided for them was thereupon made, and the number of pickers required promptly sent from the "agency in Westminster. The work was completed to the satisfaction of the employer." (Evid. 134). Such a system of agency would appear to be sound in principle, but I regret to add that few planters have as yet taken advantage of it; in every case where they have done so their report has been favourable; and it is due to the South-eastern Railway Company to say, that they have contributed as far as possible to its success, as well as to the convenience of the poor hop-pickers, by providing special trains, and by kind co-operation with the agents of the society.

48. Of late years the effect on the neighbourhood of the large influx of strangers has very much diminished. By being lodged in buildings actually erected *in* the hop-garden they are withdrawn from

* The agreement is to pick so many bushels to the shilling, and is called the "tally."

much association with the home-dwellers, and the class of pickers is being gradually improved. Many growers employ the same persons year after year, thus having (although they do not always exercise it) a powerful check on their conduct in being able to strike off their list any idle or turbulent individuals. G.

49. Where decent accommodation is provided, the effect of the work upon the people themselves is not unsatisfactory, and it appears to me to call for no legislative interference. The hours are short, the labour light and easy, and being done by contract every one is too busily employed for mischief to arise from the sexes working together. Bad talk there is, and must be, but some check on it is imposed by the fact that each family works together round its own "bin" or its baskets. The employment is healthy and invigorating, and the immigrants return to their homes much benefited by the change of air.

CHESHIRE.

District visited.

50. In Cheshire I visited the agricultural district lying in the south-western part of the county, containing 105,000 acres, and a population of 17,000. In this county the parishes were originally of an enormous size, comprising many different townships, and some of them even now cover an unusually large area. This fact has rendered it especially difficult to bring schools within the reach of the whole of the population, and in consequence complaint was made at several of the meetings at which I was present of the large number of children attending no school at all. Deficiency of good infant schools, to meet the wants of the outlying populations, appeared to me to be the prominent defect, although hardly any parish was without a good school for the older children. "I cannot close my report," says Her Majesty's Inspector of Schools in 1867, "without expressing my strong sense of the public "spirit and generosity which the landowners of Cheshire showed with regard to the support of the "National schools with which they were connected, during the ruinous losses caused by the cattle "plague. I expected to find half the schools in the agricultural parts of the county closed, but on "the contrary every school has been kept open, and I doubt whether a single subscription has been "withdrawn." (Evid. 165). As might be expected from the causes above stated, I found night schools to exist in three only of the agricultural parishes that I visited. The attendance of neither boys nor girls is much affected by the demands of field labour. Schools.

Irish labour.

51. Almost the whole of these parishes being laid down in permanent pasture, the amount of labour required for the cultivation of the land is small. But for this, the want of sufficient cottage accommodation near the farms would be a more serious evil than it now appears to be. Nevertheless this fact, coupled with the great drain of the agricultural population into the manufacturing and mining districts, has led many of the dairy farmers to employ only such men as they can board and lodge in their houses, and has induced almost all to dispense with as much out-door labour as possible. During the summer, when it is essential, it is supplied to a great extent by the Irish, who flock over from their own country for the two or three months of harvest, or who, crowded together into the towns of Northwich, Middlewich, or Knutsford, work on the farms at a considerable distance from their homes. This has now become so recognized a system that some landlords have added to their farmhouses a room specially for the Irish. (Evid. 155.)

Female out-door labour.

52. Excluding Irish women and the labour employed in potato culture in the peninsula of Wirral, women work very little on the land in this county. The wives of the ordinary labourers are called upon only to assist in haymaking or in milking both morning and evening, for which, if paid in money (which is not always the case), they receive from 1*s.* 6*d.* to 2*s.* per week. The only objection to this latter employment is the very early hour in the morning at which it takes place, and the consequent intermixture of the sexes without any supervision.

Female in-door servants.

53. The number of female in-door servants is, on the other hand, very large, and though on the smaller farms the wives of the occupiers do the cheesemaking for themselves, with very little assistance from hired labour, on the larger the dairymaid is the most important person on the establishment, commands very high wages, and during the cheesemaking season cannot possibly be dispensed with. On such farms a vessel cleaner, and often other assistants, are required.

54. Amongst these female servants it was universally admitted that a very low state of morality prevails, and to this fact the large amount of bastardy in Cheshire bears some testimony. Few farmers in hiring appear to make any inquiry as to character, and it makes no difference whether a woman has had bastard children or not. The explanation given of this is that "the great scarcity "of labour and the necessity of such labour to assist the farmers' wives causes a girl who is known to "be a good dairymaid to be hired independently of her character." (Evid. 147.) And again Mr. Latham says, "the only point ever asked is, can she make cheese?" (Evid. 154.)

55. It is however a great question whether this state of morality is not mainly due to neglect on the part of employers. "The key ought not to be given to them on Saturday nights," said the farmers at one meeting. It is in fact the custom in some parishes (now, I am happy to say, a diminishing number), that a servant girl, before hiring herself for the year, stipulates to have the out-door key given her on one night in the week, so that she can go out herself or let any one in. (Evid. 150.) Such force has this custom, described by one witness as a "gigantic evil" (Evid. 145.) attained, that in the case of the smaller farmers it is represented to be almost impossible for them not to yield to the demands for its observance. It is fair to say that among many farmers the system has always been discountenanced, and various attempts have been made by gentlemen of influence in the county to put an end to it. In one parish "all the farmers signed a paper never to allow the key of the house to remain in their "servants' hands at night." And in other instances combinations among employers, which was represented to me as the only means by which a stand could be made against the custom, have been formed. The result has been to confine it to a more limited district, and, as the Rev. Chancellor Thurlow says at Malpas, "great improvement is taking place." (Evid. 164.)

Sunday labour.

56. Attempts have also been made by some of the principal landowners to diminish the amount of Sunday labour required of female farm servants. Cheeses are usually made on that day, on the ground that the milk will not keep till the following one. Mr. Tollemache, however, by building extra space

G. for storing milk, has to a great extent surmounted this difficulty, and prizes are now offered at the local agricultural shows for the best cheeses not made on Sunday. The success of these endeavours has hitherto been very partial.

Cottages. 57. The cottages, as I have already stated, are too few in number, and not very well distributed. The old black and white materials of which many are constructed present a picturesque appearance, but such cottages generally are in very indifferent repair. In respect of bed-room accommodation considerable changes are wanted, for though on some estates (such as that of Lord Westminster) very great progress has been made, on others no improvement has taken place, and must unfortunately be further postponed by the terrible calamity of the cattle plague. Rents, where a garden is given, average 4*l.* a year. Gardens are general in the smaller villages, but allotments are almost unknown. The neighbourhood of the manufacturing towns, causing their produce, which chiefly consists of damsons, to find a ready sale, makes the gardens in this county an unusually large source of profit. It is not at all uncommon to pay the rent out of the garden. Some landowners frequently give enough land to their principal labourers to enable them to keep a cow, while in every township on Lord Westminster's estate there is "a ley field for them to pasture their cows on in summer, and another for "them to cut hay from. For these advantages they pay 5*l.* a year, which many of them are ready to "do." (Evid. 158.) Of the merits of this system I shall have more to say presently.

Wages. 58. The usual wages paid in this part of Cheshire vary from 11*s.* to 12*s.* a week, without extras; but, owing to the large amount of permanent pasture, there is very little piece-work compared with other counties. Married men, who live at some little distance, who are required to work more than the usual number of hours, are not unfrequently paid partly in food; they are boarded in the farm-house, and receive in addition a weekly sum, varying from 7*s.* to 6*s.*, or even 5*s.* It is obvious that by this plan a man gains at the expense of his family, and, from that point of view, I heard no defence made for it. One advantage which the poor possess in this county is the abundance of butter-milk, which can be had almost for the asking, and, coming as I did from the south of England, I could not fail to be struck with the very great additional comfort enjoyed by families in this county from the cheapness of fuel.

SHROPSHIRE.

District visited. 59. In Shropshire, I selected for the purposes of inquiry, two groups of parishes containing a population of 20,000, and an acreage of 115,000. The first, in the neighbourhood of Wem, resembled in its northern portion the dairy district of Cheshire which I have just described; but on the Shrewsbury side there is more arable land, and the conditions of the agricultural life are different. Labour, which is not well distributed, is partly supplied, at busy seasons, by gangs of Irish, who are satisfied with any accommodation which barns and outhouses can afford. Women and very young children are very little employed in outdoor work.

The other district visited lies in the south-western corner of the county, bordering upon Wales. It is in every respect different from the former. The farms are smaller, employment is less regular, and wages are very low. There is very little independence among the labouring class. In this part of the county, women are more employed in the ordinary farm operations, sometimes doing a few days' work when required, on condition of being allowed to glean on the farm.

Cottages. 60. The point especially deserving of attention in this county, is the infamous character of the cottages. In the majority of the parishes that I visited they may be described as tumble down and ruinous, not water-tight, very deficient in bed-room accommodation, and in decent sanitary arrangements. On the whole they are more uniformly bad, and in a less improving condition, than in any other county visited by me. Two at least of the principal landowners in the north of the county have cleared themselves of the reproach of owning bad cottages by pulling them down, without adequately replacing them by others. On these estates the labourers herd in the open villages, while on many others, cottages are to be found, belonging to the owner of the soil, which are a disgrace to any civilized country. In one parish, out of 62 cottages owned by large landowners, 29 have one bed-room only, while out of 36 owned by railway and small proprietors only seven have this limited accommodation. (Evid. 196.) I would call your especial attention to the detailed accounts of the cottages in the villages visited by me.

Education. 61. With this state of things it is very difficult for those charged with the education of the poor to contend. "I find from questioning the boys to-day," says the schoolmaster at Clun, "that all but "one half of them belong to families living in cottages with one sleeping room." (Evid. 174). "It "is an insuperable obstacle," says another witness, "to a proper education" (Evid. 178), and we find accordingly from the report of Her Majesty's Inspector of Schools in 1868 that throughout this county "the number of children in attendance falls considerably short of the proper per-centage of the population" (p. 128). And again, even "if a very ample margin is allowed for private schools, it is hardly "possible to avoid the conclusion that large numbers of children who need instruction are left without "it, partly it may be from lack of school accommodation, but still more from lack of proper interest "on the part of their parents" (p. 129, and see Evid. 2). Field work certainly is, to a small extent only, the cause of this absence. The main hindrances are "the poverty and ignorance" of the parents, and the distance which many of the children have to go to school. Here, far more than in Cheshire, infant schools sadly need encouragement (Evid. 170), and schools of the better class (the effect of which in promoting good attendance has been apparent throughout these counties) are only very slowly finding their way into this district. Labourers' children become irregular at school about the usual age of 8 or 9, but are not found to be taken away for regular work till they are 11 at any rate, little pressure being put upon them by the farmers to go to it. One exception (Loppington) deserves notice. In this parish it is found "that the best paid labourers are the least educated. Labourers' "children ought therefore to begin work as soon as they can get it, and by this means it is hoped "that the children of the smaller farmers will keep ahead of their labourers in respect of education." (Evid. 184.)

62. The early age at which they are taken into farmhouses interferes, however, very much with the education of girls. Many go at 10 or 11, and, this, coupled with the fact that the labour to be performed in farmhouses is often very severe, appears to me to require serious attention. Early employment of girls in farm houses.

63. Cottages (miserable as they are) are not let at a very cheap rate. The larger landowners let many at 3*l.* 10*s.*, but the unusual number of cottages in this county which are in the hands of small owners causes the average rent to be from 4*l.* to 5*l.* Gardens are generally attached, but of very inadequate size. The allotment system is almost unknown, owing (as I was told) to potato ground in many instances being given by the farmers; but I found rent, and a high one, to be almost always charged for this, which makes it in fact hardly any boon at all. In the north, and especially on the estate of Sir B. Leighton, Bart., a good many cottages have land enough to keep a cow. Rents.

64. The condition of the peasantry, in no part very satisfactory, is deplorably low in the hill country of the south-west. The system of "privileges," and of part payment in beer or cider, on which I dwelt at some length in speaking of Dorset, prevails here, with several additional disadvantages. In the first place the hours of labour are not, as in other counties, strictly limited, nor is it an understood thing that extra pay is due to the labourer for extra hours of work. The usual remuneration for such extra labour is in food, but it is a mere matter of charity, given or not at the pleasure of the employer. Another unsatisfactory part of the system is the uncertain nature of the agreement entered into between the farmer and his labourer, for even the sum of money to be paid, and the time of payment, is not always settled beforehand. The custom of boarding married men in the farm-house, and giving them 6*s.* or even 5*s.* only in money, prevails to a considerable, though a diminishing extent; it has mainly been caused by the distance of the cottages from the place of labour, and it now generally implies that the man is to work for rather more than the ordinary number of hours. The usual money wages vary from 9*s.* or 10*s.* at Clun, to 11*s.* or 12*s.* in the north; overtime, as at harvest, is generally paid in food or drink, the value of which it is impossible to estimate; and the addition made by gifts or cartage of fuel, or by a cottage being given rent free, varies (as in the case of Dorset) on almost every farm. Wages, &c.

STAFFORDSHIRE.

65. In the county of Stafford so few districts are purely agricultural that I visited only the tract of country between Stafford and Uttoxeter, containing an acreage of 66,000 and a population of 16,000, not nearly all of whom are employed in agriculture. Most of this was pasture land, occupied in small farms for dairy purposes, and it was represented to me as being the poorest district in the county. District visited.

66. The wages were at least 12*s.* in money, in addition to perquisites; but in this, as in other grass counties, work was not quite constant. There was but little piece-work, and even harvesting was often paid by a fixed sum. The additions by way of perquisite were given only by some farmers, and were of the usual varied character. Indeed one farmer, in writing to me on the subject of the wages he paid, gave as one item in his estimate "the opportunity of sending their children to a free "school." The labour of women, though not very regularly employed, is thought valuable, and not to be dispensed with, especially on the threshing-machines in winter. Earnings, &c.

67. The exhaustive return contained in the appendix (Evid. 215.) gives a complete account of the state of the cottage accommodation. In the 63 parishes from which returns were received no less than 25 per cent. of the cottages had only one bed-room, and 9 per cent. contained a family with three children or more living in that one bed-room. I found, however, that considerable improvement is taking place, and on some of the larger estates good cottages are now the rule. Gardens are general, and allotments not uncommonly given by the great landowners. The neighbourhood of large towns forms a ready market for their produce, but involves the disadvantage that the rural population is more exposed to the impositions of travelling hucksters. Lord Harrowby has in some cases added to the cottages enough land to keep a cow, and has found the system to work well in keeping good labourers at home (Evid. 198). Cottages.

68. The attendance at school is considerably below the average. In consequence of this fact a very complete inquiry was made by the Archidiaconal Board of Education in 1868, and the deficiency was found to arise in part from a want of school accommodation; for 27 per cent. of the parishes expressed a demand for more schools (Evid. 199). The chief cause of non-attendance was stated to be the neglect of parents, while poverty was very seldom regarded as a hindrance. In only six agricultural parishes was early employment stated to be a cause of non-attendance, or of withdrawal from school. But even from my own limited experience I am convinced that this very imperfectly expresses the extent to which field work interferes with schooling; because in this, as in other counties, I found regular labourers anxious that their children should earn something as soon as possible, and though there is little demand by the farmers for the occasional labour of children, yet a good many boys are taken away from school altogether at 11, and occasionally at a younger age, to go with horses. Education.

RUTLAND.

69. A short visit to this county convinced me that it presented hardly any features worthy of special notice here. Very few parishes are deficient in school accommodation, two only, where there was any considerable population, being pointed out to me, and in these efforts are now being made to establish a school. The consequence of this is that the proportion of children attending school is unusually large, no less than 1 in 6½ of the population being on the books of Church schools alone, and 1 in 8½ being in average attendance at them. But knitting, in the case of girls, and field-work in that of boys, produces irregular attendance and early withdrawal from school. Boys seldom remain after 10 or 11 years of age.

70. In this county alone, I found two or three organized "private gangs" of women and children to be employed. Before the passing of the Agricultural Gangs Act they would have been classed as

G. "public;" but the mode of hiring is now changed; still, in one case, the children have four miles to go to work, and boys and girls are employed together in a manner which cannot be defended. On the eastern side of the county, where there is less grass land than in the west, women are a little employed, but girls very rarely.

71. The situation and condition of the cottages are grievously complained of, but on all the principal estates improvement is either taking place or is promised. In one instance a man and his family had to live for eighteen months in a barn, because his cottage, which was his only means of living near his place of work, was pulled down over his head. Many of the cottages were built by the occupiers, and, as usual, are of a tumble-down character, and contain generally one bedroom only. Rents are high; few decent two-bedroomed cottages being obtainable for less than 5*l.* to 6*l.* Allotments, which are large, and on which corn is usually grown, are common, but are too frequently allowed to fall into the hands of the small tradesmen. Wages are generally 12*s.*, but in a few cases beer is given in part payment. Piecework is, for the most part, confined to the hay and corn harvest.

(A.) Restrictions upon Moral or Physical Grounds upon the Labour of Women and Children.

Women. Extent of Employment.

72. Women are engaged in farm labour in all the counties visited by me, but the nature and extent of their employment varies in almost every parish, and frequently on adjoining farms. The greatest variety of female labour is to be found in Kent; the most regular and constant employment of it in Dorsetshire, while in the dairy counties of the west they do very little out-door work, but are in great request for milking and cheese-making.

73. The increasing disinclination of women to undertake any but light and occasional out-door labour was everywhere apparent. Certain employments, such as reaping, have gradually been almost abandoned, while others have come to be considered by many employers as unsuitable; and although the introduction of machinery has tended to create a greater demand for such labour at certain seasons, the number of women regularly employed appears to be very much on the decrease.* So much does this disinclination exist, that I found it very common for farmers to make it a condition of hiring the husband that the wife shall work at the particular seasons when such exceptional labour is required. Thus in Kent this season is that of tying and picking hops, in Cheshire that of hay-making, in Shropshire and Staffordshire only that of threshing corn, while in Dorsetshire alone, is regular and constant employment sometimes thus exacted from the wives of the labourers.

74. Work in the hay and corn harvest is the only occupation common to all districts; that of weeding corn or attending threshing machines is followed in many parishes; hoeing or "hacking" turnips, beating manure, or stone picking are confined to particular farms. Employments still more local in their character, among the hops and fruit have been alluded to in my description of Kent.

Objections to it.

75. The principal objection to field work for women is the loss of refinement which almost necessarily ensues. "It is most destructive to the female character," says Lord S. Godolphin Osborne. "When-ever any number of females work in company at farm work, especially when in that company there "are also male workers, the conversation is of a character most destructive to all purity of thought." (Evid. 4). "It tends to tarnish the purity of their minds and feelings and to make them 'mannishly' "coarse." (Evid. 6.) Even in Kent, where the light work in the hop gardens is "easy and suited "to females" and "is not inconsistent with health, morality, and general well-being," (Evid. 81,) it is described as "roughening" them (Evid. 84). Mr. Dudgeon, however, whose experience of Scotch female labour entitles him to be heard on this point, considers that this objection is obviated when they live in cottages on the farm, and so are sure to know each other, and not to be mixed with strangers (Evid. 216).

76. But, besides this, field work by married women causes a "loss of evening comfort to the husband" (Evid. 6) at the time, and too often renders the woman altogether unfit for domestic duties. No doubt some hard-working women do manage to attend to their homes in spite of outdoor employment, and some few employers go so far as to maintain that the best kept houses are those of women who work in the fields, but as a general rule my own experience, supported by the greater weight of evidence, leads me to the opposite conclusion. Indeed the principal complaint among the women who were compelled by their husbands' employers to go out to work was, that they were physically unable to attend also to their homes, and that, after allowance is made for wear and tear of clothes, waste of food, and damage done by children left at home, the addition made to their income is very small indeed.

General opinion on subject.

77. While generally admitting the force of these objections, the common opinion of the districts visited is to deprecate any legislative interference with such labour, mainly because it is not shown to be injurious to their physical condition, and the loss of earnings which would ensue would be felt very much by poor families. And certainly it would seem clear that the only ground on which such interference can be justified is, if the work in which they are engaged is unsuitable, or injurious to their health or morals. Of such work Lord S. Godolphin Osborne furnishes a definition. "Anything which tends "to form in women masculine habits is unsuitable, everything which overtaxes female power and is "dangerous to the female constitution is unhealthy." (Evid. 4.) Let us see what descriptions of work (if any) fall within these classes.

78. No doubt many women go to field work at times when it is most dangerous for them to do so. I heard many cases where they continued at work up to the very eve of their confinement, or returned within a very short time after it. As a rule, however, when undertaken at proper times, light field work is not only not injurious to their health, but the exercise and constant employment tends to promote it. Work in the hay, corn, and potato harvests, at hop-tying and hop-picking, in fruit gathering, or in the cultivation of a garden, cannot possibly be objected to as overtaxing the strength

* In Dorsetshire especially, the decrease is remarkable. While the number of male agricultural labourers has decreased only 2½ per cent. between 1851 and 1861, that of female labourers, out-door and in-door, has fallen 34 per cent.

of the female (the hours of work being generally only from 8 to 5); or, considering the time of year at which they are so employed, as being likely to expose them to any great extent to the inclemency of the weather; and indeed hardly any one, including the many medical men with whom I conversed, condemned it on this ground. When, however, it takes place in the winter, as upon the turnip lands, it is open to the latter objection, and many women refuse to go to this who are anxious for summer employment; while some farmers, thinking it unsuitable, have ceased so to employ them.

Work on dairy farms.

79. On the dairy farms the indoor work of women is undoubtedly far more severe. The hours, especially during the cheese-making season, are very long. The contract made with them by the employer often expressly requires work from 4 a.m. to 10 p.m., and during very busy seasons even these hours are exceeded. It should be remembered also that they have almost always to work on Sundays. Physically, however, the condition of these women was represented to me as not inferior to that of others, and on the smaller farms, the wives of the occupiers themselves, undertake voluntarily an exactly similar amount of work.

Work with farm machinery.

80. In my former report, I called your particular attention to the system of employing women with farm machinery, and I entirely adhere to the opinion which I then expressed on the subject, although it must be admitted that the weight of evidence from these counties is not so great as from Lincolnshire. The proper complement of a threshing machine is from 12 to 14, of whom two or sometimes more are women. They generally stand upon the stage of the machine to cut the bands and to hand the sheaf to the man who is employed in feeding the machine; sometimes they are put upon the wheat or straw stack, working with a pitchfork as a man would do. The great objection to be made to all such employment is, that it places them during the whole days' work in close company with men, exposes them to weather in an equal degree, and requires them to work the same number of hours as the men. The result certainly is that the women who constantly work with threshing machines, following them as they go from farm to farm, are generally amongst the most degraded of their class, although in physical condition they are more than half men. And further, it exposes them to especial danger. Accidents, which were very common in Lincolnshire to women employed in this way, are found to occur in all counties where the practice is prevalent, the dress of the woman rendering her especially liable to be caught by the machinery, unless she exercises unusual caution. The women themselves have a strong opinion of its unfitness, and many of them are not allowed by their husbands to go to it.

Work with ladders in Kent.

81. The employment of women on ladders, either to tie hops or to pick fruit, was much objected to in Kent on the ground of its indecent character and of their being exposed to the danger of falling from them. "It is dangerous and inappropriate," says Mr. Whitehead (Evid. 81), but it exists in few parishes, and is very much on the decrease; and before long the good feeling of employers will cause it to be altogether abandoned.

General recommendation.

82. With the exception, therefore, of employment with machinery, my decided conviction is that there is no ground for any interference with the labour of women. That such labour is in itself objectionable, and that it would be much better for themselves and their families if they would abstain from any but the lightest summer work, may be admitted; but there is no injury to health or morals of so serious a character, or so directly traceable to their employment, as to justify taking away from them a means of adding to the income of the family. "Women must earn and when and how they are to do it is a "subject most difficult if not inexpedient to define by law." (Evid. 4.)

Children's labour—its value.

83. The average value of the labour of a family cannot be estimated, even for a limited district. In some cases its effect is mainly to increase the value of the piece-work done by the husband, as in the case of "poling" the hops, where the man fixes the poles in the ground; but even a young child can give efficient assistance by placing them in a convenient situation for him. It may be said generally, that all such labour must necessarily be an advantage to the family, unless it in any way displaces adult male labour. In the case of women and girls this does not appear to result in any of the counties visited by me; boys, however, (especially in Dorsetshire) are sometimes put to work which in other places is assigned only to men; and restrictions upon such labour would, therefore, be less felt by the poor than might at first be supposed.

Its nature.

84. The labour of children is of two sorts; (1) where they are hired directly by the occupier of the farm, and (2) where they are employed by their parents on gardens or allotments, in assisting in gleaning or other family work, in collecting fuel or wool, and in gathering blackberries or mushrooms in the lanes. The latter class of employment is found in all districts, and is objectionable only as interfering with school attendance; but it will be understood that the following remarks apply only to the children hired directly by the farmers.

85. The amount of labour done by children, and the ages at which they are employed, formed a very important element in my inquiry; but the main difficulty in obtaining any reliable statistics on these points arose from the fact that the employers themselves rarely know the ages of the children working upon their farms. What is wanted by them is physical ability to do the work, and the age of the child, and his state of education, are matters of comparative indifference.

Employment of young girls.

86. Young girls are not much employed in these counties. In the hop districts and market gardens of Kent, a few go to field work, but rarely before 12 years of age. In the eastern part of the same county, and on some farms in Dorset and Salop, I found that when boys were deficient, they were occasionally sent out to tent birds, and for similar light work. In Dorset, girls (though rarely below the age already mentioned) do go to the same sorts of out-door work as the adult women, of which the mode of hiring whole families often adopted is the main cause. But wherever any domestic employment exists for them, such as glove-making in the vale of Blackmoor, they are always found to prefer it to field-work.

87. Such labour, wherever it exists, meets with much condemnation. "It is ruination to young "girls," says the chairman of a board of guardians in Kent. (Evid. 106.) "No greater evil," says Lord S. Godolphin Osborne, "social or physical, affects the agricultural population than the employment "of young girls; they are the destined mothers of another generation, and on their healthy condition "as wives will much depend the health and strength of the parents of both sexes of that generation."

G. (Evid. 4.) And he goes on to recommend that the age of womanhood fixed by the poor law (15) should be adopted as the limit of age before which girls should be forbidden to work.

88. In this opinion I am unable to agree. It must at once be admitted that such employment does lead to a certain loss of refinement, if they work in strange company, and separate from their mothers: in many cases, however, a girl is employed with her father or mother, or with some respectable neighbour, and provided that this is only in summer time, I can see no strong objection to such employment, except the suspension of education which must necessarily ensue. At the same time it would be difficult to discriminate between different sorts of employment, and, while permitting some, to stigmatize others as objectionable. The only true distinction which appears to me to have been made in this respect is between winter and summer work, and a regulation prohibiting work to such girls in the winter months would in my opinion meet most of the objections which have been raised to their employment.

89. It should not be forgotten that in exceptional cases the value of such labour to farmers is very great. I have before alluded to the potato districts, in which restrictions upon it would involve a diminution of the area under that crop, and the same thing may be said of the cultivation of peas, flax, and hops, all of which require an enormous number of hands during certain parts of the summer, at which time of the year out-door employment is actually beneficial to their health. To interfere with these by legislation would not only therefore be a disadvantage to the farmer, but would materially affect the income of poor families. Where a girl is sent to regular daily work, the balance of profit, after deduction is made for the loss involved in other ways, appears to be very small; but it is otherwise as regards this occasional employment at busy seasons. In hop-picking, for instance, girls of 12 can often earn 2*s.* a day, and the amount obtained even by infants is an appreciable addition.

Employment of boys.

90. Boys are usually put to "bird-keeping," or other light work upon a farm, as early as 7 or 8 years of age. At harvest they often lead the first horse in a team, but are rarely put to regular work with horses until they are 10 or 11, or, in the west of England, till a later age. To this Dorsetshire is an exception, boys being occasionally put to such work as early as 6, and in many cases beginning continuous employment with sheep or horses before they are 8. It is due to the farmers to say that this is often done at the earnest request of a constant labourer.

91. Where they are put only to light work (in which I include all descriptions at present done by them with the exception of work with horses), where the hours are not too long, nor the employment continuous throughout the year, hardly anyone appears to think that physical injury results to them. On the contrary, employment in the open air is decidedly productive of health, and the earnings thus obtained often lead to the parents being able to provide them better food. It conduces to habits of industry and obedience, and where not continuous assists in providing for the school fees. The case of boys is moreover in another important respect distinct from that of girls, in that by field work the boy is actually acquiring that practical knowledge which will make him a useful agricultural labourer, should he continue in that sphere of life. It is a mistake to suppose that agricultural labour is entirely unskilled; the best ploughmen are said to be "carter-bred" (Evid. 97), that is, the sons of carters brought up amongst horses, and accustomed to their habits from their earliest years.[1]

92. Another consideration which cannot fail to have weight is the fact that much of the labour done by them is on some soils essential to good farming on the modern system, and if they are to be withdrawn, it must either be neglected altogether, or else done by women and grown-up girls, an alternative which few persons will be disposed to prefer. It will on the whole "require a strong case "to justify interference." (Evid. 4.)

Boys with guns.

93. The only description of light work to which much objection was taken was the permitting very young boys to be in possession of guns for the purpose of frightening birds from corn (Evid. 108). Though accidents are said to be rare (Evid. 107), such an employment must be admitted to be likely to lead to them, and it is satisfactory to find the system limited to a very few parishes in Kent.

Employment with horses.

94. But employment with horses, when regular throughout the year, appears to me to be the reverse of "light." The hours are very long, (often from 5 a.m. to 7 p.m.), it gives little leisure to a boy, and requires him to walk every day at least 10 or 12 miles over ploughed ground. In most counties no farmer would think of putting a boy to such work, unless very exceptionally strong, before 10 or 11 years of age, yet in Dorsetshire many boys, as before-mentioned, begin at 7 or 8. One very large employer of such boys near Wimborne, who begged that his name might not be made public, considered all fit to go with horses at 6, and to plough at 8 or 9 years of age. In that county, indeed, the per-centage of boy labour is excessive, and it seems probable that to this cause, next to insufficiency of food, is partly traceable the stunted condition and early decrepitude of the adult population.

95. In my former report I called your attention to the Act 3 Geo. 4. c. 126. s. 131, by which boys under 13 are forbidden to drive a cart along a turnpike road. In all these counties, but especially in Dorset, this provision is being openly evaded every day, without any attempt being made to enforce it.

96. The prohibition contained in that Act was probably based on the ground of danger, either to the boys themselves or to the public using the high road. This anticipation is not borne out by the evidence I have obtained; hardly any accidents, and those to men as often as to boys, are stated to arise from it. But the objections to early employment with horses are very strong. Dr. Aldridge, of Dorchester, attributes to it "the prevention of proper muscular development, and very often the production of "tuberculous diseases" (Evid. 5). "The sameness and overhardness of toil mars the young and "yielding bones and muscles" (Evid. 6). "It is seen in their after life in a way to me most clear; "there is a want of physical energy, of what I may call labour-pluck, a deadening of mind and body "force" (Evid. 4). "A boy of this sort (7 or 8 years old) gets up with his father at 4 or 5, has to help "to prepare and feed the horses, walks from 6 till 2, except a little halt for meals, then comes to "dinner, and returns to feed the horses. I see the effect of this early work in making the boys bow-"legged" (Evid. 23).

General recommendation.

97. On physical grounds alone, therefore, there appears to be no reason for interfering with the ordinary light labour to which boys are now put at occasional seasons, but rather some grounds for encouraging it. But on the same grounds I believe that the opinion even of farmers in most counties would agree

in condemning continuous work with horses at an early age, and in fixing 11 or 12 as the very earliest time at which it ought reasonably to be undertaken. The only means suggested of securing this object, without interfering with occasional employment, would be some requirement of school attendance up to that age, on which subject I shall have more to say presently. G.

98. The hours of labour of women and children in the fields call for no legislative interference. Except in the case of the dairy farms, and during the busy times of harvest, women usually work from 8 a.m. (or sometimes 7 a.m.) till 5 p.m. Boys work the same hours as the men, but their work is generally well adapted to their size and strength. At bird minding they sometimes begin earlier, but it is not an active employment, and the only objections to it are the exposure which it involves, and the want of any stimulus to mental exertion. In all cases a certain interval is recognized for dinner, and there is commonly no objection to an occasional cessation of labour at other times of the day. Hours of labour.

99. It may be a question whether some check ought not to be imposed on Sunday labour. On dairy farms, where it is described as an especial evil, it must probably be left to the good feeling of employers to effect. At bird minding, and when employed with horses, boys are required to work on Sundays as on other days. In the latter case, a re-adjustment of the hours for "baiting" horses could easily be made so as to give boys an opportunity of attending school and church; but, whether by the same boy or not, rooks must be kept off the corn throughout Sunday as on other days. In one instance in Kent, I found the father doing the work for his son on that day during the hours of Sunday school. It has been suggested that work on alternate Sundays only should be permitted, but it is doubtful how far such a restriction could be enforced in the case of boys attending no such school when not employed. Sunday labour.

100. In these districts women and children are rarely taken long distances to work, the Irish gangs out of the large towns of Cheshire and Shropshire constituting almost the only exception. In other cases the work is at no such unreasonable distance as to call for any special notice. Distance to work.

(B.) Education.

101. The general result of the remarks which I have already made on the educational condition of each county comprised within this report may be thus expressed:— Result of previous remarks on education.

In the west (in the counties of Chester, Salop, and Stafford), the school accommodation is insufficient, but especially in respect of infant schools in outlying districts, and the attendance of children, though in general not much affected by field work, falls considerably below the average. Night schools reach only a very small proportion of the population.

In the south, on the contrary, (as represented by Dorsetshire and Kent), schools are for the most part in existence within reasonable reach of the mass of the population, and in the latter county are on the average of a high order. Field work, however, has in both counties very considerable effect in causing the early withdrawal and constant absence of children from school. Night schools are in consequence more common. The eastern counties, reported upon by me in 1868 (Lincoln, Nottingham, and Leicester), and Rutland, fall also within this class, although the deficiency of schools is greater.

102. On this state of facts I found two general propositions.

A. *The great and crying want* of all these districts *is not additional school accommodation.* In every county, if private schools be included, it is at present in excess of the demand; nor does this statement take into consideration the obvious fact that, if by any additional inducements or persuasion regularity of school attendance can be secured, no difficulty will be found in providing adequate accommodation, "I "feel certain," says the Rev. A. T. Bonner, one of Her Majesty's Inspectors of Schools, "that if "managers generally were sure of due attendance, which implies a large amount of income, both in "school pence and grant, complaints and inability to provide requisite funds for a certi- "ficated teacher would cease at once; in other words, I believe compulsory attendance would render "compulsory rating needless. It is irregularity in attendance that is the sore point of our schools."* Nothing is more disheartening than irregular or partial attendance; only make it certain that all who are of the proper age shall attend, and the difficulty of school accommodation will be almost entirely surmounted. (A.) School accommodation not insufficient.

103. No doubt the teaching in many of these schools is unsatisfactory. In Shropshire especially there is a large tract of country entirely without any good school. It is, however, a fact which needs to be confronted, that good schools do not always produce good attendance. It is said with truth that they succeed in their work, not by means of, but rather in spite of, the regular methods of discipline and instruction adopted in them. Wherever children's labour is in much demand, the restrictions of a good school cause many boys to be kept away altogether and sent to a dame's school, or lead to their early withdrawal. This is partly caused by the earlier age at which, under an improved system of teaching, children attain the amount of knowledge which is considered sufficient by their parents; but mainly by the struggle for existence among the poor, which makes them wish to be free from any restrictions likely in any possible case to interfere with earning (Evid. 91).

104. However this may be, it is clear that the money now expended upon the better class of schools in an agricultural district directly benefits the very poor to a small extent only; indirectly, of course, by putting before them a higher standard, and bringing more practically before the parents the advantages which accrue to a child from a better education, the effect of such schools is enormous; but since at present the children of labourers are leaving school at 10, and often 9, or even 8 years of age, the difference to them of a good or a bad school is little felt; and unless some provision is made to ensure that the especial class who most need assistance in educating their children shall avail themselves of them, grants of public money to such schools are to a great extent wasted.

105. Distance from school is no great obstacle to attendance in the case of the older children in any of these districts. The evidence, on the contrary, shows that the most distant scholars are often the most regular and punctual (Evid. 186). But in the case of infants it is still felt (especially in the west of England), to be a very serious difficulty. The great necessity of such agricultural districts is Infant school.

* General Report on Salop, Stafford, &c., 1867, p. 130.

G. the multiplication of infant schools. Thus the Rev. R. K. Haslehurst, of West Felton (Salop), asks—

"What can be done for the education of infants in a parish such as this, which though containing only 1,067 inhabitants, is at least five miles long? If I am to have *only one* infant school, I don't know where to put it; in fact, I can literally do nothing with only one; I want *at least three*. I think the Education Board would do well to act more liberally for the encouragement of infant schools" (Evid. 170).

"Children ought to be sent very much earlier than they are" (Evid. 110). "They ought to read "at 7 years old, and to read well by 9." This point is strongly insisted on by many witnesses.

Central schools. 106. Another plan often dwelt upon as the best means of bringing a good school within reach of small villages is the creation of "combination" or central schools, that is, where groups of contiguous villages having only infant schools combine to support in the most central a good school for the older children of all. In two instances I have met with such attempts, originated by the support of the chief landowner. The first, at Ollerton (Notts.), is threatened with failure in this way,—one of the subsidiary parishes, containing a population of more than 1,000, has opened a good school for itself, the result being that the central schoc has lost a great part of the support on which it relied for its maintenance in efficiency. Exactly a similar fate seems likely to befall the other attempt at Sheldwich in Kent; and in both these cases the landowners are put in a difficult position with regard to the central school which they have established. Without some central authority to regulate the relation between the school managers of the different parishes, their more general establishment can hardly be hoped for.

(B.) Defects in attendance. 107. B. On the other hand, *the great need* of all these districts *is a check on the early withdrawal and irregular attendance of children*, and some security that all shall attend a school.

108. Early withdrawal will be seen from what I have already said, to be in the case of boys, the great complaint. In Kent the average age is 10 (or in dame's schools 9). In Dorset it falls to 8 or 9. In Cheshire and Staffordshire they leave between 10 and 11, and in Shropshire perhaps rather younger. It will be observed, however, that this is the *average* age, and implies many boys being taken away a year or two sooner. In Shropshire especially and in the parts of Dorset where gloving is very common, the same complaint of early withdrawal extends to girls.*

109. Even before these ages irregularity of attendance, sometimes during many months of the year, is represented as a great hindrance to education. At Knockholt (Kent) "during seven months in the "year the attendance is very fluctuating. There is no real effort made to send the children." (Evid. 128.) At Cranbrook from October to February inclusive, we have nearly 12 months' work to do in school, as the constant "breaks in attendance do away with the work done at other times." (Evid. 98.) The girls are almost as irregular as the boys, particularly in these districts where the mothers go a good deal to work, and they are kept at home to mind the baby, or to look after the house.

110. Absolute non-attendance is far less complained of. It is curious that this appears to be more uncommon in those counties where field labour makes the greatest demands upon young children. In Cheshire, Shropshire, and Staffordshire, where there is not generally very much employment for them, a far greater number are said never to attend school. There is in this respect a great distinction to be drawn between small country parishes and those containing a population exceeding 700 or 800. In the former, chiefly because they are more thoroughly under the eye of the clergyman, the complaint that families never send their children is comparatively rare.

Causes of non-attendance. (a.) Neglect of parents. 111. The main cause of the absence and irregularity of the children is undoubtedly the ignorance and neglect of parents. Even where they will send their children a little, they have not yet begun to appreciate the difficulty of learning. "I sent her a whole year," one woman said, "and she can't read," and so she thought schooling useless. (Evid. 110.) The most trifling excuses are assigned; "wanted at home" often means little more than that the children being employed on Monday the parents have not thought it worth while to pay for the rest of the week's schooling. (Evid. 84.)

112. In some few parts of my district this indifference on the part of the parents has been represented to be on the increase; but the evidence more often points to the growth of a better state of feeling in this respect. The parents are beginning to see more and more (and I was especially struck with this in Dorset) the practical advantage which a boy gains by starting in life with a better education, and they are in consequence attaching a higher value to its attainment. In this class of life, however, the power of control which parents have over their children practically ceases at a very early age. The wilfulness and caprice of children, so often complained of by school managers, means really that when they have begun to earn, they are rapidly emancipated from domestic restraints. "It is that sort of independence which a boy soon assumes after he has entered the labour "field." (Evid. 4.)

(b.) Employment. 113. Next in importance in keeping boys away from school is early employment. I have already described the two sorts of labour done by children as that hired directly by the farmer, and that employed by the parents. The latter sort of work is by far the most injurious to regularity of school attendance, though it is not responsible for early withdrawal. Here is a list of employments in one Kentish village, "strawberry and gooseberry picking, hop-tying, hay-making, gleaning, hop-pick-"ing, blackberry picking, and acorn collecting" (Evid. 108); for all of which the parents kept their young children at home. In another it is said, "besides employment by farmers there are other things "which keep children far more away from school, such as getting cowslips, blackberries, and acorns." (Evid. 201.) "Many of the boys are taken away from the school for weeks at a time to attend to the "cultivation of the allotments, and this makes it very difficult to maintain anything like uniform "progress." (Evid. 13.)

* There is reason to think that children are withdrawn from school younger in some counties than they used to be. Mr. A. Austin in his report on the employment of women and children in agriculture in 1843 says of a district which includes Dorset, "the average lowest age at which children were finally taken from school to work in the fields is 10 years and 23 weeks, and the "average highest age 12 years and 1 week" [p. 45]. Of the western counties, however, (including Dorset), the Rev. J. Fraser, in his Report to the Education Commission, 1861, says that he is "persuaded that children on the average stay longer at school" (p. 58); and in the report of 1843 Mr. Vaughan says of Kent, that work withdraws "nearly all at the age of 10 or 11, and some "much earlier." My own opinion certainly is that they are leaving school younger than formerly.

114. Direct employment by farmers, or the prospect of getting it, is however, the main cause of early withdrawal. Many are kept away only because the parents are expecting to procure work for them (Evid. 76), or because "they ought to be earning something." But it is the fact of early employment by some farmers which gives encouragement to such expectations. G.

115. Poverty is not often *directly* the cause of non-attendance. Even among the largest and poorest families those who are anxious to send their children to school before the age when they are of any value as bread-winners, always manage to afford it. It is only when the opportunity offers of adding a few pence to their income that the state of their resources naturally prevents their being able to resist the temptation. Bad cottages are far more frequently to blame. Almost everywhere it is the family living in the worst cottage and in the most degraded state that is especially careless or irregular in this respect. (c.) Poverty.

116. The last hindrance to education to which I shall call your attention is the system of yearly hiring, especially where (as near Dorchester) whole families are engaged. "By this system the children in "the school change every year, and that generally between two examinations." (Evid. 26.) "We "get a totally new set of children every year; our maxim is that a boy loses six months by change of "school." (Evid 27.) The families of the yearly labourers are generally "growing up without "control, as they never stop long enough in a place to come under the same moral influence as the "resident poor." (Evid. 31.) (d.) Yearly hiring.

117. In framing remedial measures for this state of things, the first and principal object would appear to be to interest employers in the work of education. Many instances of harmonious action might be quoted where a farmer has made a sacrifice to enable a particular child to continue under instruction, or the clergyman is not such a rigid adherent to fixed rules as to be unwilling to recognise the occasionally urgent demands of the farm; but the tendency of the present system is too often to cause the two forces to pull in opposite directions. The majority of farmers are, however, no longer altogether hostile to education, and very few at any rate are willing to avow it openly. The feeling of the more educated employers is well expressed by one of them, "Enlighten a labourer reasonably, but "don't let it be only book-learning. If you prevent his being employed under a certain age, you hinder "his being taught to get his living. A boy that is going to be a clerk is learning how to live when "at school but *one that is to be a farm labourer* is learning what is a luxury to him." (Evid. 87.) These words contain the whole secret of their opposition. Their fear, and a well-grounded one, is that labour will become scarce, and that educated men will be drawn away to less laborious and better paid employment. The farmer's object is to educate the boy so as to keep him as a farm labourer, while that of school managers on the other hand is to give a boy such a foundation of simple knowledge as to enable him, if otherwise capable, to improve himself and to rise to a higher station in life. These distinct and opposite aims it is impossible to reconcile, and this appears to me a conclusive reason why it would be detrimental to the progress of education to throw the management of country schools into the hands of the ratepayers. Two points must, however, be conceded to employers; first, the necessity of boy labour at certain times of the year in some districts, and secondly, the advantages which accrue to a boy physically and morally, from occasional employment. But if it is attempted by legislation to take away boy labour altogether, or to put such restrictions upon it as practically to prevent its employment, school managers must be prepared not only not to expect the co-operation of employers, but to contend with their open hostility. Considerations in framing a remedy.

118. It is not for this reason only that severe restrictions are to be deprecated, but also because the absolute loss of the earnings of the children cannot be endured by families without an amount of misery which can hardly be estimated. Take a case known to myself. A.B. farm labourer, has six children and 10*s.* a week in wages. His eldest son, between 11 and 12, is earning 3*s.* Deducting rent (1*s.* 6*d.*) there remains less than 2½*d.* a day per head for food and clothing, or *if the son's earnings be deducted*, less than 2*d.* And I must do employers the justice to state that on all occasions they pressed this point upon my attention as of paramount importance.

119. Bearing in mind these two considerations, I shall make a few observations upon the principal suggestions for the improvement of education in country districts which are to be found in the evidence appended; they are,— Remedies suggested.

(I.) The general establishment of night schools.
(II.) Prohibition of all employment before a certain age.
(III.) Prohibition of all employment until an elementary education has been attained.
(IV.) The requirement of some school attendance as a condition of employment.

I. The General Establishment of Night Schools.

120. This involves in the first place a great increase in their number; not more than one-fourth of the parishes (and if town populations were excluded a still smaller proportion) maintain a night-school, and yet there are comparatively few, except under very unfavourable circumstances, where the experiment has not been tried and failed. Dorset is an exception, there being double the number of night-schools in that county, and a far larger proportion of scholars.

121. The great difficulty is that in country parishes they have to serve the two-fold object (1) of giving ignorant adults a knowledge of their alphabet and the mere rudimennts of reading and writing; (2) of being a supplement to the day school, so that the education there begun may be carried higher and wider; these two classes requiring a totally different mode of instruction, and it being practically impossible, both on this ground and from a respect for the feelings of men grown up in ignorance, to teach them together.

122. With respect to the former class night-schools are making but little progress. To help such scholars requires a large number of additional teachers, and the closest personal supervision. "It is "requisite that the teacher or teachers should take them singly" (Evid. 129). For trained schoolmasters this is disheartening work, and they are generally very reluctant to undertake it. "We thought "that teaching monosyllables to those who had neglected our good schools occupied more time than "could be consistently given to such work" (Evid. 195). The men too, who have been persuaded by

G. the clergyman, or some friend, to come, find it more difficult to learn than they expected, and after a fortnight's trial drop away.

123. The attendance of the second class is found to vary considerably in different counties. Some employers are unwilling that their lads should be off their premises at all, and make no attempt to arrange their work in such a way as to render it possible for them to attend. (Evid. 84.) In other districts the distance of the school is an insuperable difficulty, which is likely to increase under the modern system of isolating farms and the cottages attached to them.

124. It is found in fact that the greater part of the children who do attend a night school after leaving the day school are those who least need it. They are the boys who have made the most satisfactory progress, and who are the most anxious to avail themselves of the opportunities afforded for retaining their knowledge, while those who have been irregular and feel themselves after a year or two of absence to be deficient in acquirements, are ashamed to exhibit their ignorance by attending a night school. Thus at Eastchurch (Kent) "the only evening scholars materially benefited are those who "have been pretty well taught previously." (Evid. 129.) At Swanage (Dorset) again, "15 years "experience in night school teaching shows that those who leave the day school at 9 or 10 with very "imperfect education seldom come to the night school as a supplement." (Evid. 42.) And at West Felton (Salop) "those who most value the evening school are generally those who (comparatively "speaking) least want it." (Evid. 195.)

125. This result is also partly produced by the interval of time which is generally suffered to elapse between leaving the day, and beginning to attend the evening school. This gap is often an intentional one on the part of school managers, in order to prevent the latter from having the effect of causing children to be sooner withdrawn from the day schools, a view which is adopted by the Committee of Council on Education in recognizing no children at a night school before 12 years of age. A strong feeling was nevertheless expressed at the meeting of the West Kent school teachers that even with this precaution they tended to injure the day school (Evid. 76.), and the effect of leaving this interval, during which all education is suspended, is universally complained of. "I have been astonished to "find in an evening school young men who rose to the second class of a day school before leaving to "go to work, and in a few years have become ignorant of even the letters of the alphabet." "The "greater part of them have forgotten how to read, except with considerable effort, and it is hopeless to "expect them to explain words" (Evid. 94.) "On comparing young men at our evening school with "each other, it is often difficult to see any difference in attainments between those who have attended a "day school and those who have not." (Evid. 24.)

126. A further difficulty is the impossibility in small villages of obtaining good or sufficient teachers, and of providing the necessary funds. A master, who has worked conscientiously during the day, is too much exhausted, and it is hardly fair to expect him to teach. This is the cause generally assigned in parishes where the attempt has been abandoned,* and although this might be surmounted by a more liberal grant, the other reasons given appear to me conclusively to show that night schools cannot be reckoned upon as a sufficient means of bringing the education in rural districts into a satisfactory condition.

II.—Prohibition of all Employments before a Fixed Age.

127. The age usually named is 10, but sometimes even 12 or 13. Occasionally, as in Lincolnshire, it is thought by some farmers that any higher limit than 9 would be a hardship to them. On grounds of health, as has been already pointed out, the evidence shows no such check to be necessary, and it may therefore be asked why such children should be kept from earning anything to a later age than those employed in the unhealthy indoor work of factories. Such a restriction would, moreover, afford no guarantee whatever of attendance at school, but from narrowing the resources of the family would make the school payments more difficult to afford, and danger would be incurred of leaving large numbers of children to run about the streets instead of learning how to earn their bread.

III.—Prohibition of all Employment until an Elementary Education has been attained.

128. This scheme would offer encouragement to every attempt at self-improvement, whether at school or at home, and some inducement to self-sacrifice in view of a prospective benefit. Wherever children's labour is in demand, it would interest all employers in the work of education, and above all it would afford a means of enacting a uniform law for the regulation of every description of juvenile employment. On the other hand, it would throw the whole burden upon the parents, who under the present system obtain, by means of the occasional employment of their children, money to pay for their education during the rest of the year. It would subject the children to no regular system of discipline, and would not meet what is at present the chief complaint. The standard to be fixed must clearly be one which there is reasonable hope of boys being able to pass at 11 or 12 years of age. But quick, clever boys will attain this amount of information at 10 or even 9 years, and will leave school altogether with a sort of government certificate that they have received a *sufficient* education. To my mind the weight of evidence points unanswerably to the necessity of keeping children a few years longer than at present under the influence of school training. The majority of labourers' children at school are now receiving instruction "with minds more capable of acquiring than of retaining it." Education, it has often been said, does not consist only of information; what a man *is*, rather than what he *knows*, will have the greatest influence on his after life; for it is not only forgetfulness that is complained of, but a boy that is entirely emancipated from control before he is fit to govern himself. "They are boys," says Lord S.

* A strong opinion was often expressed that one great want is the multiplication of evening schools; one witness says, "assistance to multiply night schools rather than to make them very good would be most valuable; several small evening schools "even tho' taught by inferior teachers, would be far more useful in a large parish than one central one held by a certificated master. "By such rough means a more ignorant class would be effectually reached than under the present system." (Evid. 84.) A valuable hint was thrown out by the Rev. H. W. Dearden, of Maidstone, who suggests that the large number of educated clerks in such a town should be utilized in surrounding villages; many would gladly teach in a night school, and in a very efficient manner, the difficulty is to provide for their remuneration, unless Government will recognize them as teachers.

Godolphin Osborne, "before they have ceased to be mere children, act and speak as men before they "have ceased to be boys." (Evid. 4.) G.

IV.—The Requirement of some School Attendance as a Condition of Employment.

Instances of "half-time" schemes.

129. Almost all the principal places in which half-time schemes for children employed in agriculture have been attempted being within the district assigned to me, I propose to give a short sketch of the results attained.

130. One of the earliest attempts of this description was the Teddesley Farm school (Staffordshire), established by the late Lord Hatherton. The class numbered from 26 to 30 boys between 11 and 15 years of age. They received school instruction from 6 to 8 o'clock every morning in a spare room in the farm yard. "The boys' increased steadiness and diligence in the field more than compensated for "the curtailment of their hours of labour." (Evid. 222.) Some difficulty was found, however, by Lord Hatherton in dispensing with the boys' services just at the hour when they were most wanted on the farm. This may have been the reason for the abandonment of the scheme.

131. The experiment of Mr. Paget, late M.P. for Nottingham, at Ruddington (Notts.), was described in my previous report.* In November 1854 he took eight boys for employment on his farm, each boy spending half his day at work and half at school, but he found an inconvenience in this arrangement. When the boys' clothes were wet and dirty from their morning's work, they were unfit for school; he therefore changed his method, and the boys now work on alternate days. They are between the ages of 9 and 14. During harvest and at other busy times the system is broken through, and all the boys are required to work, by which means the number of days of school attendance of each boy during the year is reduced to 91.

132. At Rostherne (Cheshire) Lord Egerton of Tatton "grieved at the early age at which boys were "taken from school," employed upon his farm eight boys, paying them full wages on condition that they went to school one half the day, and to work the other, the four who are employed in the mornings one week working in the afternoons the next. They are put to every sort of farm labour, under the supervision of an experienced workman. They are all between the ages of 12 and 15. (Evid. 152.)

133. A similar plan has been adopted at Oulton (Cheshire) by Sir P. De M. G. Egerton, Bart., M.P., who takes eight boys for employment on his farm and garden during half days at 1*s.* 6*d.* a week. They are divided into two gangs, one goes to school in the morning and to work after dinner, the other goes to work in the morning and to school in the evening. A great deal seems to depend on the willingness of the bailiff to enter heartily into the scheme. (Evid. 148.)

134. At Acton (Cheshire) the industrial school, said to have been most successful, is now discontinued. No less than 60 boys between 10 and 15 were more or less employed for the half of each day in agricultural labour. But in this district the demand for young boys on the farms is very small, and this, combined with the unwillingness of the present managers of the schools to maintain it, probably led to its discontinuance.† Even in manufacturing districts, whenever the demand for boy labour is slack, the employers begin by getting rid of the children under educational restrictions.

135. Similar attempts have been made in several industrial and reformatory schools, and with uniform success. At the excellent district school of Quatt (Shropshire) all the boys over 9 are required to assist in the work necessary to cultivate a farm of 10 acres arable and two pasture under the superintendence of a special teacher. School hours are from 9 to 12, before and after which they work upon the farm, or take their turn in looking after the stable and the cows. Even before the age of 9 they are occasionally put to light work. The profit earned by this means towards the cost of the maintenance of the 30 boys amounted last year to 70*l.* (Evid. 221.) Other places where this sort of industrial training is adopted are the reformatory schools at Whitchurch in Dorsetshire, and Bradwall in Cheshire. (Evid. 154.)

136. The education given is in all these cases represented to be satisfactory. At Ellesmere they progressed "nearly, if not quite as well as though they had no loss of school time." "Their "education is far better on an average," it is said of Ruddington, "than that of boys that have "attended school without work to 12 years. The half-timers take as good a position in our school "as those who come whole time." The effect on the school is not, however, limited to the boys themselves. "Remaining to a later age, their attainments are greater, and they give a higher tone "to the school." At Rostherne it was thought to be "an encouragement to good attendance and "an incentive to industry." "From continuing under supervision they become more humanized, and "better mannered, and certainly would present a strong contrast to the clownish dolts of their own "age who present themselves for hiring each Christmas time."

137. The best proof of the excellence of the education is that it is very rare for a boy educated under most of these systems to continue an agricultural labourer in after life. Every one of the boys employed during the 15 years of Mr. Paget's experience has ceased to be so. In the same way, out of 25 boys who have been through Lord Egerton's training between 1863–8, five only are now working upon a farm (Evid. 153). From the school at Quatt "very few are taken away by farmers and put "to agricultural work, but the demand for them for other sorts of service and for various trades is "very great." (Evid. 221.) The lessons which are taught by this appear to be that a mixed system of school and work, regular or irregular, can produce excellent educational results, but that the age to which the system of training has been carried is unnecessarily high for the mass of the agricultural population.

138. It should be borne in mind that every one of these attempts presupposes a good elementary education before the commencement of labour. "I took none," says Lord Hatherton, "who were not "able to read and write, say the church catechism, and do a little mental arithmetic." In the same

* 1st Report C. 157.

† The same reason probably led to the discontinuance of several similar attempts in this neighbourhood, the foundation of which was mainly due to the Rev. J. P. Norris, Her Majesty's Inspector of schools, who was anxious that the system should have a fair trial. Boys were educated on the half-time system at Middle (Evid. 183) Tarporley, and Ellesmere.

G. way a fair knowledge of reading is the condition of entering upon Mr. Paget's farm; and in fact these schemes have generally been worked so as to afford a means of continuing education to boys who have already done well at school and who would otherwise be withdrawn from it. "They are selected "from those boys who are steadiest, and most forward in school work." (Rostherne, Evid. 153.)

139. Parents have been found to give their approval to these schemes, even where they have had to forego half the earnings of their sons. It will be observed, however, that in most of these instances the boys are paid full wages for half a day's work; and it may be said generally that, with the exception of the system of Mr. Paget, who has tried to carry it out as a practical farmer,* all these attempts have been supported artificially, and at considerable expense, by gentlemen keenly interested in the subject. It is therefore no wonder that farmers have been found unwilling to imitate the example set before them, even in a modified form. One employer at Ruddington has hired two boys in this way, but no other similar case was brought to my notice.

140. It is probably for the same reason that in Mr. Paget's case alone the system is so worked as to meet the difficulty of the farmer requiring an increased amount of labour at certain seasons of the year. In all the other instances no modification of the system is permitted even at busy times, for the simple reason that the main object has not been to work them as they would be worked upon a farm, and with the same economy. It may therefore be said that the success of these attempts affords no proof, except in Mr. Paget's case, that any such plan could be adapted to the general wants of farmers, but the fact that none of them have adopted it tells rather in an opposite direction. Even Mr. Paget, in spite of his success, does not consider the principle carried out by him to be capable of universal application to farm work, but proposes the substitution of a far more irregular system.

Experience and general opinion against a rigid system of "half time."

141. This inference, which I have drawn from experience, is entirely in accord with the opinion of all the districts visited by me; the few persons who recommended the adoption of a regular system of half time, that is, a requirement of school attendance during part of every day or week, hardly venturing to describe it as really practicable. The possible distance of the school from work, the want of clothes, and the weariness which necessarily ensues from field labour, appeared to me fatal objections to the half-day system, even if it were not also most inconvenient to employers. Attendance on alternate days, or during part of every week, would be no less difficult to enforce, owing to the requirements of the weather and of the seasons, the fluctuations of the supply of labour in particular villages, and the special needs of various modes of cultivation.† Most employers said at once that they would employ no boys under such severe restrictions as to school attendance. The loss to the boys themselves of out-door training, and of income to the families, would be ill compensated for by the improvement in their education.

Plan suggested.

142. While rejecting all rigid half-time schemes as impracticable, the majority of employers are ready to admit that, if not carried on to too late an age, a requirement of school attendance during a certain part of every year, as a condition of employment, would be very little hardship to them. The East Kent Chamber of Agriculture deprecated all compulsion, but at the same time resolved that "some means should be taken to secure the attendance of children at school *during part of every year* "*up to* 12 *years of age*." (Evid. 78.) "The hours of employment of all children," said the Staffordshire Chamber in 1867, "between the ages of 8 and 13 should be so regulated as to afford an opportunity "for attendance at school during a certain portion of that time." (Evid. 199 a.)

143. In the western counties the feeling of employers was almost unanimous. In many cases they were ready to agree to children being entirely excluded from field labour up to 12 years of age, although they represented that the loss of earnings would be seriously felt by poor families. In Kent, if 12 be the limit up to which restrictions are to be imposed, the weight of evidence is almost as strong that, without any serious inconvenience, children could be spared to attend school during at least half the year. (Evid. 86, 92, 93, 97, 118, 122, 123, 126.) In some cases they are said to be free during a longer period. (Evid. 117). In Dorset, as might be expected from the early age of commencing work, the opinion of employers was generally against any restrictions after 10. But if a rule were to be laid down, which appears to me to be required upon physical, no less than educational, grounds, that regular and continuous employment with horses is not to be entered upon until at least 12 years of age, the demands of occasional work upon a farm are not so great even in that county as to render such a requirement of school attendance a real hardship to employers.

144. The great advantage of such a system would be that it would give farmers a direct interest in education. The greater the demand for boy labour, the more effective would be the stimulus to employers to see for themselves that the attendance at school, before which employment is forbidden, is completed. It is for this reason that I have before so strongly urged the necessity of promoting, rather than of discouraging, the occasional employment of young boys. It affords a means of securing a minimum of schooling, which no other plan short of compulsion could achieve.

145. Such a modified system of half-time has found many advocates among school managers. The feeling in favour of some pressure, direct or indirect, is very much on the increase. The meeting of West Kent school-teachers was unanimous upon this point. (Evid. 76.) "All our teaching," says the Rev. G. R. Moncrieff, "is powerless for effective good so long as nothing is done to compel the attend- "ance of children up to a reasonable age" (Evid. 79), and he goes on to argue in favour of a scheme for rendering steady attendance at school in winter the condition of employment in summer. It is however, commonly objected that a requirement of school attendance during so many days or hours

---

* "I also wish to say emphatically," writes Mr. Paget, "that the system costs me nothing; that on the other hand I believe I gain by it as a farmer, for on any day when I want more boys to drive carts I inform the schoolmaster, *and only pay the boys* "*for the time they are at work*, and at no higher rate than other employers in the village." (1st Report, appendix part 2, p. 318.)

† It is suggested that particular times of the year might be excepted, as would of course be done in the hay and corn harvest; but if the principle were once admitted, the exemptions claimed would vary in many parts of each county. In potato districts children of all ages are much needed in October, and boys of 11 during part of the winter; for pea pulling children are wanted in June, for osier peeling in April, for hop-picking in September, for fruit gathering in July, and interference with these would in every case reduce the area under the crop.

in the year would lead to such irregularity that very little (if any) progress would be made. One answer to this is to be found in the experience derived from night schools, open only about 40 times in the year, and for 1½ hours at a time, and yet the scholars are found not only to keep up their previous knowledge, but sometimes to extend it. G.

146. The minimum of attendance during the year must, however, "be fixed high, not less that 200 "half days, so as to restrict the time of work to the months when it is really necessary." (Evid. 79.) Such an amount of attendance would very far exceed that of the majority of children now at school, who, on the average, do not attend nearly one half of the school year.* And it must be carefully considered whether the requirement of so large an amount of attendance would not throw the majority of children altogether out of work, and so utterly frustrate its own object. If employment is to be made a means of securing school attendance there is the strongest motive for giving every reasonable encouragement to it, and therefore I should not venture to recommend at first a longer period than 150 half days.

147. That any such restrictions should cease at 12 years of age is the almost unanimous opinion of employers, and, having regard to the poverty of many families, it would seem to be prudent to fix that limit for the present; as to the age of commencement, there is more difference of opinion, for on physical grounds occasional employment may reasonably be entered upon at 8. There is one forcible reason which points to the same age. It is that fixed upon by the Factory Acts, and in many districts the agricultural and manufacturing population are so intermixed that, until a revision of those acts takes place, to fix a higher limit in the case of employment in agriculture would open the door to systematic evasion.

148. The simplest mode of enforcing any such system would be to require before employment in any given year a certificate of school attendance during the previous year. As March is the usual time for the commencement of field work, the year might be reckoned from that date. There would be no difficulty in point of detail in requiring schools to send in, at the end of the year so fixed, the amount of attendance of all children, and there is strong ground for believing that the jealousy which would be created between certificated and uncertificated children would prevent any very easy evasion of the rule.

149. Much more cannot be claimed for such a scheme than that it appears to me to be the best possible under the circumstances, and likely not to defeat its own aim by putting an end to employment. It would in fact lead to pretty regular attendance during the winter and to occasional in summer; and though this would no doubt cause some difficulty to school managers, it may be assumed that if a grant were given for such children as "half timers" such an objection would not be generally pressed.

150. Its practical success, however, depends mainly on the children having previously received a sound elementary education. And before 8 years of age, when the children cannot go to work, and when their parents are actually glad to get rid of them for the day, it cannot be pretended that even poverty affords much obstacle to attendance. Some inducement, however, is required, and as none is ever so powerful as that which holds out to the parents the prospect of some advantage to accrue from the sacrifice, it might reasonably be enacted that even at 8 children should not be employed, unless they can read fairly well. This plan has found many advocates in my district, and is that adopted by Mr. Paget (who fixes the age at 9) with most satisfactory results.

151. Of the children attending no school at all, those belonging to families receiving out-door relief constitute a large proportion. And yet I found very few boards of guardians availing themselves of the power contained in Denison's Act, which enables them to pay for the schooling of such children. In Kent it is occasionally made use of with good results; in the Canterbury, Cranbrook, and Bridge unions this was especially brought to my notice. In other counties it was not uncommon for guardians to inquire of the pauper whether the children were kept regularly at school, but such schooling is not, as in the unions above mentioned, regularly paid for. The necessity of making the adoption of the act compulsory was strongly urged upon me, as well as its inability to reach cases where the relief is only of a temporary character. Application of Denison's Act.

152. Before quitting the subject of education, I have a word to say upon the possibility of combining a system of industrial training for girls with the ordinary work of a day school. The necessity for such training was everywhere impressed upon me, not only from the scarcity of good household servants, but also because of the ignorance of such subjects displayed in every cottage, and yet schools were very rare in which anything was taught beyond needlework. Sometimes a little knowledge of household work was imparted by the girls being required to clean out the schoolroom in turns, and theoretical teaching on such subjects was not uncommon, but is of very little practical use. In most counties there are schools supported by benevolent persons (such as that of the Hon. Mrs. Portman, at Blandford), where girls wishing to be trained as domestic servants are lodged and boarded, but a large outlay is then necessary; and it was very rare to find any attempt to combine such instruction with the ordinary work of a day school. Industrial training for girls in schools.

153. The expense, indeed, is generally represented to be the main difficulty in the way of introducing an industrial department into ordinary schools. "It appears to be simply and entirely a matter "of finance." But it is further urged, and great stress was laid upon this at the meeting of the West Kent School Teachers' Association, that the consent of the parents was very difficult to obtain. This was very frequently stated as an objection, but as a matter of fact it does not appear to be the case where the system has been practically in operation.

154. As to expense, the truth is that too much is aimed at. If the intention be to train good domestic servants, no doubt considerable expense would be incurred; but if it be only to teach the elements of cooking and household work sufficiently for the wife of an agricultural labourer, there is strong evidence to show that this can be achieved at a very cheap rate. A good instance of this is that of Stokesay school (Salop), where the simplest cooking was taught, "*with the common apparatus* "*of a cottage kitchen,*" by the wife of a labouring man. The whole expense for the year was 8*l.*, without reckoning the value of the cooked food, which was distributed to the sick poor. "The parents,

* The school year may be taken at between 200 and 220 days.

G. "far from objecting, liked the system very much, and said that their children became very useful to "them at home" (Evid. 223). Again at Well, in Lincolnshire (population 202). "The oldest girls "take it in turns to prepare a dinner for eight or ten of their schoolfellows; the cook for the day "remains behind the night before, and comes early the following morning to prepare for it. The girls "are responsible for all the arrangements, the dishing up, the service, washing up, &c. By marketing "herself, and by ready money payments, the schoolmistress is able to provide this meal at a small "cost" (First Report, Appendix, Pt. II., p. 280). It will be seen by these instances that a large parish is not essential to the success of such a system (as has commonly been asserted), nor need expense be an important consideration. But I will go further and say that to carry it out on an expensive scale is to impair its usefulness, because the object is solely to teach girls how to cook the simplest food with the most ordinary cooking utensils.

155. The success of these two attempts induces me to hope that the simple system of adding a cottage kitchen to the school will have a further trial.

(C.) The Home of the Agricultural Labourer.

State of the cottages.

156. From what has been already said on the subject of cottages it will be seen that in the counties comprised within this report they are better distributed than was found to be the case in the east of England, although in Shropshire especially, some of the largest landowners have pulled down their old cottages without building new ones. But their condition in all these counties (with the exception of Kent), is at least as bad. The great deficiency is in bedroom accommodation. Thus, in 42 Dorset villages no less than 314, or 16 per cent. of the cottages have one bedroom only, and 113 of these contained a family with three or more children. In one village alone there were 59 one-bedroomed cottages. A similar return from 63 Staffordshire parishes shows 596 small cottages, of which 212 were overcrowded to the extent before mentioned. And although I have no such accurate statistics for Shropshire, I am persuaded that a similar return would have exhibited no less lamentable a picture.

Efforts of landowners.

157. That the remedy for this state of things lies mainly in the hands of the landlords is obvious, and it is therefore gratifying to find that most of them are now ceasing to look for a direct return for cottage improvements in the shape of an increase to their rent-roll, but are recognizing the advantage which they and the occupiers of their farms derive from the better condition of their labourers, and their disposition to stay where they are well housed. One hindrance to more rapid improvement has been the extravagant ideal set before many landowners by the buildings of their richer neighbours; and though often anxious to remove the great causes of complaint on their estates, they shrink from the expense of the ornamental cottage which it is the fashion in their neighbourhood to erect. This is partly due to leaving the whole management of improvements in some cases (especially where the landlord is non-resident), in the hands of an agent, who indulges his own crotchets to the loss of his employer and of the poor*. While an estate contains many families living in one-bedroomed cottages, ornament and luxury should be matters of comparative indifference.

Remedies suggested.

158. Amongst other legislative remedies, it is sometimes suggested that all landowners should be required by law to provide cottages in proportion to the size of their estates; and further, that no cottage should for the future be erected without a specified amount of accommodation, and without compliance with certain rules deemed necessary for health and decency.

159. The first of these suggestions appears utterly impracticable. The number of cottages required for each hundred acres of land depending upon the nature of the soil, and the mode of cultivation adopted, no general rule on the subject can be laid down. The common number would be two, or sometimes three, but more often one would be amply sufficient; and indeed this point, namely, deficiency of cottages upon or near the farms, or within convenient distance of the place of labour, appears likely (now the check formerly imposed has been removed by the "Union Chargeability Act,") to meet with a satisfactory solution. Employers are keenly alive to the necessity of good accommodation in order to secure efficient labourers, and the class of farmers now entering everywhere into the occupation of the farms is pressing the matter upon the attention of landlords in a manner which cannot fail to produce great effect.

Government loans for cottage building.

160. More efficient encouragement to cottage building might, however, be given by the state. The powers of the 27 & 28 Vict. c. 114, under which money borrowed for this purpose may be charged upon the inheritance, are a step in the right direction; but many difficulties have been found in practice to interfere with their being more generally made use of. The conditions imposed by the Inclosure Commissioners are complained of as too severe; they have been guided by fixed and rigid rules, making no allowance for particular circumstances, and in consequence the extra outlay involved has deterred many persons from going to them. This power applies moreover only to entire re-building, while the addition of a bedroom or the general reconstruction of the premises would be a quicker, and almost as substantial a benefit. Precautions could easily be taken against the possible abuse of this concession.

161. Other suggested difficulties are, that the Enclosure Commissioners do not lend the money, but the borrower has to go to companies who require to make a profit, and that the time within which repayment has to be made is far too short. Both these points have in other cases been conceded by Parliament. With respect to "populous places" the Labouring Classes Dwelling Houses Act, 1866,† authorises the Public Works Loan Commissioners to advance money for the erection of labourers cottages, and the period for the repayment of such loans is extended to forty years. The curious result of this is that if a landowner forces his farm labourers to live in a town at a distance from their work, he can get a loan

* As an instance of this I may mention some cottages which I saw being erected on one of the large estates in Lincolnshire Although built of stone, very handsome, and very costly, they had only two bedrooms each, and these bedrooms had only one window between them, making the partition also a most imperfect one.

† 28 Vict., c. 28. In the same way the Artizans and Labourers Dwellings Act 1868, for the improvement or demolition of any premises "in a condition or state dangerous to health, so as to be unfit for human habitation," is confined to places containing a population of 10,000.

from Government to help him to build cottages: if on the other hand he wishes to put them on the farm, in a healthy country district where ample ground can be assigned for gardens, he is unable to obtain any such assistance.

Requirement that all cottages should be built in conformity with certain rules.

162. With regard to the suggestion that provision should be made against the erection of cottages containing inadequate accommodation, it would be found impossible to lay down any invariable rule as to the number of bedrooms a cottage should contain, for some in every village should have two, others for old men and widows only one. Among the most successful visited by me were some double cottages with five bedrooms between them, the middle room being so adapted as to be available for either cottage, according to the size of the family occupying it. Some other requirements, however, such as proper provision for ventilation and water supply, for drainage, and the erection of a privy to each cottage in a suitable place, might well be made.*

Working of Sanitary Acts.

163. To carry out any such regulations would naturally fall within the province of the Inspector of Nuisances, and for this reason the working of the present system of inspection was the subject of constant inquiry by me. At present the inspector is appointed† by the Board of Guardians, is dependent on their votes, and is generally the relieving officer, who has already enough to do, and receives very inadequate remuneration for his extra duties. Under these circumstances it has come to be the accepted rule among such officers (with some creditable exceptions) that they are to do nothing "*proprio motu*," but are to wait until their attention is called to some nuisance too intolerable to be any longer endured. But in some unions no inspector whatever is appointed,—in others the clergyman and Guardians of the Parish are expected to act. In one (Sturminster Newton, in Dorset) I found the police filling the office with great advantage to the appearance and sanitary condition of the villages. Under such varied modes of proceeding as this, the Sanitary Acts have not had a fair trial.

164. In three especial respects great reform appeared to be necessary. First, as to the abatement of *out-door nuisances*, of which in some unions no notice whatever is taken. The filthy state of many Dorset villages has been already described. Secondly, *overcrowding* in cottages, with respect to which the powers given by the Sanitary Acts are very rarely exercised.‡ And it may be presumed to be from a doubt as to the extent of those powers, that the overcrowding which now notoriously exists in many cottages is not interfered with; and, thirdly, *ventilation*.§ "The windows in cottages ought to be larger, and should be made to open" (Evid. 32). "Rooms in many cases are very low, hardly 6 feet, and the windows are very often not made to open" (Evid. 58, Cerne). "Often the window does not open" (Stower Provost, Evid. 58). "The windows are small and not always made to open" (Clunbury, Evid. 196). Dr. Aldridge "knew a cottage, without ceiling or floor, and containing 8 or 10 persons, with a window certainly a foot square, but without the possibility of being opened, the consequence being fever among the inmates" (Evid. 5).

165. Until my attention was especially directed to this subject by these statements, I could hardly have believed the extent to which windows in bedrooms are even now being put up without any means of being opened; and in living rooms the complaint is almost as common. Where in an old cottage the single bedroom has been divided into two, it is not unusual to find that the only means of light afforded is by a glass tile which cannot be opened. Although as to all these points (unless perhaps overcrowding) the powers of the existing Sanitary Acts are not represented to be insufficient, their efficient enforcement is sadly needed. Inspection must be compulsory, and above all things the inspector must be thoroughly independent of a Board of Guardians.

Situation of cottages.

166. The best situation for cottages, whether upon the farms or in the village is a question to which it is difficult to find a satisfactory answer. To build them close to the farm is a very great boon to farmers, and gives them far more control over their labourers. No doubt it also removes many a working man from the temptation of a public house, and saves much labour to him in going to or from his work; but it is far easier for him to do so than for his children to go a long distance to school. Intelligent labourers, whose opinion on this subject is entitled to great weight, generally say that the education of their children is the first point to be considered, although it is probable that they are to some extent influenced by the consideration that on the farm they are far away from the society of many of their friends, and from the shops at which they deal, and are brought too much under the power of their employers. It is pretty clear that the same system will not apply to all districts.

Control of cottages.

167. A still more difficult question is in whom the control of the cottages is to be vested. Should they be kept in the landlord's hands, or let with the farms? This point has occupied my attention throughout my inquiry, and especially in the eastern counties, where very great importance is attached to it.

168. The opinion of farmers is nearly unanimous. They represent it to be an essential point that the tenant should have some security that the cottage built for the accommodation of his farm shall really be available for it. And as regards certain special labourers, such as the foreman, shepherd, and carter, the only way, it is said, in which the farmer can get a proper control over them is by having the cottages in his hands in which they live. "Should any one of them be unfitted for his post, "it does not necessarily render him an unworthy tenant to the landlord; but what means has the "farmer to provide himself with another man to supply his place, there being often no other suitable "house at hand?" (1st Rep. App. Pt. II., p. 281). "It is most important to the farmer to have

* The necessity for some such provision is well illustrated by an instance I met with in Leicestershire, where two rows of cottages were built facing each other, between which, opposite and close to the front doors, were the privies and pigstyes. In Salop, the pigsty is constantly a part of the same building as the cottage.

The bye-laws sanctioned by the Treasury, Feb. 14, 1867, under the 29th Vict. c. 28, require in all new buildings, for which money is advanced under that Act, separate water-closet accommodation for each tenement, dust-bins, ready access to water, and good lighting, "by external windows *made to open*."

† Under the Nuisances Removal Act 1860, sec. 9, his appointment is permissive only and not compulsory.

‡ By the Sanitary Act 1866, nuisances remediable under the Nuisances Removal Acts are made to include "any house or part "of a house so overcrowded as to be dangerous or prejudicial to the health of the inmates."

§ By this I do not mean any system of artificial ventilation, for outlets of this kind are invariably stopped up by the inmates. In almost every case where I have found a fire place in a bed-room, the chimney has been blocked up with paper or old rags. Large windows made to open, and well placed are the best and only means of ventilation. The fault to be found in the most modern cottages, especially where they have an ornamented roof, is that the windows are too near the floor of the bedrooms.

G. " his shepherd, stablemen, and a few others, so under his control that he can dismiss them at his will, " and therefore he ought to have the power to give the same notice to quit the cottage that he gives " to quit the service." (Evid. 63.)

169. The feeling among the labouring class is even more certain. In all my inquiries upon this point *I never yet met a man* who preferred to "live under a farmer," as they call it. The apparent advantage in point of income enjoyed by a man in Dorset, who is a yearly servant, and lives in a house attached to the farm, is great (Evid. 64.), and yet even there the labourers had the strongest objection to the system.

170. With great reluctance I have been forced to the conclusion that, except in certain districts, and in the case of special labourers, there is no system more fatal to the independence and comfort of labourers than that of letting cottages with the farms. It is admitted even by those landlords who express this opinion, that for skilled labourers it is important to the tenant to have a few cottages under his control,* and in the same way there are cases where the farms are so isolated from any village that, unless the occupiers of certain cottages work for the tenant of the farm, there is very great difficulty in obtaining labour. The latter difficulty is often met by the landlord making it a condition with the occupier that he shall give his services, if required, to a particular farmer.

171. With respect, however, to the great majority of cottages, the objections to the system are overwhelming. His reasons for disliking it are thus stated by Lord Portman:—

" First, the occupiers of cottages have sometimes been persons whom I have wished to get rid of, but who have been good labourers, and therefore useful to the farmer. * * * Secondly, I have found that in some cases the farmer has oppressed the labourer by actually making him pay such a rent as to produce a profit from the cottages which I have let to the tenant with the farm, or by putting into a cottage lodgers beyond its capacity. And, thirdly, I have found the farmer constantly neglect to look after the cottage, not only by omission of whitewashing, but by neglect of simple cleaning." (Evid. 62.)

172. For these complaints there is unfortunately ample ground. The cottage is in some cases no doubt made a means of extortion, and when given (as in Dorset) as a part of wages, it is often only on condition of an unknown, unlimited, and unremunerated amount of additional labour. But the chief objection appeared to me to be the state of neglect into which they are allowed to fall, and the overcrowding which is constantly permitted. Of the former evil East Kent, where cottages have been on many estates long let with the farms, affords sufficient proof, some of the worst being those under this tenancy. Overcrowding I found everywhere, but especially, and as a recognized system, in Dorset. One farmer in Salop, to whom two cottages were let, told me that in each case, though the families contained five children, lodgers were always taken in. " It ought to be stopped," he said with emphasis, and yet it never seemed to occur to him that he was directly responsible for the scandal.

173. The opinion expressed by Lord Portman is endorsed by the majority of landlords throughout my district. Many of them expressed to me the strongest feeling on the subject, and Lord Westminster has afforded the best proof of his concurrence by taking all his cottages into his own hands. But in almost all these cases the right of nomination is conceded to the farmer, although the rent is paid to the landlord. " Practically I give the tenant the absolute nomination, and I give my agent full autho- " rity to act when I am absent in dismissing the occupier, when necessary." (Evid. 83.) The clergy also, as a rule, concur in approving this arrangement. " All sub-letting is a great evil. A landlord " can only effectually secure that his provision for the moral conduct of the labouring class is not " abused by holding all his cottages in his own hands." (Evid. 63.) " It is open to abuse by placing " the poor man too completely at the mercy of his employer. I have known very hard cases result " from it." (Evid. 20.) " It opens room for cases of great tyranny on the part of the employer, and " as often keeps the house in a bad state of repair." (Evid. 3.)

Lodging of lads in farm-houses.

174. Farm lads are less lodged in farm houses than they used to be. Kent, where the system still exists, and Dorsetshire, where it is almost unknown, afford an opportunity for considering the merits of the two modes of hiring. The education of the lads undoubtedly suffers where they live in the farm house, because they are further removed from the night school, and the indifference of employers and their hours of work are serious obstacles in the way of their attending it. In respect of health it is certainly an advantage, because it takes them away from an already overcrowded cottage, and secures them better and more nourishing food. But the great complaint urged against it in Kent was the want of proper supervision by employers, and the miserable character of the accommodation given to them. Often they sleep only in the farm buildings, or even in, or quite close to, the stable. They lose what should be the refining influence of home, and for want of anything to awaken their interest or intelligence, degenerate frequently into mere " louts."

Allotments.

175. The system of letting allotments of land to the poor prevails to a very great extent in Dorsetshire and Rutland, on some estates only in Staffordshire and Kent, and is very rare in Cheshire and Shropshire. In the last case it is superseded by the potato ground let by the farmers, but the high rent commonly charged for this privilege renders it a very questionable benefit.

176. The advantage of an allotment to the labourer is admitted on all hands, although its value depends on many circumstances. It must be reasonably near at hand, and the rent low. Some of those in Dorset are let at an exorbitant rate. (Evid. 65.) It should be limited in size. Far too many in the same county are half an acre in extent, on which ploughing and the cultivation of corn is permitted. Few persons are found to approve this, for it leads to irregular work on the part of the labourer. In one case I was told that a man lived upon his half acre of allotment, and in many others that the occupiers were willing only to work at occasional jobs. From allotments of this size, when not granted with discrimination, results also a very greatly increased employment for the young children, and a tendency among the labouring population to depend too much on the potato

* Lord Portman, who lets four cottages on each farm in this way, for the most important labourers, inserts in the lease clauses enabling him at any time to inspect the state and condition of the cottages, requiring the tenant not to allow more than —— persons above the age of 12 years at any one time to inhabit the cottage, and in the event of any person who shall be considered by him to be an improper person occupying the cottage, the tenant is to discharge him forthwith on receiving notice. (Evid. 62.)

crop. The more general opinion appears to be that the maximum size for such gardens, save in very exceptional cases, should be a quarter of an acre, and where the soil is reasonably good half that quantity is sufficient. In one Dorset village the produce of quarter of an acre allotments was estimated at 1*s.* 6*d.* and 2*s.* a week all the year. G.

177. In the western counties, and in Rutland, a few landowners are accustomed to let to some of their labourers two or three acres of land, in order to enable them to keep a cow. In Cheshire a modification of this plan is found in the "ley," or run for a cow, assigned at a small rent in some villages to those labourers who desire it. The inquiries which I made into this system (and especially on the estate of Sir Baldwyn Leighton in Shropshire, who has adopted it for many years), lead me to form a very favourable estimate of the inducement to thrifty habits, and of the comfort it afforded. "A "good cow will at least produce 6*s.* or 7*s.* a week in summer from butter, besides affording milk for the family." In another case the value of a cow to a family is estimated at 12*l.* a year upon an average, although in one favourable instance it amounted to 18*l.* (Evid. 216.) The whole character of the labouring population was said to be raised, and providence before marriage, in order to obtain this additional comfort, was very much increased by it. "But there is a caution," says one writer on the subject, "to be observed. Thrift and savings must in every case *precede* the grant of land, or the most "fatal consequences may ensue. Idle labourers will endeavour to subsist on their cow and their wife's "labour, the district will become over populated for the demand of labour, wages will fall, and the "people will starve, as in Ireland; and the occasional loss of a cow, where there is no previous saving, "will bring ruin to the cottage home." On the Loton estate (Sir B. Leighton's) this caution is always observed, and to this may be attributed its success there. The holdings are never let to any man who cannot produce a savings' bank book, and show that he has saved enough to occupy this amount of land. The result has been that almost all the labourers have a savings' bank book, and for every cottage with land attached which becomes vacant there are many applications. (Evid. 138.) One family, which had lost four cows in seven years, had still 10*l.* in the savings' bank. I would call your particular attention to the details of my visit to this estate. "Cow-gates."

178. The chief objection urged to the system is the amount of time for which the care of a cow withdraws a labourer from his ordinary employment. In almost all the cases brought under my notice, this amounted to three weeks or a month (Evid. 188); and though employers in Shropshire and Staffordshire are divided in opinion as to the necessity for this, and also as to the extent to which it interferes with a man's efficiency, in most counties such an amount of absence would at once stamp a labourer as irregular. Besides this, the occupiers of such plots neglect the education of their children far more than ordinary labourers, especially where they send their cow out into the lanes, or keep (as they often do) a small donkey cart. Bad farming too is the rule on all such occupations, and great care is needed to prevent any part from being ploughed up, because the whole object is not to create small farmers, but to encourage thrifty and efficient farm labourers.

179. A modification of this system which is common in Scotland, was observed by me in Cheshire, and on Mr. Dudgeon's farm in Sussex, and is that of giving regular labourers keep for a cow during the year, the animal being looked after by the regular herdsman of the farm. This appeared to me to comprise all the advantages of the system already noticed with none of its drawbacks. It is an equal encouragement to saving, and involves no loss of time to the labourer, no employment of his children, and requires no supervision. It renders unnecessary the subdivision of the grass land into very small fields, and the loss of space and the expense of fencing thereby caused. The gradual extension of such a plan to a limited number of deserving labourers in every parish, where it is possible, would be of the greatest value.

(D.) Other Circumstances Affecting the Condition of the Agricultural Labourer.

180. In the six counties forming the subject of the present report, the estimated weekly earnings of the labourer vary from 10*s.* or 11*s.* (everything included), to between 18*s.* and 20*s.* in the hop growing parts of Kent, the latter constituting an entirely exceptional district. Rate of wages.

181. But the condition of the agricultural population is affected not only by the rate of wages, but by *the mode of payment*, and above all other evils is part payment in beer or cider. Of course at harvest or other times of very hard work, men may require some additional stimulant, though they would certainly work better without it, but the system complained of is that of giving as a part of wages a certain number of pints of beer or cider every day. To the family it is actually an injury instead of a benefit, and it therefore appears most unfair to reckon this as any real addition to wages. In many cases where cider is given, it is actually a direct advantage to the employer to be able to dispose of the produce of his orchard. "The fact is," says Mr. T. D. Acland, (Journal Royal Agricultural Society, II. 750) "that the masters and men play into each others hands, the women and children "suffer, and the men too in the long run; the labourer in a year takes off his master's hands about "two hogsheads of cider, and satisfies one of his own bodily appetites at the cost of 15 per cent. of his "earnings. The liquor refreshes and stimulates him, but wears him out." In harvest time the amount of drink given is often almost unlimited, and a temptation thrown in the labourer's way, which it is hardly possible to expect him to resist. Mode of Payment of wages. (a.) Partly in beer or cider.

182. The best proof of the mischief of the system is that the counties where it prevails support nevertheless the largest proportion of beer and cider sellers. Mr. Baily Denton draws a comparison in this respect between Lincolnshire and Dorsetshire, and shows that in the latter, where the wages are only two-thirds of the wages of the northern county, the proportion of beer and cider sellers is 1 to 33 agricultural labourers, as compared with 1 to 40 labourers in Lincolnshire. (Evid. 73.) Many employers told me, and indeed it is an undisputed fact, that these labourers would be very unwilling to forego this privilege even for more than an equivalent in money. So degrading is the system that they prefer to expend in gratifying selfish appetites what ought to go towards the maintenance of the family; and after a certain time the labourer becomes so accustomed to it, that it would be very difficult if not impossible for him to dispense with it, and the mere promise of a little extra drink will induce him to undertake work that money would not make him willing to perform. The following anecdote illustrates the dominion

G. which drink can thus obtain over a man's mind. A labourer having earned at a piece of task work a considerable sum of money, left off for several days, and during that time was incessantly drinking. One morning, after all his money was expended, he set off to resume his work at a distance of three miles from his home. On reaching the place, he took off his coat and threw it on the ground, but as it fell, a forgotten sixpence dropped out of the pocket, upon which he put it on again, and walked back the three miles to finish the sixpence before he would begin work.

183. A last objection to the system is that it often extends to the women and children also. On many farms in Dorset and Salop a large proportion of the whole outgoing for labour is paid in this way, the women and boys receiving it in proportion to their money wages, and thus the latter are taught from the outset of life to require during work the stimulus of drink.

(b.) Part payment in kind.

184. Of the part payment of wages in kind I have already spoken. Excellent as the system may be in good hands as tending to correct in some degree the hardship arising from the constant fluctuation in the money value of wages, it is objectionable mainly on the ground that from its onesidedness it is liable to abuse, and is often abused. I allude especially to the "perquisite" system prevailing in Dorset and parts of Shropshire, which leaves the labourer practically at the mercy of his employer, but also to the payment of extra time in food, and to the plan, often adopted in Cheshire and Shropshire, of giving a married man all his food in the farm-house, and a sum in money varying from 7*s.* to 5*s.* per week. All such plans introduce an element of uncertainty into the contract between master and man, and by making the labourer too much dependent on charity, impair his independence. And as to the last mode of payment it may be added that "it can never be a good thing to separate the husband and father "from his family at meal-times; to do so must tend to destroy union of effort on the part of man and "wife to provide for the wants of the family." (Evid. 161.) The man probably gains at the expense of his family.

(c.) At long intervals.

185. Part payment in kind is still more objectionable, when combined with an irregular date for payment. There is much to be said against a fortnightly system, as tending to drive the men into debt, but far more against the monthly payment, often adopted in the counties of Dorset and Salop. They are even not always paid at any regular interval. Some landowners themselves are setting the very bad example of paying at irregular intervals of many weeks, during which time the labourer is left to live upon credit.

Extra earnings of summer supply, defects in winter.

186. Much is said, and especially in Dorset, of the extra wages earned at piece-work. A skilled man will no doubt deserve, and obtain exceptional remuneration, but as to the mass of the agricultural labourers their piece-work (if they have any) is limited to the summer, and frequently to the hay and corn harvest. Too often it is the case, as described by one witness, "that the labourer's winter income "is too little to meet his winter wants, and he is obliged to mortgage, so to speak, his summer wages." (Evid. 73.) Out of the harvest or other extra earnings the boot bill is paid. This difficulty will always be found to be in the way of the successful establishment of co-operative stores, while wages continue as low as at present. All the labourers are ready to go there in summer, when they have money, but in the winter they are obliged to resort again to dealers who are willing to give credit.

The pig.

187. In the same way the pig of the agricultural labourer is practically "mortgaged." The greater part of it is sold, or returned to the farmer in payment of its original cost before fattening, and the instances are comparatively rare in the low-wage counties, where he is able to eat the whole of it himself. In many cases, and far more often than is generally supposed, his employer will not allow him to keep a pig at all. And this proves a loss to him, not only in the value of the meat for eating, or for conversion into cash, but as depriving him of a means of utilizing all refuse, and securing adequate manure for his garden.

Diet.

188. There can be no doubt that in the greater part of these counties the labourers are sadly underfed, especially when not allowed to keep a pig. In such a case, unless their earnings very far exceed the usual average, even those men who are most regularly employed have to be content with a diet which consists almost entirely of bread, potatoes, and cheese. The wife of a Dorset shepherd in regular work thus described her food to me:—"We don't have a bit of butcher's meat not for half a year; we live on "potatoes, bread, and pig-meat, and are very thankful if we can get a bit of pig-meat; we often sit "down to dry bread. For harvest dinner we send out some boiled potatoes, a bit of cabbage, and "we put a bit of fat to the potatoes." (Evid. 10.) A family with three children earning, and "who "have never had sixpence from the parish," "buy a little pig-meat; we use it with the potatoes, we "don't have a dish of pig by itself; at harvest we eat some cheese, but not at any other time. We "don't often get potatoes." (Evid. 11.) "Their diet is bread and cheese and potatoes, with a little "bacon in the families that are best off. But for the last few years pigs have not been so common." (Evid. 20.) And this is in a county, in parts of which, "fuel is so scarce that the families as a rule "never have a fire, except at meal-times, even in the depth of winter." (Evid. 20.)

189. As I went north, the greatest difference to be noted in the condition of the agricultural population was the increased comfort afforded them by the greater cheapness of fuel: yet even in Cheshire "hardly any labourers eat meat at home, though some few can afford a little occasionally on Sunday. "Potatoes with butter milk if they can get it, is the ordinary food; sometimes a little bacon as a "luxury. Where a labourer's wife takes his dinner to him, it is then either hot potatoes in a covered "basin, or else gruel thickened with a little treacle or sugar." (Evid. 156.) In Shropshire again the wife of a waggoner in constant employment was last year "four months without any bacon or meat "because the pig had been a little one. We had nothing but potatoes and salt, bread and water." (Evid. 180, a.), and another had her "pigstie out of repair, and so killed no pig at Christmas; will have "to do without bacon this year." (Evid. 180, b.) In one Staffordshire village the diet of the labourer "is almost wholly bread, cheese, and potatoes; they never eat butchers' meat, and many of them get "no bacon. But what I think they miss most of all is milk, which cannot be got, and is a great loss "to young children."* (Evid. 204.)

* At St. Giles (Dorset), by Lord Shaftesbury's influence, a "parish cow" is kept, by which means all can buy milk at a reasonable rate.

G.

190. The diet above described is that which falls to the lot of the family of a hard-working and industrious man, who is not in the habit of frequenting a public house. And my inquiry leads me to the conclusion that drunkenness is considerably on the decrease in rural districts, and that it is not so common among regular farm labourers as it is usually represented to be. The places where this "most frightful source of poverty and demoralization" is most complained of are the large open villages, in which men are not always in regular work, their cottages are miserable and unattractive, and the number of beerhouses is out of all proportion to the population. Excessive competition in the trade, it is generally said, leads to the increase of drunkenness, and this report would be incomplete, if I did not call your particular attention to the feeling which everywhere exists as to the necessity of limiting the number of beerhouses, of obtaining more control over them, and of transferring their supervision to some more competent authority. Beerhouses.

191. For my own part I look with far more confidence to the effect which will be produced by an improvement in the condition of the cottages, in enabling them to compete in attractiveness with the warm and well-lighted public house. I say their *condition*, because some believe that this object can best be achieved by a change in their *situation*, that is, by placing them on the farms, where the man is further removed from temptation. In the same way other landowners have endeavoured to check the evil by not permitting any public house to be opened in the village of which they are the sole proprietors. I cannot speak very highly of the success of these attempts. A drunkard will drink in spite of the trifling obstacle of distance, and considerable hardship is caused to others, who are charged an exorbitant price for the poisonous liquor which is sold to them as beer.

192. One circumstance which above all others gives encouragement to drinking habits is the feeling so common in rural dictricts that no business can be done except over a pot of beer.* In some places where a man enters into a contract with his employer to do some 'piece work,' he expects a drink to cement the bargain. So again, when he goes to the monthly meeting of his club, to make his regular payment, he must drink. When he goes to the "statute" or "mop" fairs to be hired for the year, he drinks every day, and spends a great part of his yearly earnings.

193. The drunkenness at these fairs is the main cause of the immorality which is said to prevail at them. There is something very degrading also in the fact of young men and women standing in the market place to be looked over like so many cattle by the farmers who come to hire them. There is this further truth in the comparison that they are hired from their physical appearance, and very rarely from their previous character. And though in some places a room has been provided for the women to sit in under some respectable supervision, it is not easy to induce them to relinquish the licence they had previously enjoyed at their only holiday in the year. "Mop fairs."

194. And before passing on to consider the question which, of all connected with the agricultural labourer, is the most perplexing—that of "yearly hiring"—I am anxious to separate from it that of the "statute" fair. It is a consequence—but by no means a necessary one—of the system of yearly hiring; and therefore it is no condemnation of the latter to say that there is nothing more degrading to the agricultural population than the "statute" fair. I have observed that it is not a necessary evil. In Cheshire, where yearly hiring is common, fairs have been abolished; in other cases register offices have been substituted with some success in spite of the opposition of employers. And it is an evil which appears to me to call loudly for the intervention of the legislature.

195. It is sometimes urged that, if these fairs were abolished, the opportunity of meeting together, dancing, and drinking, would still induce farm servants to spend their annual holiday in the market towns; and further, that it is a great advantage both to employer and employed to look at each other, before entering into so long an engagement. These considerations, however, do not touch the main question, Why are agricultural to be hired in a different way from any other servants? In other cases hiring by character, with all its imperfections, is found to be the most convenient and satisfactory mode, and it remains still to be shown in what way (if any) it is inapplicable to the farm servant.

196. I have met with the system of yearly hiring not only in the East of England, but also in parts of Shropshire and Dorsetshire. The agreement is usually made, as has been pointed out, at the statute fair, and is hardly ever in writing, but a shilling passes as "fastening" money, as soon as it is entered into. Some of the ignorant labourers of South Shropshire are even now consenting to such engagements without any definite agreement as to remuneration or as to the amount of work to be required of them. The hiring is for fifty-one weeks, the remaining one being compulsorily kept as a holiday,† and the men usually change places every year. Some masters, no doubt, employ the same servants year after year, but the ordinary result of the system is a constant change, which prevents the families from being easily brought within the influence of the clergyman, and interferes with the education of the children. Many of the clergy complain that the greater part of their parishioners change every year. "A kind of vagrant population is created, who lose all home ties." Yearly hiring.

197. A far greater objection is that character is seldom, if ever, taken into account. Mr. G. W. Latham puts this very forcibly:—

"There is no incentive to any well-doing, character becomes valueless, and so long as the year can be scraped through somehow, master does not care to attach servant to him, nor servant to please his master: as long as a case for the interference of the magistrate does not exist, the two must go on together." (Evid. 154.)

Cheshire in fact furnishes the strongest possible instance of this. The dairymaids are hired because they can make good cheese, and the immorality so prevalent among them is no hindrance to their obtaining a situation.

198. Again, it is a one-sided arrangement. Payment is almost always partly in money and partly in kind, the latter mode of payment introducing, as I have already pointed out, an element of uncertainty and leaving the labourer too much at the mercy of the employer. In North Lincolnshire I heard few complaints of this, which may be attributed to the far greater independence of the labouring class in

* This feeling is far too common even in a higher class of life. In Cheshire and Shropshire, where many farms are small, and the occupiers little raised above the labourer, this habit is grievously complained of. The drunkenness on market day is lamentable.

† Great complaint is made of the overcrowding of cottages in the Christmas and holiday week, when all the members of a family return home to visit their relations.

G.

that county, than in the south or west of England. In Dorsetshire and Shropshire on the contrary, it is said that injustice arises not only from the inferiority of the food supplied in part payment, but sometimes also from the increased amount of labour exacted from the man, or from his wife and children.

199. On the other hand the system has great and undoubted advantages. One of the principal hardships affecting the agricultural population is uncertainty of employment, and anything which tends to mitigate this is to be welcomed. Yearly hiring secures to the labourer regular work at a rate to which he himself has agreed, and a maintenance if sick. It prevents a chance of his having to "flit" (leave his cottage and garden) at a short notice. To the employer also it secures a certainty of labour at all times of the year. So important are these considerations that they appear to me to counterbalance, in good hands, the disadvantages of the system. But from the class of farmer still existing, and the want of independence among the labouring class in many parts of the south and west of England, it appears to me that the time has not yet come for its adoption in those districts. And in all cases a written agreement should be adopted, without which there is no security to the labourer that its terms will be properly carried out.

Want of independence in labouring class.

200. Within recent times the enclosure of commons, and the enlargement of farms have very much increased the difficulty which the agricultural labourer experiences in getting a piece of land for occupation, or in raising himself above the condition of a hired labourer. He has nothing to look forward to; no hope, as he would have in following any other occupation, of bettering his position. To this may probably be attributed the increasing want of independence which is everywhere complained of in these counties. "One never hears now what was six years ago frequently said to me, "'I brought up a large family and never troubled the parish in my life.' The poor are every day "coming to look upon *relief as their right.*" (Evid. 31.) "I am quite satisfied of one thing," says Lord S. G. Osborne, "that be the wages what they may, it is generally admitted and acted on that "good labourers, the best of them, are ever on the verge of pauperism." (Evid. 4.) "The least illness, "the confinement of the wife, or anything of that sort, sends many of them to the parish for relief." (Evid. 86.) "A labourer who is ill one day, or whose child is sick, as a matter of course, applies for the parish doctor, and a week's illness always sends him to the parish." (Evid. 178.) "Every "labourer that is ill in my district," says a Dorset relieving officer, "comes for the parish doctor. "Before they have been ill a week, they come for relief in most cases." (Evid. 70.) Much evidence might be quoted to the same effect, proving also how little shame is felt at the loss of independence which is involved.

Partly due to rottenness of "benefit societies."

201. Another cause of the decreased providence among the labouring class is to be found in the rottenness of most friendly societies. The confidence of the poor has been to a great extent shaken by the failure of the club on which they or their father have relied. In hundreds of cases, after years of patient self-denial, and saving against a day of trouble, the poor labourer has been sent on the parish, because there is nothing "in the box of his club," or because, as he and others were getting old and were likely soon to come upon its funds, the younger members of his club have dissolved it, and re-constituted it without him. More often again he is the victim of mismanagement. The money is carried off by a treasurer, whom the law in many cases cannot touch; or that which ought solely to be kept for the future requirements of sick pay, is spent upon the temporary enjoyments of the annual feast. Or else the poor ignorant man is ruined by a miscalculation. How is he to know that the monthly sum he is called upon to contribute is utterly inadequate to enable the society to fulfil the expectations it holds out? There is no one to tell him so, his neighbours are joining, and he is led to begin a sacrifice which from the first is certain to prove useless.

202. And who is to blame for this? it may be asked. It may be answered unhesitatingly that the clergy and the landowners have a great deal to answer for in this respect. On the annual feast day of a club the proceedings commence by the members going in procession to church. The clergyman of the parish is asked to preach a sermon, and is threatened in the event of his refusal with the transfer of the place of worship to the dissenting chapel. In very few cases is he firm enough to resist this pressure, and generally he not only preaches, but, in the absence of the chief landowner, presides at the dinner. Neither of them, although they subscribe to the funds, know anything, except what they are told, of the state of the funds of the club, or of its real security; but the apparent sanction which they give to its proceedings induces many men to become members without any further inquiry.

Necessity for encouraging them.

203. It may at once be admitted that a man receiving only 10*s.* a week in wages can ill afford to pay the contribution which a solvent sick club would require of him, and still less to provide for his old age, and, therefore that a large number of agricultural labourers must continue, until wages rise, to look upon the poor rate as a fund to assist in their ultimate maintenance, even if they are not obliged to rely upon it in sickness. Yet if the value of the friendly society in raising the moral and social condition of the labouring class, and in effecting a most important reduction in the poor rate (estimated at two millions), be remembered, no one can doubt that every encouragement should be given to men who are anxious to join them, and to their formation on a trustworthy system.

204. Several local attempts have been made within my district with this object. The County of Kent Friendly Society (which expends upon management only 7½ per cent. of its income) was one of the first to offer the advantages of a really sound club, and now numbers 950 members. In Dorsetshire, Shropshire, and Rutland also, similar county institutions have been formed on an equally sound basis, that in the first named county being the most successful. It is much to be regretted that hitherto these clubs have made way among the class of servants rather than the very poor.

Difficulties of sound clubs.

205. The fact is that before gaining ground in an agricultural district, these sound benefit clubs have many difficulties to contend with. They generally involve a higher rate of payment, and discountenance meeting at public-houses, in which opinion most of the clergy express their concurrence. It appears to me, however, doubtful whether so sweeping a change would be successful. To most labourers the display and the annual feast, and the monthly meeting at the public-house * constitute a great

* I am afraid I must add that the loose rules of uncertified clubs often constitute an attraction. I even found men in a superior class, such as schoolmasters, preferring to join clubs in which the expenses of the annual feast were paid out of the reserve funds, or where under a system of dividing out, they got back something every year. The following is an instance of the expenses paid on a

inducement to join the club, and the advantage resulting to them from becoming members of a benefit society is so great that no discouragement, such as would be involved in the general removal of clubs from public-houses, should be offered; nor could it be justified on other grounds. The best proof of the attraction afforded by the display of some clubs is the great progress made by the Foresters and Odd Fellows, especially in Staffordshire, Cheshire, and Kent.

206. A further discouragement to joining any benefit club is to be found in the present administration of the poor law. "Many industrious and deserving labourers appear to be discouraged from "making the effort to secure independence by self-help, from the fear of losing their presumed right "to relief from the poor rate" (Evid. 228.) It is utterly uncertain in what way boards of guardians will deal with such a case. Some never recognize, in giving relief, the fact of a man belonging to a club; others do take it into consideration, and some refuse relief altogether. More often they are guided by no fixed and uniform rule. In some parts the labourers are said "to have framed "their clubs with special reference to additional help from the rate". (Evid. 228). It is most surprising that the question, which yields to no other in importance—What is the best way of administering out-door relief so as to give encouragement to provident habits? is not only not answered by an authoritative interpretation of the principle which should govern such cases, but is actually left to be answered by each board of guardians for itself.

Necessity of further inquiry.

207. All the evidence appears to me to lead to the conclusion that to ascertain the principle which ought to be recognized in such cases, and the most effective means of offering encouragement to the formation of sound clubs an inquiry is imperatively needed. And on the present generation a no less important benefit would be conferred by a consideration of the condition of existing friendly societies. Rotten clubs are sheltering themselves under the protection of Mr. Tidd Pratt's certificate of registration, and availing themselves of the attraction with which this sham security invests them. But besides these certified clubs, it must be remembered that there is an enormous number utterly unrecognized by law, under no restrictions as to management, and whose financial condition is unknown. In the parishes in Kent where I made special inquiry on the subject, I found the proportion of uncertified to certified societies to be as three to two. And there are further questions well deserving consideration, such as that most ably advocated by the Rev. J. Y. Stratton (Evid. 228), whether a system of friendly societies might not be organized through the agency of the post office, just as annuities and sums payable at death can now be secured by it. For all these purposes a more searching inquiry than was possible under my present instructions appears most desirable.

Combinations in the nature of "Trades Unions."

208. In a few instances I have met with attempts at combination among agricultural labourers for other purposes. When machinery was first introduced into farm operations, combinations were frequently formed, but without much success, to resist it; and even now, in busy times of thrashing, strikes for an increase of wages are not uncommon in Lincolnshire. I refer, however, more especially to two instances of combination. The first was on the heath south of Lincoln, where the bad distribution of cottages compels many men to walk a long distance to work. Unions were formed and supported for some months by subscriptions, with the object of reducing the hours of work in consequence of the long distance to be traversed to it. This, however, came to an end without effecting its purpose.

209. The second case occurred in the neighbourhood of Maidstone. In May 1866, the Kent Agricultural Labourers Protection Association was formed in order "to organize the agricultural "labourers with the view to the amelioration of their social condition and moral elevation, and to "endeavour to mitigate the evils of their serfdom." At that time labour was scarce, and the first effort of the association was directed to obtaining an increase of wages; and in fact it was mainly by means of this organization that a general rise was shortly afterwards effected. As labour again became more abundant, the employers obtained more control over their men, and the result has been that the association has ceased to have any influence whatever. It is difficult to ascertain what were regarded by it as the principal steps in the amelioration of their condition. But curiously enough the one thing especially desired for them by everyone who takes an interest in them, that is, the improvement of their cottages, was not an object of this association, because they all felt that improved cottages enabled the employer to obtain more control over his men.

210. I have now, as I believe, gone through all the points immediately connected with the subject, upon which it was necessary for me to touch, but I cannot conclude this report without a strong expression of opinion that the moral and intellectual elevation of the employers themselves is after all the chief means by which the condition of the agricultural population may be ameliorated. The ignorance and narrow-mindedness of employers is still very much complained of, and the feeling of the Loppington (Salop) farmers, who sought to retain their position not by improving themselves, but by keeping down their labourers, though not openly expressed elsewhere, is by no means limited to that parish.

211. Nor can I conclude without a word of thanks to the many gentlemen, who in the course of my extended tour, have received me with courtesy, kindness, and hospitality. To their assistance and co-operation in the objects of the inquiry I owe a deep debt of gratitude.

I have the honour to be,
Gentlemen,
Your obedient servant,
EDWARD STANHOPE.

10, King's Bench Walk, Temple, E.C.

General remarks and conclusion	48, 49

To Her Majesty's Commissioners.

Gentlemen,

H. I have now the honour to lay before you the results of the inquiry with which I have been charged in the counties of Hants, Devon, and Cornwall.

1. There being no gang system in existence in these counties, with the exception of the annual exodus of persons in considerable numbers from villages bordering on the hop district in Hants, and the occasional employment of a number of women and children for stone-picking (and these hardly come within the definition of a gang), I propose to place before you the main points of the evidence under the heads of—

1. General employment of women and children in agriculture.
2. The age at which children should be employed.
3. The education of agricultural children.
4. Cottages.

Mode of proceeding.

2. I have in the second part of this inquiry adopted a course of proceeding similar to that of the previous year, with the exception, perhaps, of having attended a larger number of public meetings in consequence of the increasing number of district chambers of agriculture and of the desire expressed by the members of them to discuss publicly a question so closely connected with their interests.

3. Out of 213 circulars of inquiries issued, 96 only have been returned to me, but, as on many occasions, those persons to whom they were sent, have attended meetings and expressed their opinions as well as given the desired information, those numbers do not convey an accurate notion of the assistance I have received from persons of influence to whom I applied. Throughout the district there was evinced a desire to aid me in my inquiry, with the exception of some instances in Devon, where a dislike to Government interference was manifested, and where I found some reluctance to afford the information for which I asked.

4. I have endeavoured as far as possible to obtain a just estimate of the real condition of the agricultural labourer, not only through the medium of his employer, or his minister, but also from the mouth of his wife, his children, and himself, and from the experience of the school teachers in many villages.

5. On the point to which Mr. Tufnell directed my attention, viz., the result of good schooling in removing the best men from the parish, I regret that it has been impossible to obtain direct statistical evidence. That the more intelligent among the agricultural labourers do migrate in search of higher wages is an undoubted fact to which many persons have borne witness, but it rarely or ever happens that you can find in a parish any record showing the position in later life of the lads who have been trained in the schools. I will in another part of my report call your attention to such statements as may throw any light on this point.

6. I have obtained the rules and reports of some of the best benefit societies in these counties, which I will set out in part. H.

7. Before going into the many points which come under the heads above-mentioned, I propose to give in detail the wages paid in the different parts of each county; as in Devon, more particularly, it is a question that has much occupied public attention lately, and on which conflicting statements have been made.

8. The northern division of the county of Hants contains in its centre a large, open and thinly populated district situated between Bishopstoke and Basingstoke, Alton, and Stockbridge, and joining the county of Wilts on the north of Andover. Throughout this portion of the division the farms are generally large. In the neighbourhood of Odiham, Hartley, and in a district called the Woodlands, to the north of Basingstoke, the holdings are much smaller, the country more closely wooded, the population greater, and I should say poorer. Hants.

9. The southern division comprises the New Forest, and the district surrounding the large towns of Southampton, Fareham, and Portsmouth, part of the valley of the Test, and the valley of the Avon on the borders of Wilts and Dorset.

10. The rate of wages in the large-farm district of the northern division, as shown by the evidence of those who met me at Lord Northbrook's (No. 3) is 10*s.* a week for an ordinary labourer and 1*s.* a day for a woman; children earning 6*d.* to 8*d.* a day when employed for bird-keeping. It was said that 15*s.* may be taken to be the average weekly earnings of a day labourer throughout the year, harvest pay and all privileges being reckoned. Wages.

11. At Kimpton, near Andover, also a large farm district, Mr. J. Fowler (No. 51), gives a statement of the wages paid by him, from which it appears that the ordinary labourer gets 10*s.* a week and pays 1*s.* for his cottage; carters and shepherds from 11*s.* to 12*s.* 6*d.* and a cottage free.

12. It may be taken as a rule that the carters and shepherds get 1*s.* a week more than the ordinary labourer, and in most instances a cottage free, but it must also be remembered that their hours of work are longer.

13. Mr. Fowler states, the total of wages paid on a farm of 1,000 acres (900 being arable), to be 812*l.* 16*s.*, about 16*s.* 3*d.* per acre; on a farm of 500 acres, 420*l.* a year.

14. In the district of Odiham and Heckfield, where the farms are smaller, a man's wages are 10*s.* and 11*s.* a week, all money, those of a woman, 8*d.* a day (Nos. 19, 21, 22). Boys get 2*s.* 6*d.* a week for bird-keeping.

15. There is in this part of the county much work to be had in the copses and in bark stripping, which is done by the piece.

16. Mr. Warner (No. 77) states, that in the neighbourhood of Botley wages for men are 11*s.* and 12*s.* a week, and a great deal of task-work, the women earning 10*d.* a day.

17. In the New Forest Union an ordinary labourer earns from 10*s.* to 12*s.* a week; a boy of 8 years of age would begin with 3*d.* a day rising to 2*s.* 6*d.* a week when 10 years old.

18. In the Fordingbridge district a man's wages are nominally 10*s.* a week, but Mr. Ridley stated that the men in his employ averaged from 13*s.* to 15*s.* a week through the year, including piece-work. (Vide Evid., No. 83).

19. Lads in farm service and employed with the cattle or as carter boys are hired by the year from Michaelmas, and get from 3*s.* 6*d.* to 4*s.* 6*d.* a week, according to age, when living at home. (Fowler, No. 51).

Those living in the farm houses get 4*s.* and 5*s.* a week and lodging, and 2*l.* 10*s.* at Michaelmas. (Mr. Tait, No. 22).

20. In Devon the wages question is one that has led to much controversy, not only on account of the directly opposite statements as to the amount earned, but also in consequence of the difficulty of ascertaining what is the real value of "the privileges" given in addition to a small weekly money payment. Devon. Wages.

21. I cannot do better than give some extracts from a paper entitled "Landowners, Land, and those "who Till it," written by the Rev. Canon Girdlestone. He says:—

"The following is a correct detailed account of the condition of an agricultural labourer in North Devon. Till within the last year the wages were seldom more than 8*s.*, in some cases only 7*s.* a week; 9*s.* a week are now usually given, though in some cases still only 8*s.* Each man has in addition his three pints or two quarts of cider a day. The horsekeeper and the shepherd have also a cottage and good garden rent free. In some cases also an agreement is made that the wages should be partly paid at a price per bushel fixed at the commencement of the hiring, in grist or tailing, being the wheat which is too small in grain to find purchasers in the market. This, when, wheat is very high, is an advantage to the labourer, but when wheat is low very much the reverse."

Again—

"Fuel is seldom supplied, except at a cost for getting it, by grubbing old hedges and such like, which is fully equal to its value. Potatoe ground is almost always paid for at a high rate."

"Women have 7*d.* or 8*d.* a day; this scarcely pays for wear and tear of clothes, and not at all for the consequent neglect of household duties, and in reality adds nothing to the welfare of a family. Many women are so well aware of this, as to decline out-door work, unless, as in some instances, which is a great hardship, forced to do it by the agreement between their husbands and the farmers, who in some cases will not give employment on any other conditions."

22. On the other hand, at a ploughing match dinner at Halberton on 28th October 1868, a farmer made the following statement:—

"The canon had said that the labourer earned 8*s.* or 9*s.* a week. Now he had gone through his labour book, and taken out the amount paid to one of his labourers from Lady Day 1867 to Lady Day 1868. Although

H. this man received nominally 8*s.* a week, he actually received, taking all the year round, 10*s.* a week in money and with grist-corn, convenience for pig and other things, he received as much as made up the wages to the value of 14*s.* a week."

23. Mr. Pearce, of Uploman (No. 114), the farmer who made the above statement, told me that the grist-corn is the same corn as that used by the farmer himself, the tailings being now used for the cattle. He further said that the wages of an ordinary labourer were 8*s.* a week and cider, of carters, &c. 10*s.* a week, &c.; that women earn 8*d.* a day with cider, or 9*d.* a day without it; and that a man can earn 12*s.* a week at task-work. Mary Arthurs, the wife of a labourer living in Uploman, said that her husband's wages were 9*s.* a week and cider, *no privileges, and rent to pay for his house.* A man named Ware (No. 118), in the same parish, who has worked as a regular man on a farm and as a jobber, says that the regular man in receipt of a small money payment, with the addition of privileges, is better off than the jobman at a higher rate of pay in money only. He doubts any labourer, except perhaps a shepherd, earning 14*s.* a week on an average.

24. The rate at Chettiscombe and Chevithorne, near Tiverton, paid by farmers (Nos. 136 and 146) is from 7*s.* a week up to 9*s.* for the best men, who with the carters get cottage and garden rent free, 20 yards of potatoe ground free, grist-corn at 5*s.* a bushel, and cider; women 8*d.* a day; boys of 13 or 14 years of age, 1*s.* 6*d.* a week, board and lodging. At Bampton for men the rate is 10*s.* a week in money, or 9*s.* and a cottage; for women 4*s.* a week; boys of 9 or 10 years 4*d.* to 6*d.* a day. At Kentisbury, in North Devon, wages for men are 12*s.* a week; for women and boys 5*s.* a week. At Morebath, Mr. Pine (No. 161) states that he gives a man 7*s.* a week, cottage and garden rent free, cider, 20 yards of potatoe ground, and bakes his bread for him; the man also has piecework.

25. Mr. Goodding (No. 162) considers that where the master is a good one the labourer with privileges is better off than if his wages were paid in full money. And he gives as his reason that if a man has his wages all in money, he must buy flour, &c. from the shop, and the tradesman has to make a living out of that money.

26. In the Budleigh and Honiton districts men's wages average 9*s.* a week with cider; women earn 8*d.* to 10*d.* a day; boys of 10 years of age 2*s.* a week. In the Honiton district the best men get by piecework 15*s.* and 16*s.* a week. In the Tavistock district, where, owing to the care of the Duke of Bedford, the condition of agricultural labourers is better than in many parts of the county, the wages for a man were stated to be 12*s.* a week (No. 92).

27. At Berry Pomeroy, for a man 11*s.* a week and cider, and 15 yards of potatoe ground dressed (No. 198).

28. In the Kingsbridge district, Distin, an agricultural labourer (No. 210) was in receipt of 10*s.* 6*d.* a week and cider; women earn 7*d.* a day.

29. Rev. A. Earle, from this neighbourhood, gives the following table of wages, which was submitted to several employers of labour, and in the main agreed to by them:—

	s.	*d.*
Weekly regular wage	10	0
Piecework, average per week	1	0
30*s.* for harvest, say	0	8
Privileges, *e.g.*, potatoe ground, straw, and house, say	0	6
Cider	1	4
	13	6

He adds, "*The employed have as a rule put a lower rate as the average.*"

30. In the district of Hatherleigh and Holsworthy, *i.e.*, the north-west portion of the county adjoining Cornwall, where as a rule the land is poor, the farms small, and the farmers not men of any capital, the wages of men are low, ranging from 8*s.* to 10*s.* a week; women earn 8*d.* a day.

31. I was told at Ashwater by Mrs. Tom (No. 271), wife of a farm labourer, that her husband earned 10*s.* a week, with no privileges, and paid 3*l.* 10*s.* a year for his cottage, and, to quote her own words, "sometimes a bit of piecework; us couldn't live if it was not for that."

32. At the meeting of the Devon and Cornwall Chamber of Agriculture, attended by representatives of both counties, it was stated that the wages of an ordinary labourer were 12*s.* a week and cider, and that 13*s.* a week might be fairly taken as a weekly average throughout the year.

Cornwall. Wages.

33. In the county of Cornwall the wages of the agricultural labourer vary according to the amount of competition that may be caused in the neighbourhood by mines, slate or granite works, or by the demands of the fishing season on the coast. There is but a small portion of this county that can be called purely agricultural. The small district west of Penzance and the north coast from Newquay to Camelford, are the best examples. Throughout the centre of the county is a backbone of moor, where quarrying, china clay works, and mines are in existence. I have confined my inquiries to those parts of the county where I was told the best information could be obtained; at the same time I have held meetings in places where the employment of the working class may be said to be mixed as at Lostwithiel (No. 297).

34. The rate of wages in East Cornwall (No. 288) is 12*s.* a week for a man, for a woman 8*d.* a day.

35. At Penzance, and in the district west of that town, 12*s.* a week is the rate for men; in some cases (Woollcombe, No. 311), 7*s.* and dinner, cottage and potatoe ground free.

36. In the Helston district from 10*s.* to 12*s.* a week for men, varying according to the proximity to the mines. A boy of 9 years of age would earn 2*d.* a day if hired by the day, or 1*s.* a week and meat if otherwise hired. Women 8*d.* a day.

37. In the northern part of the county the wages are not paid wholly in money; the grist-corn system is there said to be an advantage, owing to the distance in many cases of the labourer's home from a market. At St. Columb Minor 12*s.* a week for a man is the average rate if paid all in money. Women earn 8*d.* a day; children in stone picking 6*d.* a day. Mr. Liddell (No. 352) gives the wages for men at 10*s.* a week with grist-corn and potatoe ground; for women 7*d.* and 8*d.* a day; for children

6*d.* a day. Throughout the district of Wadebridge the same rate prevails for regular agricultural labourers. At Kilkhampton (Mr. Trickey, No. 364) wages are 10*s.* a week without cottage when all paid in money; 9*s.* a week with cottage, or in a few instances 8*s.* and corn. H.

38. I have gone rather fully into the details of wages in my district, as in considering the question of legislation as to the age at which a child should first be employed, it is well that you should have before you the actual earnings of the heads of the agricultural labourers' family, in order that you may justly estimate the statement so frequently made, that without the assistance of the children's earnings the family cannot be maintained, and that the wages of the bread-winner are not sufficient to enable him to spare the weekly payment for his children's schooling. Under the head of benefit societies I shall have occasion to refer again to this question in considering the possibility of saving money out of the present earnings of an agricultural labourer.

I.—General Employment of Women and Children in Agriculture.

39. The employment of women in Hants, as shown by the returns which Captain Forrest, the chief constable, most kindly obtained for me through his district superintendents, is universal. The work is for the most part weeding corn, picking stones off the land, which is frequently done at per load, picking couch grass, and spreading dung. In the winter they are occasionally employed in the barns, or with the thrashing machines. Children under 10 years of age are not much employed; some boys of 7 and 8 years of age are sent out to scare birds, or mind pigs, and are occasionally used for weeding and stone-picking. Girls are very seldom employed, except when taken out by their parents to help at piecework, or in getting up potatoes, as in the case of Mr. Longstaff's field, near Micheldever No. 45).

40. Lads of 10 years of age are taken into the permanent service of the farmer as carter boys; they are hired by the year from Michaelmas; they do not always live in the farm houses.

41. In Devon and Cornwall it was usually stated that the women are not so much employed as formerly, and that it is often difficult to get them when wanted. Lace-making in the Honiton district, and gloving in the district of Torrington, in Devon, occupy the women and girls at home. It appears, however, that when there is a demand for a number of hands for stone-picking, they are forthcoming of all ages and sizes; but this employment is only for a few weeks in the late spring and in fine weather. They are also much employed in apple picking. With these exceptions it is rare to find a girl employed in the fields, and the testimony of women who have been themselves field workers is that such work is bad for girls, and that they would never send out their own.

42. Mrs. Nevill (No. 34) says: Field work not good for girls.

"I got no good by it, as I had to pay some one to look after the house and children, and things wasn't done, and the wear of clothes was great."

43. It is the opinion of many that the agricultural labourer would be better off if his wife stayed at home. Mr. Poore, agent to the Marquis of Winchester, goes so far as to say that the majority of the farmers in Amport parish agree with him that it would be beneficial, if practicable, to prohibit female labour in the fields altogether. Opinions differ as to the effect of the wife's work on the tidiness or otherwise of the home; but I am still inclined to adhere to the opinion which I expressed in my first Report, S. 32, that the employment of women in the fields does lead to a want of care at home, and to a neglect of the best interests of the family. Or for women.

44. There are, however, cases where a prohibition of all female labour in the fields would fall hardly, *e.g.*, in the case of widows with one or more children, and in the case of those young women with illegitimate children who are debarred by their misfortune from obtaining places as domestic servants in respectable families.

54. The evidence does not show that, as a rule, much injury to the health is caused by field work, either in the case of women or children. Exposure to wet may sometimes produce ill effects, more particularly in the case of young women, and it has been urged that girls should not be allowed to work in the fields till they have passed the age of 16 on the ground of health. Effect on health.

I think, however, that except when bird-keeping or doing such like work small children are not exposed to wet weather.

46. As to the effect of field work on morality, I am inclined to agree with Rev. R. Wolfe (No. 187), who stated it as his opinion that immorality is taken to the fields and not engendered *in* the field. On morals.

47. There being no gang system in these western counties, and consequently none of the evils attendant on the gathering together of large numbers of women and girls, or on the licentiousness of a gang-master, who has the girls in his power, it seems that with the exception of haytime and harvest there is no period in the year when the circumstances of employment would lead to immorality. We must look elsewhere for the cause; to the crowded cottages in the first instance, and too often to the want of care in domestic service.

48. At the same time there is every reason to believe that a habit of field work is bad for girls, as leading to a love of liberty in the evenings and to a dislike of the restraints of domestic service. Rev. J. O. Gifford says, "The less employment of women and female children in field labour the better. The older and worse conducted women injure the younger and purer." It is then satisfactory to find from the evidence obtained in these counties that the employment of women in the fields is gradually dying out.

49. It does not appear that there is need for placing any restriction on the hours of work or on the distance which children go to their work. Hours of work and distance to work.

50. The hours of work are seven or eight. No cases of hardship or over-working have come under my notice, with the exception of the long hours for bird-keeping in wet and fine weather for boys of 8 years old. In two cases at Halberton the hours for such boys were 5 a.m. to 6 p.m. and 4 a.m. to 8 p.m. The general testimony is that the labourers are, as a rule, kindly treated, though not overpaid.

51. Women are largely employed in the market gardens near Penzance; children also, as young as 7 years, who work from 6 a.m. to 6 p.m. (No. 300 Gulval). They all work together in a "company," Market gardens; Gulval.

H. but there is no gang-master; the heavy work is done by the men, light work by the women. A few labourers will agree together for a "take;" they all consider themselves parties to the contract. Men and women have separate "takes." They rarely mix, and men do not employ women (No. 304, Mr. Thomas).

II.—Age at which Children should be Employed.

Application of Factory Acts to agriculture.

52. The next question is whether it is desirable or practicable to apply to agricultural labour the principles of the Factory Acts with regard to the age at which children should commence work. As I have already stated, the evidence does not show that, with the exception of the hours for bird-keeping, any need exists for legislative enactments for the protection of the young or of females from ill-treatment or excessive labour. It is, therefore, merely a question how far the education of the agricultural labouring class is affected by the early employment of children, and at what age they should commence work, taking into consideration not only the interests of the employer, but more especially those of the labourer himself.

Need only on ground of education.

Age below which children should not be employed.

53. Throughout my district, with the exception of the New Forest Union, in Hants, where it was thought that children might commence work at 8 years of age, the age of 10 was considered to be the right one to be fixed as that below which children should not be permitted to work in the fields. The general feeling in Devon was that up to 10 years Government might make such regulations as they thought fit, but that above that age no interference was at all necessary in the matter of labour. I was constantly told in that county, both at public meetings and in private, that with them no interference was needed; but I beg most distinctly to differ from that opinion, inasmuch as the state of education is most lamentably deficient throughout the agricultural community. It is to a certain extent true that except at special seasons, there is not much employment of young children in Devon, and the apathy and indifference about education are therefore all the more to be deplored.

Opinions in Hants.

54. At the meetings of the Hants Chamber of Agriculture, at Basingstoke and at Winchester, it was resolved that it is not expedient to employ boys under 10, or girls under 13 years of age. At Fordingbridge that boys should not be employed under 10 years. At the New Forest Board of Guardians that 8 years would be the proper limit to fix. At a meeting at Mr. Fowler's house, at Kimpton, near Andover, it was said that no boy should be employed under 10 years of age.

In Devon.

55. In Devon, at a large meeting at Tavistock, it was resolved that children should not be employed under 10 years of age. At the Devon Chamber of Agriculture meeting at Exeter in October 1868, many of the speakers considered 10 years as a sufficiently early age for children to commence work, though at the same time the Chamber deprecated Government interference in the matter.

56. At Kingsbridge it was the unanimous opinion of a meeting of the Chamber of Agriculture that boys should not commence work before 10 years, nor girls before 13 years of age.

57. At Newton Abbot Board of Guardians it was resolved that no boy should be allowed to work in the fields under 10 years of age, nor any girl under 16 years in the fields or in outdoor work.

At Plymouth.

58. At a meeting of the Devon and Cornwall Chamber of Agriculture, held at Plymouth, it was resolved that no legislative restriction on the age at which women and children are employed in agriculture is necessary in Devon and Cornwall, the opinion of the meeting being that Government should not interfere with the work of children after 10 years of age.

In Cornwall.

59. At a meeting at Lostwithiel, where the mining element as well as the agricultural was represented, it was the opinion that boys under 10 years of age should not be employed in agricultural labour, but that at the same time there might be cases in which legislation on the matter might cause hardship to the poor. The meeting was not in favour of any legislative interference at present; it was thought that with the existing facilities for education in that district labour and schooling might be combined during the earlier portion of the labourer's life.

60. At St. Colomb, at a large meeting of the North Coast agriculturists, it was resolved that it is not desirable that children under 10 years of age should be constantly employed in agricultural pursuits.

Rule in unions.

61. In many unions in the counties of Devon and Cornwall I found that it is the custom to withdraw out-door relief from children of 10 years of age, in some not till 11 or 12 years, as it is then considered that they are able to earn something. The rule is not a strict one, but in the case of strong healthy children it is usually enforced. The agricultural employer being fully represented on all County Boards of Guardians, it may, I think, be fairly assumed that, if they have themselves fixed on 10 years as the lowest age at which children should begin work if their health permits, there is a good reason for such a limit being adopted by the Government should it propose any legislation on the subject.

Opinion of farmers as to effect of such limit.

62. It was generally the opinion of farmers that legislative interference as to the age at which children should commence work would not affect them, 10 years being the limit, but that if any hardship was caused by it, it would be to the head of the labourer's family, in consequence of the loss of the children's earnings.

63. It seems that owing to the more general use of machinery in agriculture, and in consequence of an altered system of driving horses in plough and harrow, boys under 10 are not in such demand as they formerly were. They used to be employed to look after the leader of the team, whereas now the horses are driven with reins by the ploughman. In some of the hilly parts of Devon there is still occasional employment for a boy, with a spare horse to help the load up the hill.

Work for boys under 10, and wages.

64. There remains then the work of bird-keeping, pig-tenting, stone-picking, and potatoeing, sometimes of singling turnips behind a man, which can be done by a small boy under 10 years of age. And for these operations what are the wages? From 4*d.* to 6*d.* a day, in some cases only 3*d.* a day.

Will the loss of earnings of children under 10 years be felt by the labourer.

65. Will the loss of such earnings as these be really felt by the labourer when the clothes bill is considered? I give one piece of evidence taken from the lips of a girl (Sarah Roe) 11 years old in Chevithorne School, near Tiverton. "I went out stone-picking with mother at 8 years old. I was out "a month, and earned 6*s.* I wore out a pair of *new* boots in the time, they cost 6*s.* 6*d.*" Her father is an agricultural labourer, earning 7*s.* a week, with five children at home.

66. A few extracts from the evidence giving opinions on this point may be of service.—

The schoolmasters at Milton Green, and Gulworthy, near Tavistock, state:—

"That the gain to the families by the earnings of children under 10 years is imaginary, the cost of wear and tear of clothes, exceeding the incomings."

Rev. T. G. Clarke, of Odiham, says:—

"A limit of age for commencement of field work would be opposed by the farmers, and objected to by the labourers on account of the loss of earnings, and the parents would not send their children to school any the more, if prevented from sending them to work."

Mr. Eggar, steward to Sir H. Mildmay, thinks:—

"The loss to the parents would be very trifling."

Mr. Tait (Lord Eversley's steward), says:—

"The loss of earnings of children under 10 years of age would not be of any consequence to the parents."

Mr. Mark White, farmer (No. 23), says:—

"The earnings of little boys under 10 years of age, in the case of a large family of an able-bodied man, are in my opinion a very great consideration and assistance."

Mr. Adnam, of Stratton (an old man who commenced life as a shepherd boy), says:—

"I think 10 years would be a good age at which to fix the limit for work, and the loss of earnings under that age would not be serious to the parents."

Mr. Potter (schoolmaster for 52 years in Stratton), says:—

"The question of a restriction as to the age for commencing work is really a question of earnings, the 1*s.* 6*d.* or 2*s.* a week against the schooling. I do not think the parents would lose as much as they think by the stoppage of the children's earnings. The labourers *might* object to the Government controlling their children."

John Matthews, a carter at Kimpton, thinks:—

"It would be hard to keep children from work till they were 10 years old. Though the earnings are hardly "more than the wear of clothes, still they are glad of the money;" he adds, "my eldest boy began work at "6 years, *he cannot write, and can only read a little.*"

Mr. Geo. Morrice says:—

"That one of his labourers, with a family of six children, insisted on his employing the boys in preference to their being sent to school."

Effect of early labour on education.

67. The effect of the withdrawal from school of children at a tender age, even for the few weeks during which they may be employed, is said by school teachers to be, that they not only lose much they had previously learnt, but also that they become rough in their manners, and less subject to discipline than when in regular attendance.

68. Miss Strickland, mistress of the Micheldever Girls' School, says:—

"That children who go to field work lose much of the knowledge previously acquired, and in some instances do not regain their former place in the school for nearly six months."

69. Tallach, an agricultural labourer at Budock, in Cornwall (No. 336, says:—

"My children began work at 7 or 8 years of age. I should have liked to have kept them at school, they forget what they have learnt very soon when they have left it; there is no occupation to make them keep up their education. They are all the better for it, and are qualified for better occupations than without it."

Benefit of education in securing better wages.

70. On the other hand, in accordance with your instructions, I have endeavoured to obtain evidence as to the result of good schooling, in removing those who have profited by it to a higher sphere than that of an agricultural labourer; and though, as I have before said, direct proof is difficult to obtain, still it is clear that the best educated lads do go into the police, to the railways, and into the towns where they can command a higher price for the services which their education makes them capable of rendering. The case of Abbott's Ann parish, in Hants, where the Hon. and Rev. S. Best has for years past maintained a very high-class school, and given a course of education above the ordinary run of country schools is a good example.

Mr. Parsons, a farmer in that parish (No. 52), says:—

"Farmers in Abbotts' Ann cannot get carter lads in the parish, and are forced to seek them elsewhere, as those in Abbott's Ann are too highly educated for agricultural labour, and go away from the parish."

Rev. T. G. Clarke (No. 19), says:—

"Young men who have had some education go off into the police and to other employments not agricultural."

Mr. Stoneman, a farmer at Morebath in North Devon (No. 160), says:—

"That the best young men, *i.e.*, those who are the best educated, go away to the police, railways, &c.

3.—Education.

The state of education not such as is desirable.

71. Throughout my district I have put the question, is the state of education among the labourers such as you would desire? And I believe I may fairly say that it is admitted not to be so, though great progress has been made in late years, and it is said that the labourers are beginning to realize how great a loss to themselves is the want of education, and consequently are becoming more anxious about sending their children to school as long as they can afford to do so. This remark applies more to the better class of labourers, for there is unfortunately too large a number who are utterly indifferent about it, not only in the towns, but also in the small rural villages.

Mortality and marriages. Par. paper.

72. I have before me a parliamentary paper, entitled "Mortality and Marriages," dated 13th July 1867, which was moved for by Mr. Hastings Russell, and to which Lord Fortescue referred in his speech at the Devon Chamber of Agriculture, at Exeter, in October last. I have some doubt whether it can be taken as accurate evidence of the state of education; but I subjoin extracts relating to Hants,

Devon, and Cornwall from a table, showing the proportional numbers per cent. of marriages of men and women that signed the marriage register with marks in 1855 and 1865:—

	1855.		1865.	
	Men.	Women.	Men.	Women.
Hants - -	26·3	29·2	17·3	16·2
Devon - -	27·1	33	18	22·5
Cornwall - -	35·6	49·3	30·2	38·4

The numbers for Yorkshire and Cambridgeshire are:—

	1855.		1865.	
	Men.	Women.	Men.	Women.
Cambridgeshire -	40·3	42·6	31·3	27·1
Yorkshire—				
West Riding -	28·8	50·8	22·3	41·3
East Riding -	20·6	34	17·9	26·2
North Riding -	20·9	31·4	17·4	21·9

These numbers show at any rate that a certain progress in writing has taken place, and it may be fairly concluded that more attention has during those 10 years been paid to the education of the young. There is much, however, yet to be done, especially in Devon, before you can say that even a fair amount of elementary education is given generally throughout the country.

Causes of defective state of education.

73. In answer to the question contained in our instructions as to the causes of the defective state of education, it is I think to the indifference of parents, and to their indisposition, in some cases, perhaps, to their inability, on account of low wages, to forego the children's earnings, that much is to be attributed.

Causes of irregularity of attendance at school.

74. The irregularity of attendance at the schools is universally admitted, but it is not entirely to be attributed to the employment of the children themselves in the fields, in very many cases it is more caused by the employment of the mothers, who keep the older children at home to look after the little ones. Poverty, *i.e.*, inability to pay the school fee, is sometimes pleaded as an excuse, but I think not often with much reason, for when the fees are paid for them the children do not attend any the more.

75. The Rev. S. Berkeley of Morebath most kindly took great pains to obtain the best information on the causes of this irregularity of attendance, and sent to all the school managers in his district of diocesan inspection a circular to this effect: "To which of the following causes do you mainly attribute the "irregularity of attendance at elementary schools?

"1. Fair claims of labour for hire.
"2. Fair home claims.
"3. Caprice or indifference of parents.
"4. (Any other cause to be named)."

A very large proportion of the answers assigned No. 3 as the main cause. One correspondent, a diocesan inspector of considerable experience in the adjoining county, modified this opinion by attributing the prevalence of cause 3 to the apathy of teachers and clergy, and a consequent indifference to the efficiency of their school or their people's estimate of the benefit of education.

76. Mr. Berkeley adds—

"No doubt this was painfully true in past years, and may be true in some districts still, but I do not think it is more than exceptionally the case in this district."

It would seem that there is still in many instances a want of consideration or care for the educational wants of the labouring class, in spite of the efforts made and the good example set by many of the leading and most influential owners of property in the county. When the narrow majority in the Devon Chamber of Agriculture declined at Exeter to give any assistance to the inquiry, which under your instructions I was endeavouring to carry out, the old leaven of stagnation, of hatred of inquiry, arising probably from a consciousness of their real position, came out to the full, and was duly commented on by "the Exeter and Plymouth Gazette" in these words—

"Once again the old feeling takes possession of them, and they say 'Let us alone, we are doing what we can for the benefit of the labourers and their children.'"

The time has gone by for such as these to be "let alone," if the legislature wait till *they* propose to advance, it will be a long long time before any step is taken to enable the agricultural labourer to rise above the level of a "clod."

Supply of schools.

77. The supply of schools in my district differs considerably. In Hampshire there is no dearth of schools, though in some parts of the northern division a better arrangement is required, and it was suggested at the meeting held at Mr. Fowler's at Kimpton (No. 48) that one good school for two or three small parishes if conveniently situated would be sufficient for the educational wants of the district, and the Hon. and Rev. S. Best suggests that that school should be fed from dames' schools in each parish for the very small children before they are able to walk to the big school. The population of many of these parishes is so very small that such an arrangement would apparently be a good one.

H.

78. Mr. Benson (No. 104) says aid is wanted from Government to start a good school in a centre of small parishes. Schools being also placed so as to suit outlying districts for the small children.

Central schools.

79. Milton Green school and Gulworthy school, in the neighbourhood of Tavistock, are instances of a central school with a high class master, at the former of which boys attend from distances at a diameter of six miles, and at the latter some children as young as 9 years come five miles. Mr. Christie, the master at Milton Green, says it is not a larger supply of schools that we want, but some mode of getting the children to attend at those already existing.

Grouping of schools.

80. In a letter which the Rev. A. Earle, of West Alvington, wrote to me (No. 207), a portion of which was devotod to the question of education, he suggests a plan of improvement for schools in small agricultural parishes.

"I believe we might improve our present schools at small expense in the following way :—If the schools could be brought into union and grouped, say 25 or 30 together, in connection with a Committee of Education formed out of the Agricultural Chamber and placed under a competent organising master, who should give all his time, under the direction of the committee to whom he should report every month, to organising the said schools, teaching in them, and assisting the present teachers to a better method and discipline, the schools would be sure to improve. The cost would not be great and the salary of the organising master could be paid by contributions from each school in union. The Government inspector could inspect and report, and a smaller grant might be given according to results, and if these results are satisfactory, I do not see the justice of insisting on a certificate. To pay for *results* only and to insist upon a preliminary certificate is, I think, a contradiction, and if a good system of organisation, whereby present educational agencies in remote and small agricultural parishes could be fostered, is possible, I believe it would be the duty of Government to give such aid as the inspectors reports might justify. I believe some plan of this kind in connection with chambers of agriculture would do more to make education general than any compulsory measures connected with an educational rate."

81. The want of schools is much felt in the Holsworthy part of North Devon, and in the neighbourhood of St. Columb in Cornwall, where it was stated that there was scarcely an efficient school in the district.

Great need of alteration of regulations as to grants-in-aid.

I would now call your attention most particularly to the fact that it has been the openly expressed opinion of landowners, clergy, and farmers at almost every public meeting which I have attended in my district, that if the Government would relax the stringent regulations as to grants-in-aid to schools only where there is a certificated teacher it would be most beneficial to the rural parishes. Vide Evid. No. 1, Mr. Chute; No. 2, Resol. 2, Hants Chamber of Agriculture ; No. 48, No. 51, No. 84, Rev. W. Owen; No. 92, Mr. Parris; No. 186, Mr. Wolfe, Mr. Creed, Mr. Wade ; No. 187, No. 206, Mr. Cornish, and Mr. Earle, No. 253.

82. One of the strongest cases is that stated by the Rev. R. Wolfe in his address to the Devon Chamber at Newton Abbot, and at the meeting of the Board of Guardians at Newton. He is the clergyman of one of the Torquay parishes, and as chairman of the Newton Board of Guardians is thoroughly well acquainted with the wants of the small rural parishes adjoining Dartmoor and elsewhere in the union, and he says,—

" Under the present system of granting aid rich localities who are able to pay certificated masters get all, the poorer who are not able, get none. Torquay under the present system is in receipt of State aid to the amount of several hundreds a year, while the poorer parishes in the neighbourhood get nothing. The present system is most objectionable and must be modified, because it is diametrically opposed to common sense and justice, giving all to the rich and nothing to the poorer districts."

83. It is the universal cry throughout the small rural parishes that aid is needed, there is no want of willingness to set up schools, but there is too often a want of funds ; the parish cannot afford to pay a certificated master, and therefore cannot have any aid from the Committee of Council. What can possibly be the objection to putting all schools under inspection and making a grant for results on the report of the inspector, putting aside the question whether the teacher is a certificated one or not?

84. I do not for a moment wish to detract from the good work that has been done throughout the country by the institution of trained teachers, but I think there are also many teachers who from force of circumstances have been, after receiving a certain amount of training, debarred from completing their course and obtaining a certificate, and who are excellent teachers producing probably as good results at their schools as many of the certificated teachers. A great good has been done, a large number of excellently trained teachers are abroad, let those large and rich places which can afford to pay for them employ if they please the certificated teachers; but if education is to spread and to be encouraged throughout the small rural parishes, this rule must be relaxed and aid be given to keep up the schools which are now struggling against hard times and which will otherwise soon share the fate of many I have seen and be *shut up for want of funds.*

85. Turn to the case of Lostwithiel school (No. 294) in a small town in Cornwall where in winter there are on the books 175, and in summer 190 children. The mistress has one teacher to help her, and though complaining of the indifference of parents to their children's education, she states in evidence that 104 children attended 200 times during the past year, of these 31 are in the first class, 19 in the second, and 23 in the third. Not one shilling of Government aid is given to that school because she is not certificated: surely the State ought to countenance so good a school as this in a poor town as well as the schools in rich Torquay.

86. The inquiry with which I have been charged has led me into many small isolated parishes ; and this want has come under my notice not only in the southern and western counties which I have visited this year but also in Cambridgeshire and Yorkshire. In S. 53 of my first report I called your attention to it and I beg again to do so, inasmuch as the cry for a reform on that point has come up louder and with hardly a dissentient voice from those in Hants, Devon, and Cornwall who are really interested in improving the educational state of the agricultural labouring class. There should not in justice be so heavy a burden on the shoulders of the clergymen who in too many instances now have to provide nearly all the means of education in the parish.

Street arabs in small rural towns.

87. Attention was called in the House of Commons to the large numbers of children in Liverpool, Manchester, and Birmingham, growing up perfectly uneducated, except in the ways of vice and crime ;

II.

and I have from time to time been told that the rural districts are far superior in point of morality to the towns. I daresay they may be, and if the surveillance of the ministers of religion or of the employers of labour among a limited population is worth anything they certainly should be better; but at the same time all who are acquainted with the agricultural districts know perfectly well that as a rule there is in every district a small town or large village in which are congregated the worst portion of the population of that district. In those centres are a mass of children growing up not only with insufficient education but without any education at all and subject to the influences of a vicious home; and it seems to me that this is the most difficult class to deal with. Mr. B. Snell said at the Plymouth meeting of the Chamber of Agriculture "he should like to see neglected children committed to some establishment for education up to a certain age," extending in point of fact the provisions and usefulness of the Industrial Schools Act. It is quite useless to imagine that anything short of direct compulsion most rigidly enforced will ever get those children to school, and as Mr. Gifford of Hartley (No. 35) says:—

"Even if you did force them to school it is questionable whether you would do them much good, such is the evil influence of a vicious home."

Their parents care nothing about their education and can only be made to feel by the pressure of penalties for their neglect.

Compulsory education.

88. Doubtless a compulsory system would act most beneficially in the cases of towns large and small, but the expression of opinion in the rural districts has not been favourable to the introduction of it there. There is a great fear of any increase in the rates and in some cases a dislike to the control of the children being taken out of the hands of the parents. I am bound to say that I found considerable willingness on the part of the farmers to aid in improving the present state of education, but I think that the evidence goes to show a preference for retaining the present voluntary system with more state aid and consequently more inspection, or for placing the schools under local management supported by local rates and still under Government inspection.

Preference for voluntary system.

Support of compulsion.

89. On the other hand at Newton Abbot in Devon there was a decided expression of feeling on behalf of a system of compulsory school attendance, not only on the part of Mr. Wolfe the chairman but also by Mr. E. Ford and Mr. Stook, both farmers, the latter giving as his reason that before the present apathy about education among the labourers could be removed it is necessary thoroughly to educate a whole generation. An opinion to the same effect was expressed by Mr. Eld. Brown at a meeting at Plymouth on the 27th March (Evid. No. 286). Mr. Wills also supported it on the ground that it is the duty of the State to provide for the moral health of the children and for the prevention of crime. These were the only public meetings where I found the system advocated. Many have privately expressed their opinion that eventually compulsion must be resorted to, and the schoolmasters are in favour of it on account of the difficulties under the present system of advancing the children in learning, owing to the irregularity of their attendance.

90. Rev. C. S. Bere (No. 112) says:—

"I see nothing short of compulsory education as a real and effective antidote to the present indifference and labour interests of the parents; by labour interest I mean the interest which parents have in keeping their children at home that *they* may work."

91. Rev. G. W. Proctor (No. 256) writes:—

"I suspect nothing would prevail or produce with rapidity the desired effect among the employed but compulsory education of the young, which means education provided by the State out of a rate assessed on all kinds of property. I have grown out of my former fears of an elementary school education under the direction and at the cost of the State."

Half-time or alternate days.

92. The method of securing school attendance by half-days or by alternate days at school and work is not thought to be practicable in agricultural employment owing to the distance to and from work, the vicissitudes of climate, and the need of haste in the work in which children are occasionally employed. Mr. J. H. Veale, of Passaford, gave me an instance of the trial of the alternate day system by one of his neighbours which had utterly failed; the lads agreed to the proposal but did *not* go to school Evid. 279). If, however, a limit of age is fixed by law below which no child shall be employed at all, and that limit is fixed at 10 years, there does not seem to be any need for either of the above methods.

Continuous education above 10 years.

93. It becomes, then, necessary to consider in what way the education of a boy above 10 years shall be continued. I fear it is too true that from the time a boy goes into farm service he but rarely does much towards keeping up the knowledge he has acquired at school. The period of entering such service varies in the different counties. In Hants many go as young as 10 years; in many parts of Devon and Cornwall not till 12 years.

Night schools.

94. Night schools are considered by many to be the best mode of securing this object, and a better organized system, with an alteration of the Committee of Council's regulations as to grants-in-aid of them, was advocated by the farmers and others. I would more particularly call your attention to the opinion of Rev. Sir St. Vincent Hammick, who, in describing his own success with night schools in his parish, alludes to the chief difficulty being the requirement by Government of a certificated teacher, and the not allowing scholars under 12 to be presented for examination; but the evidence goes to show that in parish after parish these schools have been tried, have only answered for a short time, and when the novelty had worn off the lads ceased to attend, and the attempt was given up. In Devon, where the people live in scattered hamlets, the distance to and from the school has been found to be a fatal obstacle.

95. Again, it is said by the farmers that it is very inconvenient to have their carter boys going to night school at the time when they are wanted to do up the horses and fodder the cattle. The schoolmaster at Thorverton told me that lately several farm lads had been forbidden by their employers to attend night school on this ground. Lord Northbrook, on the other hand, showed me two letters from labourers on this point, which showed that the work for the horses being at an end at 3 to 3.30 p.m. the lads could well attend an evening school in summer and in winter.

96. Rev. W. Karslake, of Mesham (No. 171), says,—

Return of agricultural servants, their

"Undoubtedly there is at present great danger of young persons losing, to a great degree, the advantages they have obtained during their early school days, say up to 10 or 12 years, through subsequent neglect. I

am not fond of multiplying legal enactments, but I am inclined to believe that a statute requiring a return, as respects all servants employed in agriculture, of the number of their attendances during the past six months at school or at *some* place of divine worship would be advantageous, and would be hailed as a boon by agriculturists." H. attendance at school or worship for past six months.

97. Mr. Potter, schoolmaster at Stratton, suggests that boys earning wages should attend school from October to March.

98. The question of requiring a certificate of a certain amount of school attendance during the year or of a standard of attainment, to be produced before hiring, I have again frequently submitted for the consideration of the employers of labour. There is no doubt that the more you consider this question the more difficult does it appear to enforce obedience to any law on the subject. I still think it possible in counties where it is the custom to hire carter boys by the year to establish a joint registry of such hiring and of the required certificate, but in other parts of England, where such a custom may not prevail, a vast army of inspectors would be needed. Certificates.

99. Mr. Parsons, a farmer of Abbott's Ann, in Hants, says on this point,—

"A certificate showing too much knowledge on the part of the lad would be rather an objection than an inducement to the farmer to employ him. *Though he has been to school yet he has good moral character*, would be the words of a large class of farmers. If a certificate is required from a lad seeking employment it should comprise: 1. School attendance; 2. Moral character; 3. Proficiency in work."

100. Mr. T. S. Bolitho, at a meeting held at Penzance (No. 309), suggested,—

"That a certificate of school attendance for some hours during the preceding week should be demanded every Monday morning, and if not produced the child should not be employed by anyone; attendance at night school or Sunday school to count."

101. Mr. Spearing declared himself in favour of the production of a certificate either of attendance or examination, and thought that between the ages of 10 and 12 or 13 an attendance of six hours a week at night school during the winter months should be required.

102. I will not multiply extracts from the evidence, the above being sufficient to show that opinions on this point vary, but that there is in some quarters a disposition to give the system a fair trial. If employers would give a preference to lads who could produce a certificate, such as that given by the Southern Counties Association, or even the humbler one of the village schoolmaster, it would have a good influence in encouraging education among the children, and would overcome some of the reluctance now shown by the parents to send their children to school. Surely it must now be clear, even to the most reluctant, that in these days, when the use of machinery is daily becoming more common, the demand for labourers on a farm is for work requiring skill and care more than mere physical strength, that mind is wanted as well as brute force, and that it is to the advantage of the employer to have as his labourers men educated, at any rate, up to the pitch of reading, writing, and the four first rules of arithmetic; and the labourer is, I believe, beginning to see that in education lies the prospect of success in life for his children, and that in his capability of education he is secure of a good position if he will only put it to the test.

103. The question is, shall the State step in and insist on the duty of a man to care for his children's moral welfare being fulfilled. It may be that without some such step no progress will be made. There will still be poverty pleaded, low wages, and the necessity for the children to earn something; and there comes a question worthy of some consideration. Suppose the law says no child shall work till 10, and that from that age to 13 he shall attend school so many days in the year, will such an amount of labour be withdrawn from the market as to necessitate a higher rate of wages for the able-bodied men and older lads? And, again, taking it to be a fact that the best educated lads are *now* seeking other than agricultural employment, will not an extension of the blessings of education to a greater number by some legal action raise the position of the whole agricultural labouring class, and eventually do away, to a large extent, with the employment of women in the fields? Duty of State to interfere for moral welfare of children.

104. Farmers would doubtless say they cannot afford to pay higher wages, but, with all due submission, it is not a tenant-farmer's question. The burden must eventually fall on the landowner, in the shape of the rent which he will be able to obtain for a farm which, under such circumstances, may or may not require a larger outlay of capital by the tenant for the same return he now gets.

105. An opinion was expressed on various occasions that the children of small farmers are in a worse position in the matter of education than those of the labourers, and more particularly in those parts of Devon where the holdings are small, and the farmers, not being men of capital, are obliged to keep their children at home to do the work of the farm as soon as they are able to endure the fatigue or are strong enough to undertake the labour. I would refer you to the evidence of Mr. Parsons, a guardian of Holsworthy (No. 261), who says, State of education among small farmers.

"The children in the union are better educated than many farmers' sons. The will for education is not wanting among the farmers, but they have no capital, and are obliged to keep their lads at home to work on the farm."

106. Also to that of Mr. Sanders, a farmer at Pyworthy (No. 265), who says,—

"The farmers complain that the children of the labourers get a better education than their own; they are often obliged by poverty to keep their children at home to work on the farms. I think that the labourers' children should be taught reading, writing, and arithmetic, but should not have such an education as would put them above the farmers."

107. To that of Mr. Mills, schoolmaster at North Lew (No. 280):—

"The farmers send their children to this school; many of them are very rough and ignorant, and not being able to employ labour they keep their children at home to work on the farms."

108. The same want was expressed by Mr. Mark White, a farmer at Heckfield in Hants (No. 23), in these words:—

"The children of small farmers are worse off for education than those of the labourers. There is no school of a grade between the village school and the boarding school that would meet the wants of the farmer at a cheap rate, and I think such a school is very much needed."

H. 109. Mr. Nath. Heard (No. 267), an occupier of 500 acres, who began life as a labouring man, laments his want of education in hese words:—

"I cannot write well. I would give 50*l.* to be able to write a good letter."

110. In Devonshire, at any rate, there are two examples of excellent middle class schools, capable of supplying the want above-mentioned; one at West Buckland, which was under the management of Prebendary Brereton, and supported by all the influence and power of Earl Fortescue, and whose fame is so wide spread as to require no words of mine to call public attention to it; the other at Sampford Peverell, which has been under the care and management of the Rev. C. S. Bere, of Uploman. I am happy to say that after a period of difficulty through which Mr. Bere has most nobly struggled, this school is now making rapid progress. The farmers of the neighbourhood who have children there spoke in the highest terms of it, and there is every reason to believe that Mr. Bere will have his reward in the satisfaction of feeling that he has supplied a want which is much felt, and in seeing the rising generation of farmers better educated than their forefathers, and consequently more willing to aid in the advancement of those who are dependent upon them for their daily subsistence.

Industrial schools. 111. The number of industrial schools at present existing is not great, but I have great pleasure in calling your attention to an excellent one at Old Alresford, built and supported by Miss Onslow (Evid., 72), where there are 34 girls of ages varying from 11 to 20. They are instructed in house-work, in the work of the kitchen and laundry, and also attend school. The officers are a matron, a governess, and a laundress.

112. There is an industrial school at Winchester and at Exeter. There is in the South Stoneham union-house a separate place for girls of 14 years and upwards, where eight at a time are taught cooking and household work; while at school they learn washing.

4. Cottages.

Hants. Stratton. 113. In the district represented at the meeting at Stratton, it was said that the cottages are sufficient in number for the population, but that there are not enough attached to the farms under the farmer's control; they are well supplied with gardens and allotments.

Odiham. Odiham district.—The cottages are sufficient in number, not crowded, with two or sometimes three bedrooms, with good gardens in the rural parts, and allotments where there are no gardens. Rent varies from 1*s.* 6*d.* to 2*s.* 6*d.* a week. (Nos. 19 and 20).

Heckfield. In the neighbourhood of Heckfield cottage rent varies from 1*s.* 2*d.* to 2*s.* a week, according to the size of the garden; mostly with two bedrooms; some of Lord Eversley's have three bedrooms and good out-door accommodation.

Hartley. In Hartley Row, a town, there are 300 cottages, nearly all of which have two bedrooms, back-house, &c., with gardens varying in size. Rev. Mr. Gifford says, some of them return 25 per cent. for the first 12 years of their existence.

N. Waltham. North Waltham.—Cottage accommodation is, on the average, very bad. Gardens are small, but allotments can be obtained when required.

Micheldever. Micheldever.—Cottages are generally good, they belong to the landowners. Cottage accommodation is being increased. Rent ranges from 2*l.* to 2*l.* 10*s.* a year.

Kimpton. Kimpton.—Many of the cottages are old but large; some have three, others only two bedrooms. Rent, 1*s.* a week. Much is done to improve them, but very much more is required.

Abbott's Ann. Abbott's Ann and neighbourhood is favourably circumstanced in respect of cottage accommodation. Several new ones have been recently built by Rev. T. Best of Redrice, on the farms. In all cases double cottages; in some, two or three double ones near each other. The old cottages are not so bad inside as their outward appearance would lead one to believe; some with two, others with three bedrooms, with a garden. Rent varies from 1*s.*, 1*s.* 3*d.*, to 1*s.* 6*d.* a week.

Allotments. Abbott's Ann. There are two allotment fields in Abbott's Ann; one, the property of Mr. Fowler, is let at 6*d.* a lug, the other, belonging to Hon. and Rev. S. Best, is let at 2½*d.* a lug.

Amport. At Amport the cottages are not overcrowded, lodgers not being permitted. There are 90: 25 of which are modern, the remainder are old but in good repair. They all have a kitchen, pantry, and out-house; 30 have three bedrooms; 57 have two bedrooms; and 7 have but one. The gardens of the Marquis of Winchester's cottages average 24 perches each, and those belonging to other owners 16 perches, but this includes the site of the cottage. Rents are as follows:—

9	from 70*s.* to 80*s.*	a year.	
35	„ 60*s.* to 65*s.*	„	
40	at 52*s.*	„	
10	from 20*s.* to 40*s.*	„	

Much has been done here since 1845.

Old Alresford. At Old Alresford the cottages, with the exception of four, built by one of the landed proprietors, are not good. The larger number belong to a non-resident proprietor. Almost all have fair gardens. Rent is 1*s.*, 1*s.* 3*d.*, and, in a few instances, 2*s.* a week.

Chilcomb. The cottages at Chilcomb, held under the Dean and Chapter of Winchester, were much in want of repair.

In the Petersfield district cottages are generally very good, not quite sufficient in number, but not much overcrowded. They all have good gardens or allotments close at hand.

Botley. Botley.—Bedroom accommodation is insufficient. The inclosure of commons has led to the building of many more cottages than formerly existed on the same acreage.

New Forest. In the New Forest cottage rent is said to average 4*l.* a year; they are on the whole good and sufficient in number, with good gardens. Those at Beaulieu, belonging to Lord Henry Scott, have a living room, scullery and pantry, and three bedrooms; 20 perches of garden, pig-stye, privy, &c., at a rent of 1*s.* a week. I do not think a neighbouring place called Beaulieu Rails presents quite so bright a picture. There are also a number of squatters in this district whose dwellings are very miserable.

Fordingbridge. In the Fordingbridge district and on the western borders of the forest, there is not so good a class of cottage as in many other parts of the county, and rents range from 1*s.* a week to 5*l.* a year, with inadequate bedroom accommodation. Here, also, there are usually good-sized gardens attached, or allotments to be obtained.

114. Budleigh.—The cottages are bad, but improvements are being made. Those on the farms are reckoned at 1*s.* a week rent. H. Devon. Budleigh.

Broadclyst.—The cost of a double cottage with two rooms down and two up, built of brick and slate, is about 200*l.* Supply of cottages sufficient. Broadclyst.

In the Honiton District the amount of cottage accommodation and the quality is unsatisfactory. The cottages by no means generally have gardens. Honiton.

In Halberton sleeping and cottage accommodation is generally bad. Few have more than two bedrooms, many have only one, and they are overcrowded. Rents vary from 1*s.* 2*d.* to 1*s.* 6*d.* a week. Halberton.

At Uploman and Huntsham they are better; in the latter village they are usually built in pairs, one cottage containing three, the other two bedrooms. A pair costs 200*l.* Rent, with a quarter acre of garden, 1*s.* a week for each cottage. Uploman and Huntsham.

On the property of Mr. J. Heathcote Amory, M.P., in Bolham and other parishes adjoining Tiverton, great improvements are being made in the dwellings of the agricultural poor. J. H. Amory, M.P.

At Cadeleigh cottages are bad, and the rents from 3*l.* 10*s.* to 4*l.* a year and rates. Cadeleigh.

At Cadbury are some good cottages, with three bedrooms and a garden, let at 1*s.* a week. Cadbury.

At Bampton, where there is an abundant supply of stone on the spot, a double cottage, with kitchen, backhouse, and two bedrooms in each, can be built for 120*l.*, and each will produce a rent of 4*l.* a year with a garden. Bampton.

At Morebath Mr. Montague Bere has some good cottages, with three bedrooms and half an acre of garden, let at 5*l.* 5*s.* a year. The cottages generally in that parish are in a satisfactory state. Morebath.

The cottages on Lord Portsmouth's estate have been much improved of late. They are not overcrowded and have very good gardens or allotments of land. Earl of Portsmouth.

In the district near Barnstaple and Combe Martin cottages are reported to be generally in fair condition, though in some cases there is overcrowding. Rents, with a garden, vary from 2*l.* 10*s.* to 4*l.* and upwards. Barnstaple, &c.

In the district of Chagford, the Tawtons, and Okehampton the accommodation is not good, and the rents are high; in one case at Drewsteignton the rent for a cottage with one room down and one bedroom is 3*l.* a year, and 3*s.* for rates; these people have an allotment of 20 yards, for which they pay 6*s.* 8*d.* a year, and they also had to pay last year 1*s.* a yard for their potatoe ground in a farmer's field. Drewsteignton.

In the Newton Abbot district the cottages are fair, though many are very old; there are gardens attached to most of them. Rent about 1*s.* a week for those of agricultural labourers. Newton Abbot.

In the district of Kingsbridge cottage accommodation is very indifferent. It was stated at the meeting that there were many cottages with only one bedroom, not enough with two, and very few with three bedrooms. The average rent is 2*l.* to 3*l.* a year. There are usually gardens attached to them. At Stokenham and Tor Cross I found the dwellings very bad, and the people complained of the difficulty of getting the landlord to do any repairs. Kingsbridge.

In Plympton St. Mary union the cottages are altogether inferior and the accommodation inadequate. Rent varies from 2*l.* to 6*l.* a year. In some of the villages which I visited in that union there was hardly a privy to be found belonging to any cottage. Plympton St. Mary.

The Duke of Bedford's cottages at Tavistock and in the neighbourhood are very good. Mr. G. Martin kindly supplied me with the number of cottages in Tavistock parish and the rent, viz., 386 cottages, rented at 3*l.* 10*s.* a year. There are also upwards of 400 allotments averaging 20 perches, each let at about 2*l.* 15*s.* an acre. Tavistock.

He says that the cost of erecting labourers' cottages on this property is about 280*l.* or 300*l.* per pair, this sum includes ground work and all other costs. If more than two are built together the cost would be somewhat reduced. Many of the duke's cottages in the county have cost much less than the sum I have named, but with the increased price of labour and materials together with the enlarged accommodation now given they cannot now be built for less than I have stated.

The district around Holsworthy, including Clawton, Ashwater, &c., &c. is very badly off for cottages. They have for the most part one living room and one bedroom, with an earth floor in the living room. There is generally a garden. Rent is about 1*s.* a week. Holsworthy.

Cottages in this district are not good, with the exception of those on Lord Clinton's property. The village of Merton contains some excellent dwellings of all ages, with gardens and an abundant supply of allotments. Rents varying from 3*l.* 10*s.* to 5*l.* a year. Hatherleigh. Merton.

115. In Cornwall a very large number of the cottages are held on leases for lives; the landowners in such cases cannot be held answerable for their state, it is well known that as a rule when cottage property of this kind comes into the hands of the landowner it is usually in a most delapidated state, and requires a considerable outlay of money before the dwellings can be made fit for a new tenant, and such improvements must of necessity be made by degrees. Cornwall.

The relieving officers of the Liskeard union report that in the Liskeard district the cottages are in some parts crowded. In the Looe district that many houses have but one sleeping apartment, even in cases of large families, more especially mentioning the parish of St. Martin. In the Callington district that the cottages are not crowded. Rents with a garden vary from 50*s.* to 5*l.* 5*s.* a year. Liskeard Union.

Cottage accommodation is very insufficient and bad; there is not sufficient bedroom accommodation. Rents vary from 4*l.* to 6*l.* *Very little would be got for* 4*l.* Gulval.

At Trelowarren the average rent of a cottage and garden is 3*l.* a year. At Grade the cottages are very much crowded, owing to the increase of population attracted by the Lizard Serpentine Works, and to the difficulty of getting any land for building. At St. Keverne the cottages are not sufficient in number, and there is a great deficiency of gardens, and no allotments, also a great want of privies. Average rent is 3*l.* a year. Helston District.

The cottage accommodation in this district is very indifferent. Many are without gardens; the allotment system does not prevail, but the labourers generally take land for their potatoe crops every year. St. Columb.

At St. Minver the state of the cottages is not all that could be desired; they mostly have two bedrooms, but few have privies. Nearly every one has a garden. Rent 40*s.* to 3*l.* 10*s.* a year with a garden. St. Minver.

H. Michaelstow, &c.

At Michaelstow and its neighbourhood slate and granite are close at hand, and the cottages are consequently substantial and good; they usually have two bedrooms, but are often overcrowded. Rent with a garden 1*s.* a week to 3*l.* a year.

Kilkhampton.

At Kilkhampton the Rev. Lord John Thynne has some excellent cottages, some with two bedrooms, and some with three, outhouses and privies. Rent with a garden 3*l.* a year, and sometimes "outs" also 6*s.* a year.

Suggestions as to improvement of cottages, &c.

116. In accordance with your instructions I have endeavoured to obtain opinions as to the best mode of improving the condition of the cottages, and generally as to the working of the Lands Improvement Act (28 & 29 Vict. c. 79.), and I subjoin extracts from the evidence of some practical men, many of whom are agents for or managers of properties, and who are well capable of giving a sound opinion on the matter.

117. Mr. J. P. Fowler, of Kimpton (No. 51), who in addition to a holding of 1,000 acres, is manager of the Tedworth estate, says,—

"I think many landlords might avail themselves of the power given to the Enclosure Commissioners by the 27 & 28 Vict. c. 114. to advance money for the improvement of land, &c. very much to the benefit of the labourer. If gentlemen would build good cottages on their estate and let them to their tenants they would find it add so much to the value of their property that farmers would pay a good per-centage on the outlay. It would give the farmer more interest in the labourer, for instead of finding, as they often do now, bad cottages occupied by men who have no interest in the farmer's welfare or the farmer in theirs, a much better feeling would exist. Good cottage accommodation will always be self-supporting, it is a great advantage to the farmer, and tends more to improve our class of labourers than any government legislation."

118. Mr. W. Warner (No. 76) says,—

"If landlords would be content to receive the same interest for their money on cottages as on the land, it would be an advantage to both landlord and tenant, as cottages might be built to pay 3½ to 4 per cent. interest."

119. Mr. J. W. Kemp, agent to Mr. Troyte,—

"Thinks it impossible to provide good cottage accommodation on self-supporting terms and involving no disadvantage to the tenant."

120. Rev. C. Bere,—

"Thinks it impossible for good cottage accommodation to be provided on self-supporting terms, unless groups of eight or six, or at least four, could be built together.

121. Rev. Canon Girdlestone says:—

"Just as the landowner always provides a good house and out-buildings for the tenant farmer, which form part of the let for which the rent is paid, so he ought to see that on or near the farm which he lets to his tenant farmer, there is a sufficient number of good cottages for the labourers employed on the farm, which he, and not the tenant farmer, ought to keep in repair. These should form part of the let for which he receives his rent, the value of which ought to be included in the let, for which he ought not to expect any separate profit, and the control of which, he should, to a certain extent, keep in his own hands."

122. Rev. W. Karslake (No. 171), says:—

"It is believed that no system can be devised by which cottages can be made really self-supporting as the habitations of agricultural labourers, but that landowners must be content to provide cottages for the labourers on the same principle as they provide for the stock on a farm, and a residence for the farmer, as necessary, that is, to the profitable occupation of the land."

123. Mr. J. H. Holley, of Oaklands, a gentlemen of vast experience in agricultural matters not only in Devon, but formerly in Norfolk, writes thus:—

"As regards the erection of cottages and the moral improvement of the labouring classes, I do not see my way clearly to legislative interference. The erection of cottages depends on the requirements of three parties, the owner of the land, the tenant, and the labourer. As soon as the tenant discovers that it is necessary for the profitable cultivation of his farm that the labourer should be resident on it, he will induce the owner to build the residences, as well as the barn, stabling, and other buildings, previous to this period considered requisite. There is a sort of partnership existing between landlord and tenant; the one finds the capital for the working of the land, the other the capital and knowledge for the tillage. There must be a prospect of remuneration to these two parties in realising the anticipated improvement in the position of the labourer."

124. Mr. R. Fulford, solicitor, says:—

"It is the interest both of landlord and tenant to provide sufficient accommodation to the farm tenant for his labourers. I think a tenant would gladly pay 5*l.* per cent. on the outlay for cottage accommodation for his labourers, and would underlet, to insure permanent labourers, at a reduced rental to his men."

125. Mr. J. F. Delmar, of Stratton, agent for several landowners in the neighbourhood, says:—

"The present mode of borrowing money under the Lands Improvement Act is very cumbrous and expensive, the expenses being much, and unnecessarily increased by surveyors' visits, &c. during the progress of the work. I would not advise having recourse to those means unless it was unavoidable."

126. Mr. W. J. Woollcombe (No. 287), a solicitor at Plymouth, and well acquainted with the management of estates, thinks that the principle of the Labouring Classes Dwelling House Act, 29 Vict. c. 28., might be advantageously applied in rural districts:—

"What is wanted, is, I think, to afford to landowners the greatest possible facilities for the erection and improvement of labourers' dwellings without large expense, and without any further interference than is actually needful to secure the due expenditure of the money lent for this purpose. In order to secure this, it seems to me essential that the loan should be on such easy terms as would enable the landowner to let his cottages, when built, at low rents, and further, that the Act should extend to trustees and persons having limited interests, *e.g.*, tenants for life."

Inspection of cottages.

127. It was suggested by Mr. Soltau, of Little Efford, near Plymouth, that cottages should be placed under inspection, and that, for the purpose of putting an end to the present overcrowded state of many of the labourers' dwellings, the inspector should give a certificate of the number of persons that each cottage was capable of containing with due regard to decency and health.

General state of cottages in district.

128. It appears from the above extracts from the evidence, that in Hampshire there is not much cause for complaint as to the state of the cottages, and that much has of late been done towards their improve-

ment. The probable reason for this satisfactory state is, that there are many large resident landowners in the county who devote their attention to the welfare of the labouring class living on their properties, and that in many parts of the county there is a class of farmers holding a great number of acres, and willing to aid in the march of improvement.

129. On the other hand, the accounts of cottages in Cornwall and Devon are not, with some exceptions, at all satisfactory. In the first-named county it would seem that the tenure by leases on lives does not conduce to a good state of dwellings, neither the lessee nor the landlord being interested in repairing them.

130. In Devon, with the exception of the estates of a few landowners, the cottages are in a deplorable state, more especially in the Honiton Union, and in the district near to Holsworthy. The farms are for the most part very small, the occupiers men of no capital, and last, but not least, the possessors of the land are too often absentees, so that the profit of the land is spent elsewhere, and bestows no benefit on the district from which it is drawn.

131. It may be that the untidiness within the cottages is partly to be attributed to the natural indolence and slothfulness of the labourer himself; the evidence of some farmers who have come from other counties (Evid. Nos. 205 and 265) tends to show that the Devon men are bad workers, and the want of energy in the field which causes that impression probably affects equally the regard for comfort in the home.

Difficulties in dealing with cottage question.

132. In dealing with this cottage question it is necessary to consider the case of the owners of such property, who regard it as an investment and look for actual money interest from it, as well as that of the landowners, by whom cottage property is considered more as an adjunct of the land than as a property that is expected to pay directly.

133. I would specially invite your attention to the paper which Lord Northbrook kindly sent to me (No. 46), and in which he sets forth how the present system of wages, combined with the tenure of cottages, operates injuriously to the labourer who is not fortunate enough to live in a cottage on the farm of his employer at a rent far lower than that charged by those persons who cannot let their cottages at an unremunerative rent. He concludes his remarks in these words:—

"My strong impression is that the condition of the agricultural labourer, as regards cottage accommodation, will not be put on a sound footing so long as this artificial system continues; at the same time it would be a work of extreme difficulty to change it, for it would require the co-operation of landowners and farmers over a large extent of country

Alteration in provisions of Land Improvement Act needed.

134. The evidence which I obtained in Yorkshire and Cambridgeshire, as well as in the counties on which I am now reporting, as to the working of the Lands Improvement Act, and the companies which are in existence for the purpose of advancing money under its provisions, most clearly shows that an alteration may be most beneficially made in the terms on which money can now be borrowed for the improvement of estates. The present system is far too expensive; and on this point, Mr. Delmar, who manages estates in that poverty-stricken district of Stratton and Holsworthy, may be taken as a good opinion.

135. You have various classes of estates to deal with. The most favourable is the one free of encumbrance and unentailed, but still not yielding an income sufficiently large to enable the possessor to spend more than a small sum annually on improvements. There are small estates in good order, but incapable of bearing such extra charges as would be required under the existing law; there are large and scattered estates that have been entailed for generations, and are considerably encumbered; and you have ofttimes the estates of negligent absentee landlords.

Enlarged powers to holders of life estates.

136. It has been suggested to me that not only should the present regulations as to the borrowing of money be altered so as to make the process less expensive, but that in some form more enlarged powers should be given to owners of life estates to charge their property within certain specified limits for improvements and for cottages.

Desirable form of legislation.

137. I would venture to suggest for your consideration whether it is not expedient that legislation should take place in such a direction as to bring into the market these large tracts of encumbered land, enabling those who have capital to acquire such land if they desire so to do, and conferring a boon on those who now possess them by giving them money to spend on such an amount of territory as they wish to concentrate round their homes, while at the same time the curse of poverty and misery will be removed from those districts whence all the profit is drawn, and to which none returns. Bad cottages, would, I think, then become more rare; a portion, at any rate, of the profits would be spent upon the spot; a more contented race of farmers and of labourers would be found; and the education of the people, now flagging for want of funds, would progress.

138. Some may say that this question of the dwellings of the poor in agricultural districts is a passing question of the hour, and that it is not really so great an evil as is represented. I would answer, Go into the country and see for yourself. Use your common sense, and call to mind the effect of absenteeism on Ireland; and then say whether or not in those portions of England where poverty and misery arising from the same cause meet you at every step, there is not urgent reason for dealing with the evils now existing, by some legislative enactment, which shall put an end to a state of apathy and indifference in many holders of encumbered estates, and open the doors for the spending of capital on the land by those who *are* able, in the place of those who are now unable to do so.

Miscellaneous.

Benefit societies.

139. I trust that the following extracts from the rules of the two most important and flourishing benefit societies in my district may be of service to you in considering that subject.

Advantages of a deposit system.

The point in connexion with benefit societies, on which those with whom I have discussed the question lay much stress, is that it would be most beneficial that a deposit system should be introduced into them, whereby the widow or children would reap some advantage from the subscription which the man has been paying annually through a great part of his life, that is to say, a combination of savings' bank and club. The poor people are quite awake to this, many a labouring man has said to me, "If I "had to begin again, I'd put into the savings' bank instead of the club."

H. 140. It is, doubtless, an immense advantage to the poor man to get his medical attendance cheap, and a weekly allowance while he is ill and incapacitated from work; but suppose a case of a man who never has a day's sickness, but who has a large family, he makes his monthly payment to the club for many years, and at his death there is a sum given for his funeral, but all the hard-earned savings of his life having been paid into the club are lost to his family.

141. There is also required, I think, some better security for the money deposited in the clubs. Dr. Willis, of Horrabridge, says:—

"In my opinion a valuable aid to the improvement of the labourer and the diminution of taxation for the maintenance of the poor, would be the establishment of a benefit society under the control of the Government, and attached to *every* post office as the savings bank is, at which every labourer with wages not amounting to more than 20*s.* a week could pay, to receive in sickness a sum being 2*s.* or 3*s.* less weekly than he earned in health, and not being a member of any other benefit society; the sum so paid for such benefit to include an annuity after the age of 60."

Hampshire Friendly Society.

142. The following is the notice of the deposit principle adopted by the Hampshire Friendly Society:—

This branch of the society is established on the same principle that has been adopted in the county friendly societies of Wiltshire and of Surrey.

It is a benefit society, because it provides—

1. Medical attendance.
2. An allowance in sickness.
   [A member on joining, fixes his own daily sick pay, and this sum he must pay monthly to the common sick fund.]
3. Old age allowance at 70.

It is a deposit society, because—

1. The members receive back annually to their own private account or deposit, also called their Rest, whatever sums remain over from the common sick fund, after providing for the above objects, of sick, old age, and medical allowance; and they thus have all the advantages of a sharing club, without its risks.
2. They may pay in to their own deposit or rest, any further sum they please, as into a savings bank.
3. They may withdraw any sum they please from their deposit, as from a savings' bank.
4. Deposits receive interest, as in the Post Office Savings' Bank.
5. The balance of the deposit remaining at a member's death is paid to whomsoever he appoints.

The society admits women as well as men, and persons of doubtful as well as of sound health.

All members, but especially those in doubtful health, should pay in as much as possible to their own deposit, as into a savings' bank.

Parents will find it of advantage to pay in for their children until they are old enough to become members, that is, begin to earn wages, when they will have a deposit or rest to begin with.—Rule 75.

Members are divided into four classes:—A, B, C, and D, according to their age and health on admission. The larger a member's deposit or rest, the longer he can draw upon the common fund in case of sickness, because every member must draw a certain proportion of his sick pay from his own deposit; thus a sick member in class A, having a deposit or rest of 10*l.* of his own, can draw 30*l.* more in sick pay from the society; if his own deposit were 20*l.*, he could draw 60*l.* more from the society, and so on in proportion. Unless members in classes C and D (that is, members in doubtful health), are able to keep up a good deposit by means of their own savings, over and above what they pay monthly to the common fund, it will not answer their purpose to join the society.

143. The report of this society for 1867, says:—

"The object of this deposit system is to enable persons of any age, and in any state of health to secure the advantages of a benefit society in sickness, old age, and death, combined with those of a savings' bank, and an annual division of their funds, which are carried to the account of the several members, in proportion to their respective interests in the same at the end of every year, and bear interest at the same rate as the Post Office Savings' Bank."

Western Provident Association.

144. The Western Provident Association is the other important benefit society existing in my district. The objects of this society are to enable the industrial classes:—

1. To provide a certain fixed weekly allowance during sickness, also medical attendance and medicines.
2. To secure deferred annuities (old age pay), to commence at certain given ages, not exceeding 30*l.* a year.
3. To secure a certain sum at death, not exceeding 200*l.*
4. To secure sums not exceeding 200*l.* (deferred sums), payable at given ages, or immediately to the family or representative, in the event of death.
5. To secure endowments for children on attaining the ages of 14, 18, or 21 years.
6. To secure life assurance on the deposit system to the extent of 200*l.*
7. To secure annuities on the same system to the extent of 30*l.* a year.

145. The report for 1868 says:—

"That the number of members is steadily increasing, although the want of more general information as to the principles on which friendly societies can be safely founded, retards, and will, doubtless continue to retard the growth of any society having the certainty of payment of the promised benefits as its chief recommendation."

Milton Abbot penny bank.

The number of members admitted in 1867 was 238, in 1868, 268; but the receipts in 1868 were a trifle below those of the previous year.

146. At Milton Abbot, Sir St. V. Hammick has a penny bank under his own management. No person is allowed to have more than 5*l.* in all deposited (the deposits being 1*d.* or more at a time). The money is then transferred to the Post Office Savings' Bank, but the depositor may continue to pay to the penny

bank if he chooses. Interest is paid on every 10*s.* deposited before July 1 or January 1 in each year, and remaining in the bank for six months at the rate of 2½ per cent. H.

March 23rd, 1869.

147. Mr. Richd. Foster's Lostwithiel Penny Bank. Lostwithiel Penny Bank.

	£	*s.*	*d.*
On the first Monday in March 1869, 180 balances were brought forward, amounting to	342	12	9
On 84 accounts, interest was allowed at 2½ per cent.	6	14	0
	£349	6	9

Throughout the year 1868–69, 238 accounts had been open, and 115*l.* 6*s.* 2*d.* withdrawn by the customers.

29 accounts	between 1*d.* and 2*s.* 6*d.*
21 ,,	2*s.* 6*d.* and 5*s.*
38 ,,	5*s.* and 10*s.*
20 ,,	10*s.* and 1*l.*
72 accounts	above 1*l.*
180	

148. Mr. Potter, the old schoolmaster at Stratton (No. 44), says that friendly societies and clubs if on a proper footing do much good in a village. Opinions as to societies.

149. At the meeting at Broadclyst it was said that the labourers do not save much money; they have their clubs and get allowances in sickness and for funeral expenses. The payment to the club is 1*s.* a month, and when this payment is made the public-house keeper deducts 1½*d.*; this club has been in existence for 100 years and has 180 members.

150. Mr. Coplestone says that men prefer clubs to savings banks.

151. Ware, a labouring man at Uploman, gives this evidence,—

"Some clubs part the money every seven years, keeping back some in the box to pay for sickness. I think a deposit system with a repayment to the family of a portion of the money at the death of the depositor would be acceptable to the poor. Men pay 12*s.* a year to the club. There is not much to spare out of a poor man's earnings for a savings bank.

152. Mr. Goodding, farmer, Morebath,— Savings by labourers.

"Does not think much money is saved by the labourers except perhaps by a few young men; the single men do not stay long in one place."

153. W. Melhuish, Esq., of Clawton, (No. 266), is a receiver for the Devon and Exeter Savings Bank. The deposits of agricultural labourers and of a few small farmers from the parishes of Clawton, Ashwater, and others near Holsworthy average over 300*l.* a year. Farm servants deposit perhaps more than the labourers.

154. Rev. J. C. Kempe, of Merton, stated that as receiver for the Devon and Exeter Savings Bank he received in his parish from 200*l.* to 300*l.* a year, chiefly from young men in farm service and from labourers.

155. Mr. Balkwill, at Kingsbridge, a receiver for the savings bank stated that there was a fair proportion of agricultural labourers among the depositors, that the wives now come with money in purses, whereas formerly they used to bring 1*s.* 6*d.* at a time in the corner of their pocket handkerchiefs. He considered the agricultural labourers were now far better off than they were 30 years ago.

156. Mr. Corin, of Tolver, near Penzance, a large market gardener, says,—

"Labourers cannot save anything; the benefit clubs are mostly going down."

157. It would seem that the agricultural labourer has not much chance of saving, except during those years when as a farm lad he lives and is boarded in his master's house or in that of the foreman, and when, with the exception of the outlay for clothes, his wages should accumulate. He may during those years, if prudent, lay the foundation of a small store; and having become accustomed to thrifty habits he may be induced in after life to put by some portion of his earnings for the benefit of his family or to improve his position in the world.

158. It is the custom in Hants to give, in addition to the weekly wage of 4*s.* or 5*s.*, a sum of money, say 2*l.* 10*s.*, at the end of the year of hiring. Mr. Dear (No. 74) says that a lad of 16 to 18 years of age will get 7*s.* a week and 6*l.* or 7*l.* at Michaelmas, younger ones 5*s.* a week and 3*l.* at Michaelmas, but in that case they pay for their board though lodged free of expense.

Mr. Warner's (No. 76) boys of ages varying from 12 to 16 get from 4*s.* 6*d.* to 5*s.* 6*d.* a week; one boy of 17 years working on Sundays gets 7*s.* a week.

159. Lads in Devon who live in the farm houses do not at first receive much if any money, but frequently have their clothes given them besides board and lodging. At 12 years of age they get 1*s.* a week, food and lodging, and their wages are raised at the rate of 3*d.* or 6*d.* a week per year till they become men; at 20 years and upwards the pay is 4*s.* a week board and lodging.

160. In Cornwall, Mr. Grigg, near Morval, says boys of 8 or 9 years of age go to farm service for their meat and sometimes lodging. When the boy arrives at 12 or 14 years of age he gets meat and 40*s.* a year. At St. Minver, North Cornwall, lads of 12 and 13 years of age begin with 2*l.* 10*s.* a year board and lodging, and the pay is raised perhaps a 1*l.* a year as they get older.

161. It does not appear at first sight that much can be saved out of these earnings, but I was assured by Mr. Appleton, a surgeon at St. Keverne in Cornwall, that he knew many instances of men beginning as agricultural labourers who had risen by their industry and frugality to become small farmers, and he has kindly placed the names of these men at my disposal. The evidence also of Mr. Melhuish, Mr. Kempe, and Mr. Balkwill, goes to show that there is an increasing desire among the labourers to avail themselves of the savings banks.

162. In the two western counties there are, perhaps, more small holdings within the reach of saving men than in many other parts of England, and there is a class called dairymen in Devon and in Dairymen.

H.

the part of Cornwall west of Penzance, who rise from the position of a labourer to that of a farmer by the following means:—

A labouring man takes a dairy from the farmer at so much per cow, depositing a quarter's payment in advance. If the dairy is 20 cows he does no other work, if under that number he usually works on the farm three or four days in the week; he keeps a horse on the same land; if he has 15 cows and upwards, he also keeps pigs. The take is by the year: each cow being in the dairy 40 weeks the dairyman gets the calf. The usual rent per cow is about 10*l.* Mr. Goodding says, this is the only way in which a labourer here can rise. A man who lived with me as a labourer raised himself in this way, is now renting a farm at 100*l.* a year, and has put by some money.

163. At St. Minver, in Cornwall, Mr. Liddell gives two instances of this kind; one now farming from 50 to 60 acres, the other 100 acres; both began as farm labourers. The first had lived with Mr. Liddell for seven years, the other for three years, and had then gone to the mines.

164. Though these instances do not quite come up to the cases vouched for by the Rev. Scott Surtees of Sprotburgh, in Yorkshire, to which I referred in my Report of last year (s. 137), still I think they are sufficient to show that there is some possibility of saving a little, even out of the low rate of wages current in Devon, and perhaps that if the inducements of an improved system in the benefit societies, such as the deposit system alluded to above, were more commonly held out to the labourers, they might gradually become less improvident.

165. Dr. Budd (No. 94) thinks that under the present system and at the present rate of wages, the labourer must come eventually on the parish for maintenance and relief. It is precisely because of the existence of the feeling in his mind, that in his old age the parish will provide for him, that there is so much difficulty in making him understand the advantages of prudence and of laying by something "for a rainy day." Whether by any alteration in the present system of relief under the Poor Law a beneficial change in this direction might be effected is, perhaps, a question worthy of consideration by the authorities of the Poor Law Board.

Piece-work.

166. Piece-work and harvest-pay ought to contribute somewhat to the bettering of the labourer's condition, and it is, I imagine, usually the case that an ordinary labourer, by which I mean others than foremen, carters, and shepherds who are better paid, has opportunities of getting piece-work, and thereby adding to his usual earnings. But in this, so much depends not only on the physical capability but also on the *energy* of the man himself. In Devon, if the account of the powers of a labourer given by Mr. Benson (No. 104), for many years steward to the late Duke of Bedford, be a true one, and I feel sure it is so, the piece-work is not very vigorously done; he says,—

"Whereas in Lancashire a man would get 2*s.* 6*d.* a day, and in Devonshire 1*s.* 8*d.* a day, the former would do for 7*d.* the same amount of work as the latter for his 1*s.* 8*d.*"

Bark stripping.

167. Both in parts of Hants and of Devon there is a good deal of money earned in the season of "bark-stripping" or "rinding." In Hants, a man can earn 4*s.* a day at felling oak and bark-stripping.

Acorn-picking.

168. In the course of last autumn a considerable amount of money was earned by women and children at acorn-picking; it was a second harvest for them. I heard of families gathering from 60 to 100 bushels, which they sold at 1*s.* a bushel; the price varied from 8*d.* up to 1*s.* It was doubtless an exceptional year, and I only mention this to show, that in looking at the question of the possibility of an agricultural labourer putting by any money, or being able to forego the weekly earnings of his little children, there are ways and means by which the income of the family is increased, and that it is not only on his weekly wages that he has to depend. And beyond these fortuitous sources of income, there is throughout the district which I have this year visited generally a garden of a fair size attached to the cottage, and in some cases a piece of allotment ground in addition, to be had at a reasonable price. They are both of great value to the labourer, but where the position of the cottage admits, there is no doubt that the garden is preferable.

Additions to labourers incomes.

Potato ground.

169. The system of giving a certain quantity of potatoe ground in the field of the farmer, when free to the labourer, is also a benefit; it is usually manured for him. Sometimes, if he hires it, he puts on the manure of his pig in lieu of rent. Even when he has to pay 1*s.* a yard for it, it was considered an advantage to get it. This is one of the much-talked-of "privileges" of the Devonshire labourer, which is, I believe, *really* a privilege. As to the cider and the grist I am not of that opinion.

Lace making.

170. As inquiries have already been made in the lace-making district of Devon, I need not refer to it further than to say that education is there at a very low ebb, especially among the women, the girls being taken away from the day school at 7 and 8 years of age to be sent to the lace school.

General Remarks and Conclusion.

171. It only remains for me now to sum up, as best I can, the bearing of the evidence on the question of applying to agricultural employment the principles of the Factory Acts, and to make such suggestions as are justified by the facts and opinions that I have gathered during the period in which I have conducted this inquiry as your assistant commissioner.

172. The principal object being the securing a better and more continuous education for the labourers' children, it seems to me that the first step is to prevent the withdrawal of children from school at an early age, and for that purpose I think that the age of 8, as fixed by the Agricultural Gangs Act, is too young, and that they might without injury be forbidden to work in the fields, except at hay time and harvest, before the age of 10. I would, however, to a certain extent, modify this suggestion.

173. The age at which boys are first taken into permanent farm service varies in different counties, as do the requirements, at certain seasons, of juvenile labour for some operations of the farm. I would, therefore, venture to suggest, that if legislation takes place on this point, power shall be vested in magistrates at petty sessions, or in such other authority as may seem best, to give permission for the employment of children under 10, on its being clearly shown, that for a limited period their labour is really necessary for certain farm operations, such as weeding corn, stone-picking, &c., which require to be done with rapidity and within a given number of days. Where the supply of hands is sufficient, the alternate day system might, perhaps, here be adopted with success by the united action of the school managers and the farmers; but, in any case, due precaution should be taken not to interfere too much with the attendance at school.

174. There is, however, I fear, too much reason to doubt whether the mere prohibition of working in the fields will secure the attendance at school. In the case of well-disposed parents I believe the boys would be sent to school, but with the indifferent and the careless some form of compulsion or quasi-compulsion may be found necessary. By quasi-compulsion, I mean the requirement of the production of a certificate of a given amount of school attendance before hiring, or some other inducement to the parent to consider the ultimate benefit to his child of a good plain education.

175. One of the causes of apathy on the part of the labourers in the agricultural districts in the matter of education is well put by the Rev. Sir St. Vincent Hammick:—

"There is a want of some premium to be held out to well-educated boys in agricultural districts; in mines or factories there are places of trust and prospects of promotion which act as a spur."

176. At present it would seem that the better educated lads do not remain on the farms; it might therefore be possible that by the stimulus of a certificate, or by a graduated scale of wages according to the value of the labour supplied or of the capability of the lad to take a place of greater trust, some further encouragement would be given to education, while, at the same time, the employer would not lose, as he now does, the services of those who by their education are capable of being more useful to him than the uneducated.

177. There is a growing feeling among the farmers in favour of having their labourers residing in good cottages on their farms. I think this feeling is not to be attributed solely to the known advantages of the man being close to his work, or of his being more absolutely under the control of his master, but that there is this higher reason for it, viz., that the employer is well aware of the great advantage of having a labourer attached to his farm, not only by the ties of home, but also by the existence of a mutual understanding and good feeling beween man and man. To promote this, it is surely desirable, I might say necessary, that the labourer should be educated so as to take more interest in the matters of his daily life, and not merely to consider that life as purposeless beyond the earning of so much a day.

178. But the mere school attendance up to 10 years of age will not effect this. It is clearly shown that those lads who go to farm service at that age, and have either no opportunity or no desire to continue their education, soon forget all they have learned. It is, then, well worthy of careful consideration how this evil can be avoided.

179. The night-school appears to afford the easiest solution, at any rate for the older lads from 13 years and upwards. Between the ages of 10 and 13 years, it may be that the usages of many counties would *now* permit of the attendance of boys at school for a given number of times during the year; certainly I think in Yorkshire such a system might well be adopted, perhaps, also in Devon and Cornwall, and probably if such attendance was required by law, many of the difficulties would be found to be imaginary.

180. Such attendance may, as a rule, be obtained in the winter months, when the labour of children, not being yearly farm servants, is but little required; and I am quite sure that it is most desirable that, be the number of attendances in the year 150, as proposed by Lord Shaftesbury, or 100, as shown by the evidence (No. 244), to be more feasible, such attendances should be as regular and continuous as possible. As I have already said, the night schools are not at present well attended. More aid is wanted for the teaching power, more inducement to the lads to come and be taught. Too much depends now on personal attachment to the clergyman or the teacher. The success of the night school at Walton in Yorkshire, and of the art classes at Gulworthy in Devon, shows that, if other subjects than the mere routine of reading, writing, and arithmetic are introduced, if some trouble is taken to meet the tastes of individuals, and to allow them, within bounds, to study such subjects as best suit them, a great deal may be done towards improving and keeping-up the education of these older lads.

181. If attendance at night school is made compulsory, the number of attendances required must be somewhat regulated by the distance to the school, or the supply of such schools must be considerably increased.

182. In the open districts of light land, where farms are large, and the population scattered, and again, among the outlying hamlets of the south-western counties, it might be possible, by a system of grouping, and by a travelling teacher, to bring to the doors of these lads the means of education. It is hardly to be expected, that in bad winter weather, and after a hard day's work, they will go any great distance to the school.

183. The education of girls differs widely from that of boys. The latter must be trained for his out-door occupation at an age when he is amenable to discipline, and must begin at a reasonably early age to learn that on which his future existence as an agricultural labourer depends. Girls should not, for their own good, be employed in the fields at all; and I think it might fairly be laid down that no girl shall be employed in farm work before 13 years of age; some think they should not begin before 16. It is most desirable that they should not acquire a taste for the so-called "liberty" of field work, as it is clearly shown by the evidence of old field-working women that things at home do not prosper when the wife is absent all day from the cottage.

184. I have already referred fully to the cottage question.

185. I have endeavoured to keep as closely as possible to the main object of this inquiry, and to set before you facts bearing upon it, as well as the opinions of those, in their particular districts, who were thought to be best acquainted with the present condition and with the requirements of the agricultural labourer.

186. In conclusion, I beg to express my best thanks to all those in every class, who, by their hospitality, by their courtesy, and by their willingness to aid me in my work, have enabled me to present to you what, I trust, is a fair and truthful report on the subject which you have entrusted to me.

I have the honour to be,
Gentlemen,
Your obedient servant,

EDWIN B. PORTMAN.

3, King's Bench Walk, Temple,
July 20, 1869.

REPORT.—By Mr. F. H. NORMAN.

INDEX TO REPORT.

[The figures refer to the paragraphs of the Report.]

1. Counties visited, and time occupied.
2. Object in view.
3, 4, and 5. Evidence obtained; number of circulars distributed and returned.
6. General condition of counties examined.
7. Herefordshire; glove trade; orchards; hops.
8. Surrey; effect of being near London.
9. Effect of large commons in West Surrey.
10. Market gardens; medical herbs.
11. Size and shape of parishes.
12. Warwickshire; agricultural and manufacturing districts; failure of ribbon trade.
13. No peculiar crops grown.
14. Wiltshire; the chalk district; size of farms; all the population concentrated in the valleys.
15. The grass district.
16. Wiltshire formerly a manufacturing county; now overstocked with labour.
17. Worcestershire; manufactures.
18. Orchards; hops.
19. Gardens.

LABOUR.

20. Private gangs not employed.
21. Ordinary employments of women.
22. Special employments of women.
23. Chiefly married women; Irish women.
24. Women less disposed to work than formerly.
25. Less wanted on account of machinery used; in-door work preferred.
26. Hours of work; meal-times.
27. Wages.
28. Health good; turnip cleaning and washing carrots objectionable; cottages of field workers; children burnt.
29. Restrictions proposed on the employment of women.
30. No restriction necessary.
31. Age at which boys are first employed; continuously; intermittently.
32. Employment of girls.
33. Age at which farmers require boys.
34. Work in which children are employed; ordinary occupations; special occupations.
35. When not employed by farmers.
36. Boys anxious for work.
37. Mode of hiring.
38. Earnings of boys.
39. Health of children.
40. Work done on Sundays; shepherd boys.
41. Hop cultivation.
42. Hop tying.
43 and 44. Hop picking.
45 and 46. Lodgings for pickers.
47. Food.
48. Earnings of labourers.
49. Cider allowed.
50. Shepherds, carters, and milkers.
51 and 52. Extra money earned by piecework, &c.
53. Earnings in Wiltshire.
54. Purchasing power of earnings.
55. Wages, when paid.
56. Rise of wages in Wiltshire.
57. But labourers unsettled.

EDUCATION.

58, 59, and 60. What amount can be considered satisfactory.
61. The actual state of education.
62. In Herefordshire.
63. In Surrey.
64. In Warwickshire.
65. In Wiltshire
66. In Worcestershire.
67. Many parishes where education satisfactory.
68. To what causes defect is due.
69, 70, and 71. Supply of schools generally sufficient.
72. Boys older where certificated masters are employed.
73. But not the sons of agricultural labourers.
74. Some think that the education given is bad in kind.
75. Fees not too high.
76. Parents unwilling to forego children's earnings.
77. Work done by children for parents.
78. Indifference of labourers.
79. Of farmers.
80. Of landowners.
81. Two main obstacles to education.
82. Remedies.
83. The building of schools should be encouraged.
84. Opinions as to school rates.
85 and 86. Where schools should be placed.
87. Itinerant masters.
88. Supply of teachers; very few certificated teachers in country schools.
89. Remedy suggested; registered teachers.
90. Low fees should not be charged.
91. Some think present advance in education sufficiently rapid.
92. But main obstacles are not being removed.
93. Suggestions for securing regular attendance; various forms of part time.
94. Night schools.
95. No system of partial attendance likely to be successful it requires inspection, which is impossible in agricultural districts.
96. If enforced, farmers would not employ boys to whom it applied.
97. Only feasible plan would make permission to work depend on the proficiency of child.
98. Practical mode of enforcing the suggestion; amount of education to be required; should there be a minimum age?
99. Where, and by whom should certificate be granted.
100. Up to what age certificate should be required.
101. Those mentally deficient should be excepted.
102. On whom penalty should fall.
103. Informers might have half the penalty.
104. Should law apply to those only who are directly employed by farmers?
105. This plan would encourage early and regular attendance; would encourage children to work by themselves.
106. Objections to this plan; said that it would reduce all to one level.
107. Would be unfair to those who live at a distance from a school.
108. Harvest and hop-picking should be excepted.
109. This scheme generally supported.
110. Would not cause serious inconvenience to either farmers or parents.
111. Grant should be higher for the upper than for the lower standards.
112. Industrial school at Ockham.
113. Gardens at Godstone, Bowood, and Hagley.
114. Carpenter's shop.
115. Not sufficient time for industrial instruction.
116 and 117. Training schools at Savernake and Calne.
118. Pauper children should be boarded out.
119. Two Acts now optional should be made compulsory.

COTTAGES.

120. Three classes of cottages.
121. Those belonging to landowners.
122. Those built by speculators.
123. Those built by labourers.
124. Rent; situation and accommodation of cottages.
125. Opinion of doctors as to cottages.
126. Better drainage much needed
127. Allotments; large amount of land held at Burbage and at Bowood.
128. Cottages let to farmers; only sufficient for the principal servants should be so let.
129. Terms for which cottages are let.
130. Small Tenements Rating Act might be extended; power given to borrow money on leases, and to improve old cottages.
131. Cannot be built on self-supporting terms; labourers do not value good cottages.

132. Said that no direct return should be expected from cottages; if so, none but wealthy landlords can have good cottages; it is a mistake to charge low rents; money would be better spent in raising the character of the labourer.

Miscellaneous Subjects.

133. Friendly societies; the Wiltshire Friendly Society.
134. The North Warwickshire Friendly Society; Becher clubs.
135. The effect of registration often misunderstood; proposals for improving friendly societies.
136. The poor law diminishes the inducement to belong to clubs.
137. Mops; fewer servants are hired there than formerly; registration offices have failed; proposal for improving mops.
138. Public houses.
139. Conclusion.

To Her Majesty's Commissioners.

Gentlemen,

1. Since presenting to you my report on Northamptonshire in July 1868, I have, in further obedience to your instructions, visited successively the counties of Surrey, Wilts, Warwick, Worcester, and Hereford. I was occupied in making inquiries in Surrey for 34 days, during the months of June, July, and August 1868; in Wiltshire for 46 days, during the months of September, October, and November 1868, besides four days in January 1869; in Warwickshire for 36 days, during November and December 1868, and January 1869; in Worcestershire for 24 days in February and three in May, and in Herefordshire for 31 days in April and May of the present year. Counties visited. Time occupied.

2. I have endeavoured to collect reliable evidence as to the condition of the agricultural* labouring class in the various districts of these counties, and I have caused to be printed in the Appendix to this Report such portions of the evidence thus collected as I think will be sufficient to convey a tolerably accurate idea of what that condition is. Object in view.

3. The greater part of the evidence I have collected has consisted of verbal statements obtained in conversation with persons of all classes, but in addition to these statements I have distributed a considerable number of the printed circulars of questions with which I was provided to gentlemen who I was informed were able and willing to supply the information asked for. I distributed 36 of these circulars in Surrey, 54 in Wiltshire, 43 in Warwickshire, 17 in Worcestershire, and 19 in Herefordshire, and of these I have received 21 from Surrey, 22 from Wiltshire, 17 from Warwickshire, 11 from Worcestershire, and 7 from Herefordshire. Evidence obtained. Number of circulars distributed and returned.

4. The amount of information contained in the answers contained in these circulars varies very much. Replies which are substantially similar are often given to particular questions in a great number of the returns sent in. I have not thought it necessary to have the whole of these replies printed; I have therefore made a selection which I think fairly represents every class of opinion expressed in each county. The answers so obtained are printed in Appendix E. to this Report. Lastly, I attended meetings of the Chambers of Agriculture at Swindon, Warwick, Worcester, Upton Snodsbury, and Hereford, as well as a large meeting of landowners, clergymen, and farmers specially convened by Mr. J. Ravenhill, at his house at Ashton Gifford. At each of these meetings the principal questions I now have to report upon were discussed.

5. Before proceeding to lay before you the results of the evidence which I have collected, and of my own observations, it will probably render what I shall have to say more intelligible if I give a short description of each of the five counties I have visited, touching upon those points only which affect the condition of the agricultural labourers and the employment of women, young persons, and children in agriculture. I will throughout this Report when alluding particularly to the five counties, refer to them in alphabetical order, and it may be assumed that my observations apply generally to the five counties, unless it is expressly stated that this is not the case.

6. The general condition of these five counties, as regards acreage and population, may be gathered from the following table, taken from the census returns:— General condition of counties examined.

County.	Acreage.	Total Population.		Population engaged in Agriculture.					
				1851.			1861.		
		1851.	1861.	Male.	Female.	Total.	Male.	Female.	Total.
Hereford - - -	534,823	115,489	123,712	11,627	706	12,333	10,822	682	11,504
Surrey - - -	478,792	683,082	831,093	18,432	161	18,593	18,890	196	19,086
Warwick - - -	563,946	475,013	561,855	19,457	907	20,364	19,830	635	20,465
Wilts - - -	865,092	254,221	249,311	31,396	5,747	37,143	29,344	4,784	34,128
Worcester - - -	472,165	276,926	307,397	13,946	1,345	15,291	15,138	1,542	16,680

From this table it appears that, according to the census of 1861, Herefordshire contains only 1 person to every 4½ acres; Surrey, nearly 2 persons to every acre; Warwickshire, about 1 to every acre; Wiltshire, 1 to about every 3½ acres; and Worcester, 1 to about every 1½ acres.

It appears, also, that between the years 1851 and 1861, the population of the four counties of Hereford, Surrey, Warwick, and Worcester rose, while that of Wiltshire alone fell; the number of males employed in agriculture fell in the counties of Hereford and Wilts, and rose in the other three; but the

* It has formed no part of my duty to inquire into the condition of the manufacturing population, and I have not done so; occasionally, however, the existence of some particular manufacture in a district has an indirect effect upon the employment of women and children in the fields, *e.g.*, where women can get glove work to do they will not generally go out to field work. It is necessary therefore for me to allude to those manufactures which have an indirect bearing upon the agricultural labour.

I.

number of females employed fell in the counties of Hereford, Warwick, and Wilts, and rose in Surrey and Worcester. The total number of females employed in agriculture in these counties was, in 1851, 8,866; and in 1861, 7,839.

Herefordshire. Glove trade. Orchards. Hops.

7. Herefordshire is a purely agricultural county, and is very thinly peopled. In the western portion of the county some few of the wives and daughters of the labourers are employed in making gloves for Worcester tradesmen. A considerable quantity of the county is devoted to the cultivation of apples and pears, a large orchard being attached, as a general rule, to every farm. Hops are extensively cultivated in the centre of the county. The hop district may be roughly described as bounded by a line running from Tenbury through Pembridge to Eardisley on the north-west, and thence following generally the course of the Wye to Hereford, and thence in a south-easterly direction to the borders of the county. The quantity of hops grown by each farmer is not large, frequently not more than four or five acres, although almost every farmer in the hop district grows a few, and a few farmers large quantities. The cultivation of this crop, both in this county as well as in Worcestershire and Surrey, gives considerable employment to women and children, the nature of which will be hereafter more particularly described.

Surrey. Effect of being near London.

8. The county of Surrey is much affected by its immediate contiguity to London; that portion of the county which lies to the east of Chertsey, Leatherhead, and Dorking, cannot be looked upon as a purely agricultural district. The number of houses occupied by gentlemen who live there in order to be near London is very large, and the opportunities for obtaining employment as gardeners, grooms, &c. gives unusual chances to the male portion of the labouring class to improve their position, while the women are often able to obtain occupation by washing or charring, and thus add to the earnings of the family without being obliged altogether to abandon the superintendence of their own homes.

Effect of large commons in West Surrey. No serious loss to labourers occasioned by enclosure of commons.

9. The western part of the county is distinguished by extensive barren heaths and commons. The existence of these commons has given opportunities to a large number of squatters to erect cottages on the waste land. When first put up, these cottages are of the poorest class, but they are often sold after a time by their original proprietors to persons who either repair them or substitute for them decent dwellings. The squatters have always been accustomed to cut turf for fuel, and to turn out donkeys, geese, &c. on the commons. Many of the commons have been enclosed in the last few years, and consequently these rights have been lost. I endeavoured to ascertain whether the loss of these common rights had entailed any substantial sacrifice upon the class to whom they formerly belonged, but after having had frequent conversations both with the labourers themselves and with gentlemen well acquainted with the condition of the labouring class in this district, I am inclined to think that the squatters have no substantial ground of complaint on this score. Before the enclosure of the commons, few of them worked regularly as farm labourers, but relied mainly upon the produce of their own gardens and of the commons on which they lived for their maintenance. Their means of existence was somewhat precarious. Now they are more disposed to take work as regular farm labourers, and their means of livelihood are consequently more certain. The loss which they have suffered from not being permitted to cut turf for fuel is in a great measure compensated for by the saving of labour and by the superior quality of the fuel which they purchase in the form of coal.

Market gardens. Medical herbs.

10. In addition to the ordinary agricultural crops, some special crops are grown in Surrey; these consist of a vast quantity of vegetable produce grown in the neighbourhood of London for the supply of the London market; of carrots, which are grown to a considerable extent at Godalming and Chertsey; of medical herbs grown at Mitcham and Carshalton; and of hops grown in the neighbourhood of Farnham, as well as on the borders of Kent, those grown in the former place being noted for their superior quality.

Size and shape of parishes.

11. Another peculiarity in the county of Surrey is the size and shape of the parishes. Some of these are very extensive; *e.g.*, Worplesdon is 11 miles long, while Godalming is 17, but has been divided into various ecclesiastical districts. Most of the parishes situated on the edge of the chalk hills comprise portions of lands upon the hill and in the valley. These parishes thus form long strips; *e.g.*, the parish of Abinger is nine miles long and half a mile broad.* I mention the peculiarity in the extent and form of these parishes for the purpose of drawing attention to the difficulty which thus arises in providing them with school accommodation. Parishes are generally treated separately for educational purposes, but this mode of treatment is very inconvenient when applied to such parishes as those I have described. I will allude to this subject again hereafter.

Warwickshire. Agricultural and manufacturing districts. Failure of ribbon trade.

12. The great bulk of the county of Warwick consists of rich highly farmed agricultural land. The southern portion of the county is entirely devoted to agriculture, but in the north are to be found the vast manufacturing towns of Birmingham and Coventry. In the agricultural parishes around Coventry considerable number of persons were formerly employed in the ribbon trade. The failure of this manufacture has deprived this portion of the population of their usual means of livelihood, and has consequently increased the number of applicants for agricultural employment. It seems, however, impossible for persons who have devoted the greater part of their lives to factory labour to compete successfully in farm labour with those who have been engaged in it all their lives.

No peculiar crops grown.

13. No peculiar agricultural crops are grown in Warwickshire which call for special notice, and the only domestic manufacture in the county is that of needles, which is carried on to a small extent in the neighbourhood of Alcester.

Wiltshire. The chalk district. Size of farms.

14. Wiltshire may be divided into the two distinct districts of the chalk and the secondary beds below it, which are generally known as the grass district. A line drawn across the county from Swindon in a south-westerly direction to Westbury will separate these two districts, the south-eastern district forming the chalk, and the north-western the grass. The chalk district is intersected by several valleys, the principal of which are the valleys of the Avon, the Wiley, and the Nadder. The soil in the chalk district varies from the richest water meadows, which form the bottom of the valleys, and which command a rent of 4*l.* or 5*l.* an acre, to the poorest downs which comprise the upper part of the chalk hills, and for which a few shillings only can be obtained. Between these two extremes, land of every degree of fertility is to be found. The farms are very large; one of 500 acres would be considered small. Many of 1,000 acres, and some of 1,500 or even 2,000 are to be met with.

* I give the statistics as to the size of these parishes, which were given to me at the places referred to. I believe them to be substantially correct, but cannot vouch for their precise accuracy.

I.

Almost the entire population of the chalk district live in villages which are built in the valleys on the rivers. Some few live in scattered cottages on the downs, and the number of these cottages has of late years been increasing, owing to large quantities of the downs having been broken up. More cattle are kept now than formerly; many of these are kept in small homesteads, and require the immediate superintendence of farm labourers; but on the whole, the proportion of the population who live in the scattered houses on the downs is very small. All the population concentrated in the valleys.

15. The best grass land is to be found in the valley of the Avon, in the neighbourhood of Melksham, Wootton Bassett, and Malmesbury; the district to the west of this is mainly arable. In the northern part of the county the farms contain from 100 to 500 acres; the cottages are not generally collected in villages, as is the case on the chalk, and the simple operation of making cheese causes a less demand for labour than the constant preparation of the land for a succession of agricultural crops. The grass district.

16. There can be no doubt that the county of Wilts, when compared with other counties, occupies a far less important position now than it did some time (say a century) ago. The woollen cloth and silk manufactures were formerly actively carried on; these manufactures are now conducted on a far less extensive scale, and many factories have been altogether closed. This change has, I presume, been caused by the greater facilities offered for carrying on manufactures in counties where coal is cheaper; but while the change has been going on, no new manufactures, except the railway works at Swindon, have been started in Wiltshire to give employment to those thus thrown out of work, and the surplus population has had to look to agriculture alone for their livelihood. The decrease in the importance of Wiltshire may, to some extent, be measured by the operation of the first Reform Bill. By this Bill, seven* boroughs in the county, which formerly returned two members, were totally disfranchised; four† other boroughs, which formerly returned two members each, were deprived of one member each. But, on the other hand, the number of county members was increased from two to four. The result of these operations was that the county was deprived of 17 of its representatives. The inference which I draw from these facts is that the labour market in Wiltshire has of late years been, and is now, overstocked, and that the wages in that county have consequently been low. Formerly a manufacturing county. Now overstocked with labour.

17. The county of Worcester presented greater varieties than any other county which I have visited. The whole of the northern portion is rich in manufactures, while in the neighbourhood of Bromsgrove a large population, male and female, is employed in the nail trade; and in the neighbourhood of Redditch many women are employed in making needles. The glove trade is carried on to a great extent near Worcester, and great numbers of the female part of the population, more particularly towards the Herefordshire border, are constantly employed in it. Worcestershire. Manufactures.

18. Orchards are everywhere to be met with, and cider usually allowed to all farm labourers, except just in the south-western portion of the county. The cultivation of hops is carried on extensively in the valley of the Teme and its immediate neighbourhood, under conditions very similar to those which regulate the cultivation of this crop in Herefordshire. Orchards. Hops.

19. In the neighbourhood of Evesham and Pershore the richness of the soil affords ample opportunities for the cultivation of fruit and vegetables on a very large scale. A great number of these gardens are only a few acres in extent, and are occupied by men of small means; in such cases the necessary labour is mainly supplied by the family of the occupier. In these, and to a less extent in the larger gardens, women and children are extensively employed. Gardens.

Labour.

20. In the circulars of printed questions, a private gang is defined to be "a group of children, young "persons, and women in a farmer's own employ, and superintended by one of his own labourers." In none of the counties which I have visited have I found it the general custom to employ women and children in this manner. Occasionally a few boys or women, possibly six or eight, are sent out to work together in the field under a superintendent, male or female (A. 38, 106, 108, 113, D. 23), but this system is quite exceptional. In one only of the circulars of inquiry which have been returned is the existence of private gangs recognized, and that is at Harvington in Worcestershire, where a number of women are employed for the purpose of picking peas. This form of labour, however, hardly falls within the definition given of a private gang, because the women so employed are engaged by the dealer who buys the peas, and not by the farmer who grows them. Private gangs not employed.

21. The *ordinary* employments in which women are engaged are the following:—Spring, in weeding the various corn crops, which is done either with a hoe, spade, or with the hand, picking stones, spreading manure, and sometimes in potato and bean planting. Summer, the weeding of the corn crops as well as turnips is continued, after which the hay and corn harvest, about which no information is asked, gives ample employment for women. Autumn, acorn picking, potato gathering and weeding. Winter, women are very little employed, but are sometimes engaged with the threshing machines, or in pulling up and cleaning turnips or mangold wurzel. Ordinary employments of women.

22. The above are the ordinary employments in which women are engaged, wherever no exceptional crops are grown; but in addition to these I have found special employments exist for women in almost every county I have visited. In Herefordshire, Worcestershire, and Surrey they are employed in tying hops to the hop poles in May and June, and in hop-picking in September. Wherever there is much wood, as in the south of Surrey, in Worcestershire, and in Herefordshire, they are occasionally employed in stripping bark at the end of April and the beginning of May. In Surrey they are also employed in washing carrots in winter, in the neighbourhoods of Guildford and Chertsey; and in the medical herb gardens at Carshalton and Mitcham, they are employed in transplanting the plants in spring, and in assisting to harvest them in autumn. In the neighbourhood of Evesham they are largely employed in the fruit and vegetable gardens during the spring and summer. Special employments of women.

23. It will be seen from looking at the tables printed in the Appendix (E. 2) that far more married than single women go to field work, and I was told that when a woman marries, her husband expects Chiefly married women.

* These were Old Sarum, Ludgershall, Hindon, Great Bedwin, Heytesbury, Wootton Bassett, and Downton.
† These were Westbury, Wilton, Malmesbury, and Calne.

I.

Irish women.

her to contribute towards the maintenance of the family (A. 63). In Surrey very few of the native women go to field work, except during the hay and harvest time. There are, however, a great number of Irish women to be met with in this county, as well as in the north of Warwickshire and Worcestershire (A. 18, C. 130), who work a great deal in the fields, and make very efficient labourers. In the market gardens near London they are extensively employed.

Women less disposed to work than formerly.

24. There appears to be, almost everywhere, an increasing disinclination to field work on the part of women (A. 30, A. 35, E. 12). Those whom I visited and talked to often told me that although they themselves had always been in the habit of working they had made up their minds that it did not answer, and that they would not encourage their children to take to it. They seem to be arriving at a conviction that where a cottage is to be kept clean and tidy, and a family provided for, the whole time of the mother of the family should be spent indoors, and that the money she can earn by going into the fields is insufficient to compensate her for the necessary loss which is occasioned by her absence from home.

Less wanted on account of machinery used.

25. In addition to this, the increased use of machinery renders the employment of women unnecessary in many occupations in which they were formerly engaged. Wherever indoor work is to be obtained women always prefer that to going out, consequently where the glove trade is carried on, and in the neighbourhood of towns, where washing can be obtained, but few women will be found in the fields.

Indoor work preferred.

Hours of work.

Meal-times.

26. Their hours of work are generally from 8 to 5; they have an hour for dinner and sometimes half an hour for breakfast, or, as it is called in Herefordshire, "bait," and if the hours of work are extended to late in the evening, as is often the case at haymaking, they generally rest half an hour in the course of the afternoon.

Wages.

27. Their wages are sometimes as low as 6*d.* a day (D. 1), but generally 8*d.* or 10*d.*, and 1*s.* during haymaking. I found in Surrey some women who were being paid as much as 1*s.* 6*d.* a day for making hay. The women who work in the medical gardens receive 1*s.* 3*d.* to 1*s.* 6*d.* a day.

Health good.

28. The health of the women who work in the fields is generally good; in fact, many of them like field work, because they consider it so much more healthy than passing their whole time in their cottages.

Turnip cleaning and washing carrots objectionable.

The employment which is most objectionable for them is cleaning turnips and washing carrots (A. 23, 41, C. 8); this work has to be done in the winter, and the women while so occupied are exposed to cold and wet, which is calculated to bring on rheumatism and erysipelas, but I have not found that the work done by women is anywhere of so excessive a kind as to be the necessary cause of physical injury to them.

Cottages of field workers.

The opinions of the gentlemen with whom I have communicated are divided as to whether or not the cottages and families of the field-workers are less well cared for than those of women who do not work in the fields. I have collected much evidence on both sides of the question.

Children burnt.

I have been told by two medical men that cases had often occurred within their experience of children being burnt or scalded when their mothers were at work. Mr. Bullock, of Warwick, said he had attended eight such cases, four of which had proved fatal (C. 7), and I myself conversed with a labourer and his wife, who occupied a lone cottage on the downs between Swindon and Marlborough, who told me that one of their children, whom they had left locked up in their cottage when they were out at work, had been burnt to death (A. 76), but these occurrences are very rare, considering the number of women who work in the fields; and the impression left upon my mind is that, except where a woman has a family of quite young children, the homes of those who go out to work need not necessarily be less comfortable than the homes of those who do not; the same industry and energy which induces a woman to go out to work will, in many cases, induce her to keep her cottage and children tidy, even although she may have to sit up at night to do it.

Restrictions proposed on the employment of women.

29. A great variety of opinions have been expressed to me as to the restrictions which it is desirable to impose on female labour; some think that no young women (E. 33, 34, 44, 49) or unmarried women (E. 40), or married women with families (E. 34) should be allowed to work; others that all female labour should be prohibited, except for harvest and hop work (E. 29); others that no girls should be permitted to work, except in the same field with their mothers; while one gentleman thinks that no married woman should be permitted to work unless she had a daughter of 13 who had obtained a certificate of education (E. 49); another, that women with families should not be employed at all (E. 34); and another that they should not be employed on Saturdays (A. 144). The great variety of these opinions shows how difficult it would be (assuming some restriction upon female labour to be necessary to decide what form that restriction should take; but in addition to the recommendations referred to above a great number, probably the majority of the witnesses whom I examined upon this point, expressed the strongest opinion that no restriction whatever was necessary. In this latter I myself fully concur.

No restriction necessary.

30. The field work which they perform is not of that excessive kind which was found to exist in the factories and workshops of the kingdom,* and which justified restriction in their case; and the employ-

---

* Since I completed my inquiries in Worcestershire I have received the following letter from Rev. A. H. Winnington Ingram, of Harvington, near Evesham, with reference to the employment of groups of town women in pea-picking.

My dear Sir, Harvington, July 9th.

I regret that in mentioning the private gangs of pea-pickers in my return to you as Commissioner to inquire into the employment of women and children, &c., my desire not to overstate the evil led me into the contrary error, of not laying before you the full enormity, of which, however, in justice to myself, I must state I was not at the time fully aware, or rather the evil itself had not been developed as it has been this year under my notice.

In consequence of the opening of a new line of railroad the farmers have embraced the opportunity on our land of sowing peas to be used as vegetables for human consumption. They have sold them to Evesham and Alcester market gardeners at prices varying from 10*l.* to 12*l.* 10*s.* an acre. The peas are picked by women, children, and men brought principally from Evesham and Alcester in carts. Some gangs have consisted of about 40 women and children, and men in smaller proportions (one Evesham gardener has now a gang of 140). There is one field of peas in this parish being picked by about 60 women and children and men (in smaller proportions). They are brought into the parish in large carts about 5 o'clock in the morning, and go away in the same conveyances in the evening. The price of picking peas is 7*d.* a pot. The good hands from Evesham (women) pick six pots a day and get 3*s.* 6*d.* I am sorry that some of our women have been induced to work in the fields with them. They go to work later in the day, and some pick four pots.

The excitement of this new opened harvest for labour is such that my school, which generally has an attendance of between 50 and 60, is reduced to 28 children. Each child is supposed to pick one pot a day, and earn 7*d.* The language of the Evesham and

ment of women has not necessarily an injurious effect upon their morality and on their proper training for domestic duties, and therefore it appears to me that no restriction upon their employment is necessary. I.

Age at which boys are first employed.

31. The age at which children are first employed varies so much that it is impossible to state accurately what that age is. A glance at the tables printed in Appendix E. will show that but few are employed under 10 years of age. The result of the evidence upon this point may, I think, be fairly stated to be the age at which that boys commence to work regularly in farm labour is about 11 or 12 in Surrey and Herefordshire, about 10 or 11 in Warwickshire and Worcestershire, and about 9 or 10 in Wiltshire. This is a very general statement, and is subject to many exceptions. These ages refer only to the times when continuous employment first commences. There are, however, many other operations to be done on a farm which occupy only a portion of the year, and for which boys younger than the ages given above are employed.

Continuously.

Intermittently.

Employment of girls.

32. Girls are not generally employed under the age of 14 or 15 years. At that age they accompany their mothers and assist at whatever work their mothers may be engaged. In Wiltshire they work rather younger (A. 81, 106, 133). I have met with a few instances of little girls being employed in the same light work of the farm as that in which the younger boys are engaged in, but these instances are quite exceptional.

Age at which farmers require boys.

33. The great majority of farmers think that 10 is the youngest age at which boys should ever be employed. It is thought that the work which boys under that age can do on a farm is of little or no value, and that they have ample opportunity of learning the business to which their lives are to be devoted if they begin at 10. Some few maintain that unless they commence at 8 or 9 (A. 85) they never become really useful; but quite as many farmers of the greatest experience think that the age of commencing to work might be advantageously postponed until 11 or 12 (A. 39). I feel sure that an impartial perusal of the evidence I have collected will lead to the conclusion that 10 is the very youngest age at which they are wanted in any of the counties I have visited, and that the inconvenience to which farmers would be exposed would not be serious if they were not employed until somewhat older than that.

Work in which children are employed.

Ordinary occupations.

Special occupations.

34. The ordinary farm operations in which the youngest children are employed are bird-minding, planting potatoes and beans, minding cows, sheep, and pigs, picking and gathering potatoes, and collecting acorns; they are also occasionally sent out to weed, but as a general rule the weeding is done by men or women. The special occupations in which they are engaged are hop-picking, at which children of all ages are employed in every district in which hops are grown; apple-picking, *i.e.*, collecting the apples and pears which have fallen from the trees. In the fruit gardens round Evesham and Pershore, in Worcestershire, children are extensively employed from the ages of 7 and 8 upwards. Their work consists in bird-minding and weeding, tying up radishes, onions, &c., and picking currants, and gooseberries, and vegetables. In fruit picking young children under 10 years of age are of but little use, as they are likely to crush the fruit and thus render it unmarketable; but as a general rule there is work to be done by children in the gardens, of one sort or another, throughout the whole summer, and education in this neighbourhood suffers in consequence.

When not employed by farmers.

35. It is important to observe in which of the above kinds of labour the children are employed by the farmers, and in which they work independently of them. In the operations of planting beans and potatoes, and in gathering potatoes, the farmer cannot, strictly speaking, be said to be the employer of the children. In these operations the work is done by contract, and the man who takes the contract generally brings his own children to assist him, and in picking acorns children work on their own account, and sell the acorns they collect to the farmers. The importance of observing this distinction will be seen hereafter.

Boys anxious for work.

36. The boys appear to be very anxious to get employment and their parents to get places for them; in fact, the pressure for employment more often comes from the labourers than from the farmers. I have been told by farmers, not unfrequently, that they have been inconvenienced by the urgent applications for employment which they have received from parents of boys, and that they would welcome any moderate legislative restriction which would protect them from this inconvenience (A. 81).

Mode of hiring.

37. Boys are generally hired by the week; the old practice of hiring by the year and boarding boys in farmhouses is gradually dying out, although it is still practised to a considerable extent in Herefordshire and Wiltshire. The discontinuance of this practice is the necessary result of the improvement which has taken place in agriculture; the farmer who now occupies 500 acres of land is quite a different person from the farmer who formerly occupied 100, his feelings and his mode of life are different, and he will not tolerate the inconvenience caused by a troop of noisy farm boys living in his house. In consequence of this change the farmhouses which are now being built are not generally provided with the accommodation necessary for boarding labourers, and however much the science of agriculture may have advanced while this change has been going on, the friends of labourers must, I think, regret the abandonment of a system which supplied farm lads with good food, and subjected them, in many cases, to wholesome control at a time when they particularly required it, and relieved the overcrowded cottages in the villages of some portion of their inhabitants.

Earnings of boys.

38. Little boys, when employed at scaring birds, minding pigs, &c., receive from 1*s.* 6*d.* to 2*s.* 6*d.* a week; when they begin to drive plough they have from 2*s.* to 3*s.* a week, and their wages are gradually raised as their strength and efficiency increases.

Boys who are boarded in farmhouses commence at about 30*s.* a year, besides their food.

Health of children.

39. The health of the children employed in the fields is generally good. I feel sure that, as a general rule, children are not employed in any of the counties to which this Report applies in a manner which is calculated to injure their health. In the opinion of many, early labour prevents the frame being fully

---

Alcester pea-picking men and women is grossly immoral. The Harvington women, accustomed to better training, work in a lot apart, but yet they can hear the gross expressions of their neighbours. Two men I hear are employed all day to keep peace among the women from the towns.

Believe me,
Yours faithfully,
A. H. Winnington Ingram.

I. developed, but I have no evidence before me to show that this is necessarily or generally the case. I have also been told by Dr. Roberts, of Salisbury, that boys suffering from heart disease, brought on by rheumatism, are constantly brought to the hospital. He attributes this disease to their being employed too young. They are attacked by rheumatism, and rheumatism when it attacks the young is more likely to affect the heart than when it attacks older persons (C. 10). Another complaint which has been made to me is that boys who are kept late in the farmhouse do not have enough sleep, and that they are sometimes severely ill-used by the carters under whose control they are placed (A. 37, E. 3, 64); but I have received no medical evidence which goes to prove that the health of the boys is seriously injured by any of the causes above alluded to.

Work done on Sundays.

40. As a general rule, no work is done on Sundays, except what is absolutely necessary, such as milking the cows and feeding the stock.

Shepherd boys.

The Rev. R. Payne, of Downton, complains, however, of the constant employment of shepherd boys on Sundays. He says that after a boy once begins to work as a shepherd boy on the downs of Wiltshire he never again has an opportunity of going to Sunday school or to church. Mr. Payne thinks that this uninterrupted employment is quite unnecessary, except during the lambing season, and recommends that it should be made illegal to employ boys under a certain age for two successive Sundays (E. 73).

Hop cultivation.

41. It seems convenient here to insert a short account of work done by women and children in connexion with the hop cultivation. Although the mode in which this crop is cultivated varies a little in different parts of the country, the work done by women and children is substantially the same in all districts.

Hop-tying.

42. During the months of May and June the hop bines have to be tied to the poles; this work is done by women, who earn as much as 10*s.* an acre, where there are four poles to the stock, and less where there are only two or three. At Bromyard they earn only 3*s.* or 3*s.* 6*d.* for two pole work. This work lasts for three or four weeks, which is the time required for the hop to grow from the ground to the top of the pole. Each bine requires to be tied three or four times at increasing distances from the ground, as it gradually rises up the pole. The women are not assisted in this work by their children, except occasionally by the older girls. This is very suitable work for women.

Hop-picking.

43. The hops have to be picked about the month of September; the operation of picking generally lasts about three weeks or a month, but varies greatly. I visited Farnham last year while the hop-picking was going on, and while there I had an opportunity through the kindness of Mrs. Paine, the owner of Dippenhall farm, of making myself acquainted with the mode in which the hop-picking is conducted. I will take Dippenhall farm as a specimen, and describe shortly the mode in which the hop-picking is carried on there. There are 200 acres of hop land on this farm. Shortly before the picking season commences pickers are collected from the neighbouring country for many miles round through the intervention of agents despatched from the farm, who again employ local sub-agents. Each agent receives 4*d.* for every "bin" for which he supplies pickers, and a portion of this he pays to the sub-agent through whose aid he has secured the service of the pickers. In due time waggons and vans are sent into all the surrounding parishes to bring in the pickers, many of whom, however, do not avail themselves of this mode of conveyance. An allowance of 1*s.* 3*d.* is made to each picker for travelling expenses and refreshment up to the time of his or her arrival on the ground.

44. At Dippenhall farm in 1868 there were 760 bins; few bins are attended by less than two adults; the number varies greatly; but you frequently find a mother assisted by a whole family, composed of five or six children, and varying from those who are bordering on manhood to the infant who is rolled in a shawl or a sack and laid upon the ground at its mother's feet. I was told that I might take 3½ as about the average number employed at each bin, and calculating upon this basis the number of pickers at work on Dippenhall farm when I visited it, would be 2,660. The usual sum paid for picking is 2½*d.* a bushel; but it varies much according to the season, and is rather higher at Farnham than elsewhere, owing to the hops being more carefully picked. Money is advanced from time to time on account; but the pickers are not finally paid until the conclusion of the picking season. Women earn on an average 2*s.* a day, but a quick picker will earn 2*s.* 6*d.* or 3*s.* (A. 32). In Herefordshire I am told that it requires a very good picker to earn 2*s.* a day; few can earn much more than 1*s.* (A. 5). Work commences at 6 a.m., and continues until about 5.30; the pickers have breakfast before they commence; there is no general pause for dinner; but the work being piecework the pickers stop for refreshment whenever and for as long as they like. Those of the pickers who live within an accessible distance usually return home every evening; the remainder sleep near the hop-ground wherever accommodation can be found.

Lodgings for pickers.

45. At Dippenhall farm the accommodation is provided in a number of large sheds. I was told that the sheds at Dippenhall farm were very favourable specimens of the accommodation usually provided for the pickers. I visited them one evening after the pickers were in bed. The beds consist of heaps of straw; a pair of sheets and a counterpane are provided for each bed by Mrs. Paine; I found it difficult to count the beds owing to their being placed so close together that I could not tell where one ended and the next began. It may be sufficient to say that the whole floor was covered with beds, except the space necessary to form pathways up and down the sheds. Most of the sheds have no upper floor, and are high and airy. Other sheds had upper floors, which were inhabited as thickly as the ground floor, and these sheds are necessarily less airy than those which had no upper floors. As a general rule, there are no offices attached to these sheds and no washing accommodation. Whatever special diseases are propagated among the pickers are, I believe, to be attributed mainly to overcrowding of the sheds in which they sleep; many of these sheds are used for farm purposes throughout the year, such as cattle sheds, storing guano, &c., and are insufficiently cleansed before the arrival of the pickers; if the picking season is over rapidly no evil consequences may arise; but when it is prolonged to five or six weeks, the sheds become foul and diseases break out. The evil consequences of this state of things is not to be looked for in Farnham alone; many of the pickers contract diseases there which do not exhibit themselves until they return home, perhaps many miles away. In a wet season the evils arising from insufficient accommodation are very much increased; the pickers clothes get wet, and they have no sufficient means of drying them. The dampness is communicated to the straw of which the beds are composed, and the straw rots.

I.

46. As a general rule, there are no partitions at all in the sheds occupied by the pickers. In one or two, however, which I visited partitions were formed by means of wattle hurdles, and in each of the portions thus enclosed two or three beds were placed; the shed when thus parcelled out presented very much the appearance of the sheep pens at a cattle market. Another shed I found divided into small apartments by means of thin temporary curtains suspended to the height of about five or six feet from the ground. Much of the hop-picking at Farnham is done by gipsies, who occupy their ordinary covered carts; the labour from one farm is completely supplied from this source, and a small encampment of gipsy carts and tents is made in one of the fields adjoining the farm premises. The sheds which I visited were occupied by men and women indiscriminately; but I was told, in Herefordshire, which I did not myself visit during the hop-picking season, that there the sexes are generally separated.

Food.

47. At Dippenhall farm a number of fireplaces have been erected for the convenience of the pickers; firewood is gratuitously supplied, and here the meals are cooked before and after the day's work. No systematic arrangement is made for the supply of provisions, but the pickers are entirely dependant upon the ordinary tradesmen for their supply of food; bread, tea, and herrings are the articles principally consumed, carts full of bread being sent every day from Farnham and the surrounding villages to the distant hop-grounds. Drunkenness is not frequent, at any rate during the commencement of the picking season; the employers find it necessary to maintain a certain amount of discipline among the pickers, and discharge those who are disorderly; but as the picking draws to a conclusion, the pickers know that their money has been earned, and then disorderly conduct becomes more frequent.

Earnings of labourers.

48. With respect to the earnings of agricultural labourers, I have obtained the following information:—

The day wages paid in Surrey vary from 12*s.*, in the western parts of the county, to 15*s.*, nearer London. In Warwickshire they are 11*s.* in the south of the county, and 13*s.* in the north (D. 14). In Worcestershire they vary from 9*s.* in the west (A. 121) to 12*s.* in the east (A. 122), and sometimes 13*s.* in the gardens around Evesham (A. 119). In Wiltshire and Herefordshire the day wages vary between 9*s.* and 11*s.* In addition to the above wages cider is universally allowed in Herefordshire and Worcestershire, with the exception of the south-east corner of the latter county.

Cider allowed.

49. The usual allowance is two quarts a day between Michaelmas and Ladyday, and three quarts a day from Ladyday to Michaelmas, except during hay time and harvest, when the amount is practically unlimited, and I am told it is quite common for men to drink five or six quarts a day. The value of the cider thus allowed should of course be added to the wages; it costs the farmer about 3*d.* or 4*d.* per gallon. If the labourers had to buy it at a public-house it would cost them at least double that sum; at the former price the value of the cider to the labourer would amount to about 1*s.* a week on an average throughout the year, and at the latter price to 2*s.* Cider does not appear to be an unwholesome drink (C. 1). Rheumatism is a very prevalent disease in both Herefordshire and Worcestershire, but it is doubtful whether this is caused by cider. Calculus is very rare. But whatever the effect of cider upon the health may be, there can be no question that the practice of receiving so large a portion of the family income in cider, which is consumed by the father of the family alone, shows great extravagance on the part of the labourers.*

Shepherds, carters, and milkers.

50. Shepherds and carters generally receive about 2*s.* a week more than common day labourers, and often extra allowances besides; on large farms shepherd's and carter's places are sometimes of great value, amounting to as much as 17*s.* or 18*s.* a week, including everything (A. 2, 15, 17, 112). The milkers on the dairy farms in Wiltshire generally have an extra 1*s.* per week, because they are obliged to work on Sundays.

Extra money earned by piece-work.

51. To the above common day wages should be added the money earned at harvest and by piecework. The amount of this money of course varies with the strength and dexterity of the labourers, as well as with the opportunities they have of doing piecework, much more work being done by the piece on some farms than on others. I think that the money so earned would amount† to from 1*s.* to 2*s.* per week if spread over the whole year (see as to Surrey, (A. 38, 44), as to Warwickshire (A. 14, 16, D. 18, 20), as to Worcestershire, (D. 39, 40, 41, 47,) as to Herefordshire, (D. 1,) as to Wiltshire (A. 117, D. 22, 32, 39).

---

* As an instance of the opinions of labourers themselves on the cider question I may refer to the statement made to me by a gardener in the employment of Mr. Varden at Peopleton (D. 46).

† I made an effort to obtain accurate returns of the precise number of women and children employed, and of the amount of their earnings. With this object in view I distributed schedules to be filled up by farmers in the several counties which I visited. Unfortunately the number of these which have been sent back to me is insufficient to enable me to make any comparative calculation of the cost of cultivation and the earnings of labourers in different counties. The only county from which I have received a sufficient number of returns to be of any value is Warwickshire, and in this county my success has been mainly due to the exertions of Mr. Thomas Horley, jun., of the Fosse, Leamington. From these returns it appears that on the 1,845 acres of arable and 1,245 of grass land, total 3,090, to which the returns apply, the following staff of labourers is employed:—

	£	*s.*	*d.*	
Males.				
94 over 18, who earn	3,533	18	0	per annum.
13 between 18 and 13, who earn	265	0	0	„
14 between 13 and 10, who earn	139	14	0	„
5 between 10 and 8, who earn	29	14	0	„
Females.				
[1]Over 18 (married), who earn	144	8	0	„
5 over 18 (unmarried), who earn	70	16	0	„
1 between 18 and 13, who earns	7	0	0	„
	4,190	10	0	
Extra for beer or cider, &c.	311	0	0	
Total cost of labour	4,501	10	0	

= about 1*l.* 9*s.* per acre.

It appears also from this table that the average earnings of every male over 18 years of age amounts to about 37*l.* 12*s.* per annum.

[1] I am unable to give the number of married women employed, as the returns are imperfect on this point.

I.

52. In addition to the above earnings, potato ground is sometimes given free or at a reduced price, fuel sometimes hauled free, and meals given when men are kept late at work. Some farmers pay their men wet and dry, and some only when the work is actually done; all these matters should, of course, be taken in consideration in considering the total earnings of the labourers; but the practices of different farmers vary so much that no rule can be laid down by which their value can be accurately estimated. When considering the money earned by piecework, it must always be recollected that the extra money so obtained is only obtained by means of a greater expenditure of time and strength on the part of the labourer, and that a proportionately increased consumption of food and drink becomes necessary. In addition to which, in many cases, the labourer has to supply himself with tools. The money so earned cannot therefore be looked upon as a clear gain.

Earnings in Wiltshire.

53. It was frequently pressed upon me by the farmers in Wiltshire that the earnings of all the able-bodied men in their employment amounted on an average to from 12*s.* to 14*s.* a week (A. 90, 92, 107, 108, 113). The farmers who made these statements to me were almost all of them rather superior men of their class. The statement does not agree with the estimate furnished by the labourers themselves of their own earnings. My own impression is that there are a great many men in the county who are able-bodied in the sense that they are not suffering from any physical infirmity (though no doubt unskilful labourers), whose earnings do not amount to more than about 11*s.* a week on an average throughout the year, including everything (D. 32, 33, 38). From this sum the rate rises gradually to 13*s.* or 14*s.* (D. 22, 28). I met with one instance of 17*s.* 9*d.* per week (D. 27). But I have not been able to ascertain what proportion of the agricultural labourers earn the lower and what the higher amount.

Purchasing power of earnings.

54. In order to form an accurate opinion as to the pecuniary condition of labourers in different districts it is of course necessary to compare the purchasing power of the money they actually receive. Two of the most important items of expense which are universally met with are rent and fuel. I will allude to the first of these hereafter when dealing with the cottage question. But I may here mention that the price paid for coal varies from 20*s.* to 25*s.*, which is paid in Herefordshire, Surrey, and Wiltshire, to from 10*s.* to 12*s.* which is paid in the North of Warwickshire and Worcestershire.

Wages, when paid.

55. Wages were formerly always paid on Saturdays; many farmers now pay on Fridays. This change is certainly advantageous to the labourers. The money is less likely to go in drink.

Rise of wages in Wiltshire.

56. There can be no doubt that the wages of all classes of agricultural labourers in Wiltshire have increased greatly during the last 25 or 30 years. Messrs. Rawlence and Squarey, of Salisbury, whose experience renders their opinion most valuable, think that the wages of young unmarried men have increased about 40 per cent., and those of older men about 10 or 12 (A. 110). The reason of this difference is that married men are less disposed to move than unmarried men, and consequently demand a smaller sum as an inducement to remain in one place.

But labourers unsettled.

57. Notwithstanding this increase in their wages the labourers in Wiltshire appear to be in a more unsettled and dissatisfied condition than in any other county I visited. I received numerous complaints from farmers in all parts of the county of the difficulty they experience in getting good steady men to remain with them; "directly we find fault with a man," they said, "he leaves us." The farmers attribute this dissatisfaction on the part of the labourers to increased education. I believe the real explanation of it to be that the county is overstocked with labour, owing to the causes which I have before explained, and that the labourers are beginning to find out that more highly paid employments are to be met with in other parts of the country, and that the improved means of locomotion enables them to go where they can meet with these higher wages.

Education.

What amount can be considered satisfactory.

58. I have now to state the results of the inquiries I have made with respect to the education of the young, and the first point which by my instructions I am directed to examine in connexion with that subject is the actual state of education among the young found at work. In order to judge whether their education is or is not at present satisfactory it is necessary to lay down some rule as to what amount of education may be deemed sufficient for persons occupying the position of agricultural labourers. I quite concur with the opinion expressed by the Rev. J. P. Norris (B. 14) upon this subject; he says, "I think it desirable that all children for at least five or six years of their childhood "should be brought under the civilizing influence of a good school; the actual instruction received is of "secondary importance; but as the moral and intellectual results are generally coincident, and the "latter only can be measured by examination, I am content that the schoolwork should be tested by "such a standard as that of the Revised Code.

59. "Adopting this test, therefore, I should say that the children of the agricultural labourers should "remain at school until they can pass in the 4th Standard;* in other words, a child should read with "sufficient facility to make it a pleasure in after life, should be able to work easy money sums, and

---

* As I shall have to refer frequently to the Standards of the Revised Code, it may here be convenient to state what these standards are.

Standard I.: Reading.—Narrative in monosyllables. Writing.—Form on black-board or slate, from dictation, letters, capital and small; manuscript. Arithmetic.—Form on black-board or slate, from dictation, figures up to 20; name at sight figures up to 20; add and subtract figures up to 10, orally from examples on black-board.

Standard II.: Reading.—One of the narratives next in order after monosyllables in an elementary reading book used in the school. Writing.—Copy in manuscript character a line of print. Arithmetic.—A sum in simple addition or subtraction, and the multiplication table.

Standard III.: Reading.—A short paragraph from an elementary reading book used in the school. Writing.—A sentence from the same paragraph slowly read once, and then dictated in single words. Arithmetic.—A sum in any simple rule as far as short division, inclusive.

Standard IV.: Reading.—A short paragraph from a more advanced reading book used in the school. Writing.—A sentence slowly dictated once by a few words at a time from the same book but not from the paragraph read. Arithmetic.—A sum in compound rules (money).

Standard V.: Reading.—A few lines of poetry from a reading book used in the first class of the school. Writing.—A sentence, slowly dictated once, by a few words at a time, from a reading book used in the first class of the school. Arithmetic.—A sum in compound rules (common weights and measures).

Standard VI.: Reading.—A short ordinary paragraph in a newspaper or other modern narrative. Writing.—Another short ordinary paragraph in a newspaper or other modern narrative, slowly dictated once, by a few words at a time. Arithmetic.—A sum in practice or bills of parcels.

"write and spell decently on paper. At present there can be no doubt that more than half the "children never reach this standard."

60. The opinion here expressed by Mr. Norris that the 4th Standard is the lowest which will enable the child to read and write without conscious effort has been generally confirmed by all the gentlemen most conversant with educational matters with whom I have communicated on this subject.

The actual state of education.

61. It is difficult to state accurately what the present state of education among the young is; it varies greatly in different parishes. I have had no means of taking an educational census, but I think that a tolerably correct estimate of the actual state of education may be formed from the following considerations:—

In Herefordshire.

62. The actual age at which boys leave school about corresponds with the age I have given above as that at which labour commences. In Herefordshire, as well as in Surrey, those children who have an opportunity of attending a good school and who do attend regularly up to the time they go to work, do, I think, obtain a satisfactory education, but there are many who do not go to school at all, or attend so irregularly that the education they receive is quite superficial; thus at Hentland, where there is an excellent school under a certificated master, I am told by the Rev. W. Poole, clergyman of the parish, that there were 108 children between the ages of 6 and 12 in the parish, and that of these 53 did not attend any school. The causes of absence in the case of each of the 53 children was ascertained by Mr. Poole, and is stated in his evidence (A. 12). I believe that there are many parishes, both in Herefordshire and in other counties, which, if examined, would not show a more favourable school attendance than that here exemplified. In many parishes where the schools are of a low quality, but few of those who do attend can be said to have attained a satisfactory education when they leave. Thus at Pipe-cum-Lyde I was told that the boys when they leave can generally only pass the 2nd or 3rd Standard (B. 5.); and at Withington out of 16 who left in one year only two could pass the 3rd Standard.

In Surrey.

63. In Surrey it is the opinion of the members of the Church of England Schoolmasters' Association that the children leave school at about 10 years of age; many before that age. The average given from the Dorking districts is 9 years. Very few will have past out of the 4th Standard when they leave (B. 16). At Seale, the Rev. W. L. Beynon says, "There are many parents who from indolence and indifference "never send their children to school; even those who attend regularly are quite insufficiently educated; "they can hardly read, and writing is quite unknown among them. When they come to a confirmation "class they can hardly get through the service" (A. 42); and the Rev. G. Drury, at Thorpe, says, "25 attended my night school last year: that number comprised nearly all in the parish between the "ages of 13 and 18, and out of that number nine who are in the choir are sufficiently educated, of the "remainder four could not read, seven could read a little, perhaps 2nd Standard; the other five could "read about 4th Standard. Perhaps one-third could not write well" (A. 43). This evidence is fully confirmed by that of the Rev. G. Chilton, of Wanborough (A. 44), the Rev. F. C. Fitton, of Bagshot (A. 45a), by Mr. Harrison, of Woldingham (A. 46). As before remarked, the configuration of the parishes and the extensive commons which exist in parts of Surrey offer a serious objection to education; thus, Mr. Mousley, schoolmaster at Cranleigh, says, "Only a small proportion of the children who live "in the distant cottages come to our school; those who do come often come at age of 7 and 8, and "don't know their letters" (B. 11).

In Warwickshire.

64. In Warwickshire it is the opinion of the members of the Church Teachers' Association, that "the "age of children leaving school is under 10 on the average, and that the progress they usually make is "between the 3rd and 4th Standard" (B. 20).

In this county the school age terminates, I think, rather earlier than in Herefordshire or Surrey, and the state of education is frequently defective; thus James Darlington, Esq., says, "I had many "opportunities of testing it [the education] during the recent cattle plague. I found that few of the "farm servants or labourers could read and write. Many could write only their name, and others could "not do even that" (A. 64). And I was told by James Isaacs, Esq., chief constable of Warwickshire, "that not above 1 out of 10 of those men who belong to the agricultural class, and are applicants "for employment in the police, have sufficient education to enable me to employ them" (A. 59).

In Wiltshire.

65. In Wiltshire, the members of the Salisbury Church School Masters' Association, state that the boys of the agricultural class leave school when not more than 9 years of age, when they can pass the 3rd Standard; and girls between 10 and 11, when they can pass the 4th (B. 43).

I think that in this county it may be stated as a general rule, that the 3rd Standard about marks the proficiency of the boys when they leave school (B. 38, 42); and the evidence points clearly to the conclusion that this limited amount of instruction is soon forgotten; thus, at Longbridge Deverill, where the supply of school accommodation is admirable, and the clergyman very zealous in the cause of education, 23 boys who joined the night school, of ages varying from 10 to 17, in 1867, were all placed in the 1st Standard (B. 42). At Netherhampton, where there is an endowed school, and clothes, worth at least 10*s.* a year, given away to each scholar; I was told by the schoolmistress that the boys leave between the ages of 8 and 9; they leave more often at 8 than at 9; they can usually pass the 3rd Standard when they leave; but after being absent for five or six months, have to begin again at the 1st; and that as a general rule no boy in the school could read a newspaper (B. 47). At Amesbury, where there is an excellent school, it appeared that the average age at which 40 boys, taken at hap-hazard, had left the school, was 8 years and 10 months (B. 32).

In Worcestershire.

66. In Worcestershire, the members of the Church School Teachers' Association state their opinion to be, "that the children of agricultural labourers leave school on an average at about the age of 10, at "the time of leaving scarcely any in aided schools have passed the 4th Standard of the Revised Code, or, "if in unaided schools, are able to do so; the majority are about equal to passing in the 2nd Standard" (B. 59).

The Rev. W. Lea, secretary to the Worcester Diocesan Board of Education, has furnished me with the results of the diocesan inspection. The diocese of Worcester comprises almost the whole of the county of Worcester, and all the southern part of the county of Warwick. Mr. Lea states that in the deaneries of Bredon, Evesham, Feckingham, Pershore, and Upton, out of a total number of 3,048 on the books, only 159 were equal to the 4th Standard, and also that in 24 county schools not one child reaches the 4th Standard in arithmetic (B. 52). As an instance of the indifference to education so often to

I.

be met with, I may mention the fact, stated by the Rev. A. James, of Rock, that in that parish, containing a population of about 1,000, from 28 cottages containing children of an age to attend school, none attended (A. 140). But the greatest obstacle to education in the county of Worcester arises fro m the demand for the labour of young children in the gardens near Evesham, as explained in the very interesting paper supplied by Mr. Barker, of the National schools, Evesham (B. 53).

Many parishes where education satisfactory.

67. It would not be difficult to bring forward many instances of parishes where the state of education is satisfactory; these parishes are usually the property of some large proprietor or under a hard-working clergyman, who takes an active interest in education. They must undoubtedly be looked upon as exceptions; and I think that the facts I have called attention to above will be sufficient to establish the general rule,—which, indeed, I have never found doubted by any person who has investigated the subject,—that the state of education of the young now growing up is most unsatisfactory.

To what causes defect is due.

68. It now remains to considers to what causes the defect in the present state of education is due. In the instructions issued to the assistant commissioners attention is drawn to six causes, all of which, to a greater or less extent, are answerable for the defective state of education, but in a very different degree. As a general rule, the supply of school accommodation is fairly satisfactory. I have met with very few districts in which no school is accessible.

Supply of schools generally sufficient.

69. The Rev. J. P. Norris states that he is acquainted with 400 or 500 parishes, and that, speaking generally, it may be said that half of those parishes are provided with sufficiently good schools, both as to buildings and teaching power; and that in the remainder money would be forthcoming to raise the means of education to a satisfactory condition if there were any real desire for education on the part of the poor (B. 14).

70. With seven or eight exceptions, every parish in Worcestershire is supplied with a school (B. 59).

71. In Herefordshire only two parishes with a population over 500 are without a school, but I have not been able to ascertain what number of parishes containing populations of less than 500 are without schools (A. 12); the evidence as to the supply of schools in the other counties I have visited is very similar to the above.*

* I have collected the following information with reference to the school accommodation in the five counties to which this Report refers from the "Statistics of Church of England Schools," recently published by the National Society. The very small number of parishes returned as being destitute of either separate or convenient adjoining schools fully confirms what I have stated in my Report. The very small proportion of the schools in Herefordshire (only one-fourth of the whole) which are annually aided by the State, undoubtedly indicates a low condition of education in that county. Of course I have no means of judging of the accuracy of these statistics.

PARISHES (in counties) without SCHOOLS but supplied with EDUCATION in adjoining PARISHES.

I.

72. It is a remarkable fact that the age of the first class in schools, where certificated teachers are employed, is almost always higher than the age of the first class in schools where certificated masters are not employed; this is clearly brought out by the evidence of the Rev. W. Lea, derived from the report of the diocesan inspection in Worcestershire (B. 52); Mr. Lea shows that the average age of the first class, where uncertificated teachers are employed, varies between 8 and 10½, and in those where certificated teachers are employed between 10½ and 12. It becomes important then to consider whether the children who compose the first class in the latter schools are taken from the same class of the population as those which compose the first class in the former schools.

Boys older where certificated masters are employed.

The following table will throw light upon this subject:—

Place.	In School.		In First Class.	
	Total Number of Boys.	Number of Boys of Agricultural Labouring Class.	Total Number of Boys.	Number of Boys of Agricultural Labouring Class.
Upton-on-Severn - - -	119	99	19	7
Evesham - - -	157	130	30	15
Hentland - - -	45	39	17	11
Bosbury - - -	60	45	15	12
Ashperton - -	57	51	12	8
*Bishop's Frome - -	127	88	24	12
Total - - -	565	452	117	65

This table shows that in the schools referred to, in all of which there are certificated teachers, the sons of agricultural labourers form about nine-elevenths of the whole number at school, whereas they only form rather more than one-half of the boys contained in the first classes of those schools.

73. The first classes are composed mainly of the children of small tradesmen and farmers, artizans, and persons somewhat raised above the position of purely agricultural labourers. These persons are really anxious to have their children well educated. They select schools where they can obtain what they want, and keep their children at these schools until they have made satisfactory progress; but I am inclined to think that the age at which the sons of agricultural labourers leave school is much the same, whatever may be the quality of the education given. I made particular inquiries in order to ascertain the effect of the establishment of a good school on the supply of agricultural labour. There can be no doubt that many boys who have received a good education abandon agricultural employment in consequence. This must be so as long as education is the exception and ignorance the rule. But I have never found that the supply of labour has been so far diminished from this cause as to create a rise in wages.

But not the sons of agricultural labourers.

74. It is the opinion of some gentlemen that the education given in our parish schools is bad in kind, and that it ought to be of a more practical character, but so long as the attendance at school is limited to the time to which it now extends it seems to me hopeless to attempt to teach more than reading, writing, and cyphering, which all admit must form the foundation of all education.

Some think that the education given is bad in kind.

75. The school fee charged is generally 1*d.* or 2*d.* a week. This the parents can generally well afford to pay. In some cases as much as 3*d.* a week has been charged with satisfactory results. In fact, the evidence upon this point goes to show that the poor do not value what they pay nothing for, and at the attendance improves by the imposition of a fee, where no fee has been previously charged, and y the increase in the amount of the school fee where the fee had previously been very small (B. 9).

Fees not too high.

76. There can be no question that the indisposition of the parents to forego the weekly sum that may be added to the earnings of the family by the child's labour forms everywhere a serious obstacle to education; in the great majority of instances the child is taken away from school as soon as he can earn anything, no matter how small the sum, without reference to the amount of education he has obtained, and, unfortunately, it but too often happens that employment can be obtained for boys at so early an age that their satisfactory education is impossible.

But parents unwilling to forego children's earnings.

77. In connexion with this branch of the subject should be noticed the work which children do for their own parents in their own gardens. In the spring and autumn many are engaged in planting and gathering potatoes; where the amount of land occupied by the parent is increased beyond the dimensions of a small cottage garden, it has been observed that the attendance of the children at school becomes proportionately less regular (A. 89). This fact appears to be at variance with the impression entertained by many gentlemen that the occupation of land has a tendency to raise the moral qualities of the occupier.

Work done by children in parent's garden.

78. In almost every parish will be found some parents who are utterly indifferent† to education, and never

Indifference of labourers;

* This is a mixed school, and the numbers given include boys and girls.

† I have found various plans adopted in order to improve the regularity of the attendance of children at school. At Albury, in Surrey, the attention of the parents is drawn to this matter by a report in the following form, which is sent to them quarterly:—

——	G.	M.	B.	——	G.	M.	B.
Religious knowledge - - -				Dictation - - - -			
Reading - - - -				Spelling - - - -			
Writing - - - -				General conduct - - -			
Arithmetic - - - -				Attendance - - - -			

G. Good. M. Moderate. B. Bad.

The school has been open ____ days.
Your child has attended ____ days.
Has lost ____ days.

I. send their children to school at all, but the number of these is becoming fewer every day. The parents, however, are, as a general rule, uneducated themselves; they manage their children very badly, and do not appear to be aware that continued attendance for a considerable number of years is absolutely indispensable in order that their children may obtain even a very limited amount of instruction. They seem to think that satisfactory results can be obtained if a child goes to school when he has nothing else to do, and that he can, without loss, absent himself as often and for as long as he pleases.

I have met with a case of a woman who would not send her children to a free school because regular attendance was enforced there, but preferred sending them to another school where she had to pay 3*d.* a week for each of them, so that she might be able to take them from school and send them to work whenever she pleased. The husband of this woman was a carter earning high wages (D. 42).

of farmers; 79. I fear there are but few of the farmers who take a real interest in education. There are some, but not many, who think that a man is a better labourer if he has been educated than if he has not. The great majority, if not all, while not denying that a power of reading, writing, and cyphering should be possessed by every individual for his own sake, will not admit that any advantage thereby accrues to the employer. The number of farmers who take an earnest and sincere interest in education, and who are likely to make an effort to improve it, is unquestionably very small. I may add that, as a general rule, farmers are not at all aware of what the real state of education among the children of labourers is. If there is a school in the village, they often jump to the conclusion that all receive a satisfactory education. If they see maps in a schoolroom, they think that all learn geography; and they are too apt to judge of the proficiency of the school* by the first class, in which, in fact, but few labourers' children will be found.

of landowners. 80. Landowners almost always support education in theory, and some of them contribute most handsomely to the support of schools; others deal with schools as they not unfrequently deal with cottages; in the parish in which the landlord is resident the schools will be well supported, but in other parishes where he has property, but which he does not often see, the schools will frequently receive less attention (A. 82, Wilkinson).

81. The result of the above observations is that, as I said in my Report on Northamptonshire, the two main obstacles to education are the indifference of the parents and their indisposition to dispense with their children's earnings. The other causes alluded to are far less important. The fault to be

---

You are earnestly requested to send your child *regularly* while you continue him at the school.

Irregular attendance is unfair to yourself, for it wastes your school money; it is unfair to the teacher, for it wastes her care and trouble; it is unfair to the child, for she will find that during her absence much that she has learnt has been forgotten, and has to be learnt over again.

(Signed)

Manager.

'At Bramley, with a view to a more regular attendance, the two following rules are enforced :—

1. For children who have not attended at least 30 days in any given quarter (with the exception of those for whom the highest fee is paid), an additional payment of 1*d.* per week will be required for the next quarter.

2. The names of children who are absent for more than four weeks together will be struck off the books, and they will only be re-admitted on payment of a fine of 6*d.*, in addition to the extra payment as above.

* Extract from a paper by the Rev. J. P. Norris, upon the Education Bill brought forward by Sir C. B. Adderley in 1860 (reprinted from the Transactions of the National Association for the Promotion of Social Science, 1860) :—

" We hear much of the rapid progress of education, and in one way it is true. Schools are being multiplied, teachers are being trained, large sums are being spent.

" We, *inspectors*, examine these schools, and in each school we find a first class of fairly good scholars, and we report accordingly; and people suppose that all the children before they leave school will receive the education of this first class. But what are the facts ? I speak advisedly, and after careful inquiry, when I say that, even in places where good schools exist, not one in six of the children reach this first class. Ask the teacher of any of our annual grant schools, and he will tell you that one-third of the children of the place still prefer to go to dames' school, and of those that are entered on his books not more than one in four reach the first class. Thus it is that the work done is by no means commensurate with the means employed. The means are excellent, but they only reach one-sixth part of the population. Nor do I perceive much prospect of improvement in this respect. During the 11 years that I have been an inspector I have seen a rapid increase in the number of good schools; but in the proportion of the population that have been willing to avail themselves fully of the education so offered I have seen little or no advance. My belief is that even if every parish in England had its good school not more than one-sixth, or, at the very most, one-fourth part of the population would care to get more than their present smattering of education; and at present not more than one child in six learns to read with sufficient ease to retain or care to use the faculty in after-life."

The following table was supplied to me by the schoolmaster at Christian Malford, in Wiltshire, where there is a particularly good school. It shows the number of children who had been presented in the various standards during the four years preceding 1868. It will be seen from this that the bulk of the children never reach the upper standards; and I was told by the schoolmaster that those who did were chiefly farmers' and tradesmen's children :—

——	1864–65.	1865–66.	1866–67.	1867–68.
I. - -	26	21	25	14
II. - -	22	28	23	25
III. - -	10	22	29	15
IV. - -	18	10	15	14
V. - -	4	11	9	10
VI. - -	—	—	7	7
Infants - -	26	25	16	23
Total -	106	117	124	108

Some light may also be thrown upon this subject by examining the state of education among militiamen.

I examined the roll book of the 2nd Royal Surrey Militia, and ascertained that between the years 1856 and 1867 (inclusive) 2,425 recruits had been enlisted, and of these 1,155, or 47·74 per cent., had signed their names by mark.

In the Wilts Militia, between the years 1863 and 1867 inclusive, 1,170 recruits had been enlisted, of whom 609, or 52·05 per cent., had signed by mark.

The recruits in these two regiments were taken chiefly from among the agricultural labourers, and varied between 17 and 25 years of age. In the other counties I visited they were enlisted mainly from the towns, I therefore thought it unnecessary to obtain any information with respect to them.

I am aware that many men who decline to sign their names are often found to be able to do so when pressed; but I think it may fairly be observed that the power of writing must be of but little value to men who find so much difficulty in writing even their names that they prefer to get somebody else to do it for them.

remedied is not that the children do not go to school at all, but that they attend either too irregularly or leave at too early an age. I.

82. Having pointed out what are the main causes of the present defective state of education, I will now consider how those defects can best be remedied. Remedies.

Although a defect which applies only to certain districts I will first refer to the want of school accommodation.

83. The Rev. W. Gover points out that it is imperative that greater encouragement should be given by the State for the voluntary erection of schools. Formerly, before the introduction of the Revised Code, Government gave one-third of the cost, whilst under the Revised Code they have reduced their aid to one-fifth of the cost of erection, throwing four-fifths upon voluntary efforts. He further points out that "whereas before 1863 the annual increase of school accommodation was not only supplying "the increase of population of school age, but overtaking past neglect at the rate of 10,000 children per "annum, the effect of this unpolitic parsimony has been so to check school building that the annual "increase of school accommodation is falling behind the annual increase of the population of school "age by considerably more than 10,000 per annum." To remedy this defect he recommends "that "powers should be taken whereby, after reasonable time and notice given, adequate schools should "be built in neglected districts, the whole cost of the erection to be defrayed from local rates; such "schools when built should be under a county or union board; and so far as fees and Government "grants did not suffice should be supported in like manner from the rates, unless some approved "voluntary agency undertook to maintain them" (B. 28). The building schools should be encouraged.

84. I feel sure that any attempt to cast the general expense of the support of education on the occupiers of land alone would meet with most strenuous opposition. It is urged on behalf of the occupiers of land that the rates have been greatly increased of late years, that education is a national object, and that the cost of it should be defrayed by the owners of all property, whether real or personal. At the same time I think that the imposition of a rate for the limited object for which Mr. Gover recommends it, viz., for the supply of school accommodation in districts where that accommodation is at present proved to be inadequate, would find many supporters. Opinions as rates.

85. An important question here arises as to the most convenient position for schools. Hitherto the supply of schools has been parochial, and the children belonging to one parish are often prohibited from attending the school belonging to another parish, though such school may be more conveniently situated for them than the school in their own parish, to which they would otherwise have to go. The object of such a restriction is to secure a good attendance of children in *every* parish school. But even if every parish is supplied with a school, in many parishes where the area is large, the population extensive, and the roads bad, one school is quite insufficient. In other places, where the population of two or three villages is concentrated in a small space, as is the case in the valleys of the chalk districts of Wiltshire, a good school in a central position might well supply the requirements of the population of two or three parishes, and a superior education might thus be given at a less cost than would be necessary for the supply of separate school accommodation for each parish. Where schools should be placed.

86. The proper system on which the position of schools should be regulated is that suggested by the Rev. W. Lea (B. 52). His plan is "to have dame schools for infants in each parish, then to send the "elder children to a central school, where there should be a certificated master, at the age of 7 or 8. "It is no hardship for a child of that age to walk two or three miles to school." The school at Cutnall Green, in Worcestershire, mentioned by Mr. Lea, which receives children from four country parishes containing a population of 1,084, is an instance of what might be done in this way. The successful adoption of this plan would necessitate the abandonment by the clergy in many cases of their individual action, but I feel no doubt that the zeal of the clergy, which has already done so much for education, would prevent any difficulties arising on this ground.

87. It has often occurred to me that some greater use might be made of itinerant masters than is now the case. Possibly one such master living in the central village might visit by turns schools in the outlying districts of the parish, or might on certain evenings of the week take classes in distant parts of the parish, and the hours of work in the central school might be diminished on those evenings to enable him to do so; but I have not matured any plan for the purpose of carrying out this idea, and I only make the suggestion in order that others may take it up if it is thought of any value. Itinerant masters.

88. The next point is as to the supply of teachers. There can be no question as to the great superiority of certificated over uncertificated teachers, but very few certificated teachers go to country schools. Supply of teachers.

The Rev. Mr. Gover, giving the result of his experience as principal of the training college at Saltley, says (B. 28), "After sending out my masters for 16 years, I can scarcely look round on any "of them engaged in schools with an attendance below 50, unless where the salary is provided by an "exceptional liberality on the part of the patron." Very few certificated teachers in country schools.

89. Complaints have been made to me by clergymen in rural parishes of the impossibility of complying with the requirements of the Revised Code in order to secure certificated teachers. The result of this is that in the poorest country parishes, where but a few trifling local subscriptions can be obtained, the employment of certificated teachers is impossible. This would be remedied to some extent by the establishment of good central schools, as suggested above. But in order to increase the supply of teachers for country schools, Mr. Gover (after pointing out that a distinct standard should exist for the teachers in a remote village from that for the master for town schools) suggests that "for any "school with an area below 800 square feet (class-room included), let it be open to appoint a "registered teacher. This should be either an ex-pupil-teacher, or any person above 21 years of age, "proposed by the managers, who should pass in some paper of the pupil-teacher's examination, not "lower than that of the third year, at the district examination, under the local inspector. He should "also teach a class or conduct a school in the presence of the inspector or his assistant. And re-"examination in this or the paper of a later year should be required on every subsequent change of "school. Having passed the paper of the fifth grade, registered teachers should be allowed to rise to "the rank of certificated by examination or good service. Their schools might be visited by the "inspector's assistant." Remedy suggested, registered teachers.

I.

Low fees should not be charged.

90. I think that it is a great mistake to charge very low school fees; I do not believe it secures larger attendance than a higher fee does. Education is now generally considered a necessity for the labourers, though possibly they may not think so themselves. Their wages, therefore, should amount to such a sum as would enable them to purchase what is necessary for them, and I believe that the imposition of low fees has a tendency to keep down wages. I think that as high fees should be charged as can be exacted without diminishing the number in attendance at the school. This would make labourers more independent, and benevolent persons would almost always be forthcoming to give assistance where high fees pressed hardly on large families.

The above recommendations suggest what is thought necessary for the supply of sufficient school accommodation and teaching power. These recommendations would become far less important than they now are if the attendance of the scholars was more regular, and the co-operation of parents and employers could be secured in the manner I shall hereafter describe. It has been observed that the principal difficulty to be overcome is the difficulty of securing a regular attendance of the scholars. It becomes important, therefore, to consider what can be done in order to promote this end.

Some think present advance in education sufficiently rapid,

91. There can be no question that great progress is at present being made in most parts of the country. The Rev. John Duncan, vicar of Calne, remarks "that a great and rapid revolution appears to me to "have been going on in the English labourer these last few years; it is due to the meeting together "of two things,—the education of the poor in our village schools, which have given to the bulk of the "population the power of reading, and the penny newspaper, which has given to the labourer matter "to read, and interesting matter which he likes to read." Notwithstanding this, Mr. Duncan is in favour of legislative interference for the purpose of improving the actual state of education (A. 91). On the other hand, the Rev. W. M. Sherwood, after describing his experience as a clergyman of 33 years' standing in the parishes of White-Ladies-Acton and Broughton-Hackett in Worcestershire (to which I beg to call particular attention), comes to the conclusion that to check female labour in the fields, to prevent pauperism, to encourage education, to promote cleanliness, honesty, and general good conduct, one must not meddle too much, but must encourage self-respect and pride, and show respect ourselves to the cottagers, and he adds, "I deprecate most earnestly any attempt to force education" (A. 123).

but the main obstacles are not being removed.

92. The only question is, whether the progress at present being made is sufficiently rapid. It is probable that education will not be thoroughly appreciated until we have a generation of educated parents; and I think we may infer from the facts which I have mentioned that many of those now growing up cannot be said to be educated. The defect is mainly due to the irregularity of the attendance, and the early age at which the children leave.* I see no prospect of these evils being remedied by any causes now in operation. It becomes important, then, to consider in what manner more regular and more protracted school attendance can be secured.

Suggestions for securing regular attendance.

93. Some think that school attendance should be made compulsory up to the age of 10 or 11 (E. 104, 80), and that no attendance should be required after that age. This suggestion, however, goes beyond the principle of the Factory Acts, and I presume, therefore, that it is not within the province of this Commission to recommend it. The system of partial attendance at school has been suggested to me in a great variety of forms. Some recommend prohibition from field work up to the age of 9 or 10, and partial attendance at school between 10 and 12 or 13 (B. 28). Some would require a certain number of attendances per month (E. 95), quarter, or year (E. 100), or during the winter months (E. 92, 94), or until certain proficiency is attained (E. 84, 99, 101, 102, 103); some recommend half day (E. 89, 108, 119); others the alternate day (E. 87) system. In order to secure the attendance of idle and vagrant children it is suggested that the Industrial Schools Act should be more stringently enforced.

Various forms of part time.

Night schools.

94. Many persons, particularly farmers, attach great value to night schools. It cannot be doubted that they are very useful, and deserve to be encouraged, for the purpose of enabling lads who have received a satisfactory rudimentary education to improve themselves, but the evidence all goes to show that, except in cases of peculiar intelligence or peculiar industry on the part of both teachers and pupils (B. 19) night schools do but little more than prevent boys from forgetting what they have learnt when at the day school (B. 38, 56). This is stated by the Rev. Prebendary Morrice to be the result in his own night school at Longbridge Deverill, where every effort is made to secure success for the night school (B. 42). The great difficulties to be met with in carrying on night schools are want of teaching power, the scattered distribution of the population, and the irregularity of the hours of work. The law can remedy the first defect, but certainly cannot remedy the second, and probably not the third. Night schools, too, are attended by two distinct classes; first, those who have received a good elementary education, and desire to improve themselves; secondly, those whose education has been neglected. These two classes cannot be taught together.

No system of partial attendance likely to be successful.

95. In the last Report which I had the honour of presenting to you I expressed an opinion that neither the half-day or alternate day system could be applied with advantage to children employed in agriculture. My subsequent experience has convinced me that the opinion I then expressed was correct. I think it is unnecessary to attempt to explain at length why these systems would fail, because I do not recollect ever meeting anybody well acquainted with the management of a farm who thought it possible that either of them could be successfully carried out. I have never myself seen any attempt to enforce either of them in an agricultural parish, and the only gentleman whom I have ever met who has attempted to carry them out had given up the attempt as being impracticable (E. 79). The suggestion that school attendance during winter should be made compulsory up to a certain age has many supporters; but many farmers require boys to work for them just as much in winter as in summer. I do not myself think that any system of partial attendance at school could be enforced compulsorily upon

* So far from their being any tendency to rise in the age at which children leave school, I have been occasionally told by reliable witnesses that the age is falling. Thus Mr. R. Clutton writes to me, "I am confirmed in the opinion that the increase in the wages "of both men and boys has, instead of inducing a longer attendance at school, produced exactly the contrary effect" (A. 40). Mr. Flower, schoolmaster at Amesbury, Wilts, after an experience of 16 years, says, the age at which boys leave the day-school has fallen (B. 32.)

I.
Half-time requires inspection, which is impossible in agriculture.

those engaged in agriculture. Every such system must be enforced by systematic inspection. In factories the duties of the inspector are comparatively easy, because the children employed are collected in a comparatively small space; but how would it be possible for an inspector to ascertain from a visit to a farm in Wiltshire which extends for four or five miles across the downs what number of boys were employed upon it, and whether each of them had attended the requisite number of hours during the previous week, month, or quarter?*

If enforced, farmers would not employ boys to whom it applied.

96. But beyond this I think that even if such a plan could be enforced in agricultural districts it would be useless for educational purposes. The success of the Factory Act as an educational measure depends upon there being an active demand for the labour of children. As long as they are *employed* in the factory the law gives power to enforce their attendance at school; but in many instances it has been found that sooner than submit to the inconvenience of being prevented from employing children during their whole time, manufacturers have given up employing them at all until they have passed the age to which the Act applies. I should expect that a similar result would follow if an attempt were made to apply any similar Act to agricultural labour. I am confirmed in this view because many of the most experienced farmers whom I have met have expressed the opinion to me that the labour of young boys was most expensive labour. They appear to be very little employed in the north of England and Scotland; and if the law imposed any obstacle to their employment they would probably cease to be employed in other districts. Such a result might be welcomed on one ground; it would probably lead to the wages of the parent being raised so as to enable him to dispense with the earnings of his children; but at the same time there would be no means of securing the attendance of the children at school; and the indifference to education at present so frequently complained of would remain unopposed.

Only feasible plan would be to make permission to work depend on proficiency of child.

97. The only plan which I think would prove practically useful is that which would make the permission to earn wages dependent upon the proficiency attained by the child at school. This proposal rests upon a sound principle; it makes it for the interest both of the parent and the employer that the child should be educated; the sooner the child attains the requisite proficiency the sooner the income of the family will be increased by the child's earnings, and the sooner the farmer will have a hand to work for him. It will then be directly for the pecuniary interest of the parent that the child should attend school regularly from an early age, in order that he may the sooner earn wages, and it will be directly for the interest of the farmer that the age at which the child commences to work should not be unduly postponed.†

---

* The following extract from a letter signed "R. P., Downton," and addressed to the "Salisbury and Winchester Journal" of October 10th, 1868, sums up very clearly the objections to any extension of the half-time system to the agricultural population.

"Now, as to the Factory Acts, I do not know that there is any need to quote their provisions more particularly than to say, that they have improved the education of the manufacturing districts by enacting either—

"1. That the children employed in factories should attend a certain number of times in the course of the year, or

"2. On alternate days, or

"3. On half days.

"I hardly know which of these plans would be the least inconvenient to all the parties concerned, but I think either of them would be anything but agreeable. Let me try to view them first from the employer's point of view. I could imagine that of these methods the first would be rather the least inconvenient and vexatious to him, because it would, in fact, be (taking the most cheerful view of it) only changing his carter boys, his shepherd boys, and his dairy boys twice a year. I believe that this has been proposed in places where the gang system prevails, as enabling the children to take a little schooling at seasons when their services are least required. It proceeds, therefore, on the assumption, which as far as my knowledge goes would be false in this district, that boy labour is required more at one season than another in the fields. I imagine that there may be a little bird-keeping at one time and pig-keeping at another, and a few odd jobs which vary, but the main portion of boys' labour required on a farm is required equally at all seasons.

"As to the alternate day system, I can well imagine the annoyance it would be to an employer never to know who was working for him and who not, and when anything was wrong done, to be told by John Smith, as he assuredly would be, 'That it was not he, but George Jones that did it,' or if he told George Jones to do anything to-morrow, to hear, 'Please, sir, I shan't be here to-morrow, you must tell John Smith to do that.' The half-day system would, perhaps, be a trifle worse. I pass on, then, to consider how the Factory Acts would affect school managers in agricultural districts, as well as the children, for their interests in the matter are in fact identical. The benefit proposed for the children is better education, and that is likewise the object sought by school managers. On behalf of school managers, then, I venture to protest altogether against trying to improve education in agricultural districts *merely by requiring attendance*, whether partially throughout the year, or alternate days, or half days. I cannot conceive anything more unfair to a teacher than to turn in upon his school a considerable number of fresh boys every few months, who, having been to work, will begin to feel a certain degree of independence, and will not be slow to show it off before the younger children, who, being brought there against their will, and being only obliged to be present in the body, will probably do nothing else, unless they treat the teacher and managers as *participes criminis* of having brought them there, and proceed to annoy them accordingly. This would be bad enough under a master, as by the time he had got them into a little discipline they would be off to work, to return as undisciplined again as before, and so the work would proceed much after the manner of the Danaides, the master would pour in a little instruction one six months, and the children would infallibly get rid of it again the next six months, and be no fuller than before. But bad as this would be under a master, it would be still worse under a mistress, and that is the government of a large proportion of our agricultural schools. A mistress may manage boys pretty well up to 10 years of age, and perhaps longer; if she has had them always they will submit to the discipline to which they have been accustomed, but what is she to do with a parcel of carter boys and shepherd boys turned into her school? I believe this plan has not been found to work well in the factory districts, and I am sure that it would not be more successful in the agricultural. Looking, however, at these three systems from the school manager's point of view, I imagine that the two last would be least objectionable, but still very inconvenient. How they are worked in the manufacturing districts I know not, but one can imagine that in schools wholly devoted to one class of boys, and sometimes for separate factories, that it might be managed without much inconvenience, because the scholars would be changed *en masse*, but this would not be the case in our own districts, and I cannot but think that any such plan would materially interfere with the working of our schools. The boy who kept to his own article of the creed, notwithstanding the boy who usually said the previous one was away, is a very old story, and was thought half a century ago to characterise the height of stupidity, but we shall in the alternate or half-day system have the whole teaching of our school, or the results of it, conformed to this principle. Of course the regular teaching of the schools could not give way to accommodate the alternators, therefore the result would be that each set of boys would be well acquainted with the alternate chapters of St. Matthew's Gospel. One set of boys would know something about Kent, Hampshire, and Devonshire; and the other set would be better acquainted with Sussex, Dorsetshire, and Cornwall. This may seem ridiculous, but it would be really too near the truth to be pleasant. I do not see (and I can speak more confidently upon this subject than I could upon one affecting the employers of labour) how an ordinary school is to be carried on which is subject to the constant inroads of alternate day scholars, unless they were so much in advance of the every-day scholars that all the work could be done by the latter twice over, once with each set of alternating boys, and this would not be the case; on the contrary, the alternating boys would have become inferior rather than otherwise to the younger boys in regular attendance—inferior, in fact, to what they themselves were in most parts of school work."

† In my last report I recommended that, with a view to diminish the obstacle to education caused by the early labour, the employment of children under 10 years of age should be prohibited. But I have since seen that "indifference" forms such a powerful obstacle to education that I am inclined to think that it would be hardly worth while to pass a law dealing with the early labour alone.

I.

Practical mode of enforcing this suggestion. Amount of education to be required.

98. The practical mode in which this idea could be carried out would be by making it penal to employ any child under a certain age, say 14 or 15, unless the child produced a certificate, signed by a competent authority, that he or she had passed the 4th Standard of the Revised Code. I say the 4th Standard, because, as I have stated above, I believe that to be the lowest standard which represents an amount of education sufficient for persons occupying even the position of agricultural labourers. It must not, however, be supposed that this amount of education could be attained at once. As I have before pointed out, many children have never been to school at all. Time must be given to these to obtain instruction before the proposed Act requiring proficiency could be enforced. This difficulty might be overcome by postponing the date on which the Act should come into force to four or five years after it was passed, and possibly a lower standard, the second or third, might be required at an earlier date. It has been urged by many gentlemen that this plan should be accompanied by the prohibition of labour under a certain age, say 9 or 10, on the ground that children under that age are physically unfit to work, and also to prevent them being unduly forced on in their school work. I myself do not think that the minimum limit is necessary. Very few would obtain the certificate younger than 9 years of age. No doubt that is full young for them to go to work, but the success of the proposed plan depends on its simplicity; and I think it would be imprudent to introduce any clause which would diminish its simplicity unless there is some urgent reason for doing so. This prohibition might be subsequently enforced if found necessary.

Should there be a minimum age?

Where and by whom should certificate be granted?

99. The next question is where and by whom should the examination be held at which the certificates should be granted?

In my last Report I mentioned, as a serious obstacle to this scheme, that it would be very difficult to hold examinations sufficiently often. I now, however, think that this difficulty might be overcome; it would be sufficient if the examinations were held twice a year, once in the early spring, so as to admit the spring work, and again late in the summer, so as to admit of autumn work. The examination should be held in central places, so chosen that none of the applicants for certificates should have above three or four miles to walk to them. The places at which confirmations are now held would probably be convenient centres for holding examinations.

The examiners at these examinations should be selected from the best of the certificated teachers, and care should be taken that the examinations in each district should be held by a man who was not connected with that district. Those children who were unable to attend the examinations on the day appointed might be subsequently privately examined, either by means of papers (as is now done in the case of night schools), or by diocesan inspectors, or by certificated schoolmasters, resident in central spots, to whom a small retaining fee might be given to secure their services.

Up to what age certificate should be required?

100. The next question to be considered is, what should be the minimum age at which a child should be permitted to work without having obtained the certificate? This limit is indispensable, in order to allow those who were too stupid to obtain their certificates to escape from school and go to work. It must be an age considerably above that at which a child may be expected to attain the required proficiency, in order to create a motive for industry in school work.

I think 14 would be a proper age to fix, at any rate, in the first instance. The 4th Standard could generally be passed at the age of 10; and the wages which a boy can earn under 14 are, in every part of England that I have visited, of considerable value to his parents; and the sacrifice of the wages which he might earn up to the age of 14 would be the penalty he would have to pay if he failed to obtain the certificate.

101. It has often been urged as an objection to this plan that there are some boys whom it is impossible to teach.

Those mentally deficient should be excepted.

I do not believe that this would be found to be the case with any boys except those who were mentally deficient, and I would permit them to go to work without having obtained their certificates, if they could produce a medical certificate of their incapacity.

On whom penalty should fall.

102. The next question is, on whom the penalty should be imposed if the law were infringed? I think that the farmer should be fined if he employed a child under the prohibited age without the required certificate; the fact that work was done should cast on the farmer the burden of proving that he did not employ the boy; the parents and the child himself should only be punished if they misled the farmer as to the boy's age.

Informers should have half the penalty.

103. I have already stated that official inspection, similar to that now employed in factories, would be, in my opinion, impracticable. In rural districts the only alternative is to look for local information to enforce the law. Informers might be encouraged to give information by being entitled to half the fine imposed. A register should be kept at the school or some other convenient place in each parish of all those to whom certificates had been granted, and the schoolmaster or clergyman in country parishes would probably be acquainted with every child who was at work in contravention of the law.

The zeal of the schoolmaster in this respect might be stimulated by his being entitled to a fee, say, of 10*s.*, for every child who gained his certificate, and the farmers might be compelled to add a list of all the boys they employed under 14 in the returns they made for assessed taxes.

Should law apply to those only who are directly employed by farmers?

104. I have already pointed out that there are many kinds of farm work in which the children employed work not for the farmer, but for some man who takes the contract under the farmer. It becomes an important consideration whether the farmer should be finable for those whom he indirectly as well as for those whom he directly employs. At present I do not think that the work in which the children are indirectly employed by the farmer is sufficiently constant to interfere much with their education, while it gives them some insight into farm operations which is valuable to them; but the introduction of the suggested law might have the effect of materially increasing this kind of work; for instance, a farmer might contract with his bailiff to get his birds frightened off all his crops and his ploughs driven for a year for a certain sum, and in that instance the bailiff and not the farmer would be the employer of the children; if this course were to be adopted, it would be necessary to make the farmer finable for boys whom he indirectly employed; but in the first instance I think it would be sufficient to make him finable for those who he directly employed only.

This plan would encourage early

105. The advantages of the plan are that it would induce parents to send their children regularly from an early age. If they were careless in this respect, the clergyman or schoolmaster would be able to go to them and say, "Unless you send your boy regularly to school now, he will not be able to earn

"wages for you until two years later than if you do send him regularly," and if the boy were kept at home to work for the parents so frequently as to interfere seriously with his education, as is constantly now the case, it might be urged with force that the advantage thus gained would be quite insufficient to compensate for the loss which would be occasioned if the certificate were not obtained. It would at the same time encourage children to work by themselves and not simply to attend school, but to get as much information as they could while there. Another important advantage in the plan here recommended appears to me to be that it is not likely to prove troublesome in those parishes where the schools are at present satisfactorily managed; any system of half-time would require a re-organization of the school hours, but where proficiency only is looked to, the particular mode in which the school work is carried on becomes unimportant, and may be left to local school managers to arrange. I have often heard it stated that any interference by law must have the effect of checking voluntary efforts. I should expect that the plan here suggested would have the effect of stimulating those efforts. The law would supply the volunteers with a far more powerful argument in favour of education than any which they now have at their command. At the same time by making the promotion of education a matter of importance to employers, the proposed scheme would, I trust, relieve the clergy of some portion of the heavy pecuniary burden which now too often falls upon them.

I. and regular attendance.

Would encourage children to work by themselves.

106. On the other hand, it may be urged that if a certain amount of proficiency is required as indispensable it may be thought that nothing beyond this amount, which must be very limited, is desirable, and there will be no inducement to go beyond it, and thus all education will be reduced to one uniform level. But it may be hoped that it would have the effect of raising to this level many of those who never attained to it before, and that of this increased number, as many, if not a great many more than do now, will endeavour to go beyond it. I should hope that in a few years farmers will look upon these certificates as some guarantee for efficiency and respectability on the part of those whom they engage, and will for their own sake decline to engage any boy who cannot produce one.

Objections to this plan; said that it would reduce all to one level.

107. It may be also said that it would be unfair upon children who lived at a distance from a good school. This difficulty might be avoided by suspending the operation of the Act in the case of those children who lived at a considerable distance, say, two miles from a good school, but such a power should be sparingly used, because one of the great merits of the plan is that it would encourage the erection of schools where they do not at present exist, and the supply of sufficient teaching power where it is now deficient, in order that adequate progress might be made.

Would be unfair to those who lived at a distance from a school.

108. I think that the operations of harvest and hop-picking should be exempted from the general prohibition to work without certificates, because it has always been the custom for all to turn out for these operations, and children of all ages are useful to their parents and their employers, and because also a certain amount of out of door employment is highly desirable on physical grounds.*

Harvest and hop-picking should be excepted.

109. The plan here suggested has certainly more supporters among those who have studied the question of education than any other plan which I have heard mentioned. Still there are some gentlemen who think it quite impracticable. Among others, the Right Hon. T. H. Sotheron Estcourt has stated this to be his opinion. He says that the only penalty for ignorance must remain what it has always been, a lower class of labour and wages (A. 84). Of course this penalty cannot be applied to agricultural labour, which is already the lowest class of all.

This scheme is generally supported, but has some opponents.

It is important to consider whether this plan would diminish seriously the incomes of the families or the number of labourers at work.

110. According to the report of the Committee of Council on Education for the year 1867–8, the number of children who passed the 4th Standard of the Revised Code in the day schools in Great Britain was 95,960, of whom 22,389 were under the age of 10 years, and 73,571 were over that age; in 1868–9 the total number was 100,386, of whom 24,839 were under and 75,547 were over 10 years of age. There is at present no motive to get the children to pass the standards at an early age. In fact, it is for the interest of the school managers to retard rather than to accelerate their progress. If at their first examination they are presented in a standard which is easily within their capacity, the chances are that they will not fail to pass the higher standards, and thus gain the Government grant in each succeeding year; this they would probably fail to do if they had to exert their utmost powers in the first year. If the plan suggested above is introduced a motive for industry will be supplied, and the age at which the 4th Standard is passed will be proportionately diminished. Farmers almost always say that they do not want boys under 10 years of age. The great majority of children would be able

Would not cause serious inconvenience to either farmers,

* The following extract from another letter signed "R. P.," of Downton, and addressed to the editor of the "Salisbury and Winchester Journal" of October 17, 1868, explains very clearly the probable advantages of the plan here suggested:—

"Most persons, I think, who are well acquainted with agricultural districts, would ascribe in no small proportion to the fault of the parents the want of education amongst their children. Sometimes of course it is their misfortune, shoes will wear out and cannot be replaced, or the child is kept at home to earn something towards replacing them, but how often are they kept at home, or sent very irregularly, which is not much better, from sheer carelessness and indifference? How often have I been told, 'I wanted him to go an errand,' and thus a day's schooling is lost for the sake of half an hour, which might very often be obtained before or after school, even if no one else could do the errand, and what is still worse, the child learns to attach as little importance to education as the conduct of the parents shows that they do, and when at school he becomes accordingly idle. The irregular attendants at school are almost invariably the most idle when there. All this would be completely changed by the parents and children alike knowing that the school was to be attended for a definite object, and then if the education was not thought worth trying for, the certificate would be. It might very likely soon come to be regarded even as a prize and an honour, and a boy would not like to have it said of him that he could not gain a certificate at 12 years old which most could gain at 10. Besides this, the balance between managers on the one hand and parents and children on the other, which has been grievously disturbed by the late measures of the Committee of Council, would be again restored. At present the managers are really made dependent upon the parents and children. If the former keep their children at home, if the latter do not choose to come, or do not choose to learn, the managers are fined; if any offence is taken, or sometimes from mere wilfulness or carelessness a child is not present on the day of examination, the managers bear the penalty.

"All this would be changed, instead of having to be constantly begging parents to send children, and to send them regularly, the managers would only have to provide for their being taught, and the children would know that at all events some of the inconveniences of their idleness would fall upon themselves. I believe a healthy boy of 10 or 11 would sooner go to work than go to school, and a boy therefore would soon be capable of understanding and feeling the force of the argument,—if you do not take more pains you will not get your certificate. I do not like to trespass further upon your columns, but the fact really is, that some such provisions as have been suggested would prove the greatest possible blessing, not only to the agricultural labouring classes, but to all who are in any way connected with them, and not least to the managers of schools, who are now anything but comfortably situated."

The merits of this particular plan are very ably pointed out by the Rev. J. P. Norris in 'The Education of the People,' published by Thomas Laurie, Edinburgh. *See* too on this subject B. 14, 24, 28, 52, E. 112.

I. or parents.

to go to work at this age. The age at which the wages are of value to the parents must of course correspond with the age at which the boy is useful to the farmer. When in Northamptonshire, I endeavoured to ascertain what proportion of the total earnings of the family was contributed by boys under 10 years of age. The information I received upon this point was so unsatisfactory that I abstained from expressing in my Report any direct opinion upon it myself, and merely confined myself to mentioning some of the estimates with which I had been supplied. Since that time I have not been able to obtain any more satisfactory information upon this subject, but I feel convinced that the net gain to the family from this source is very trifling. Where the family happens to be composed mainly of girls, who earn nothing when very young, the whole family has to be supported by the parents, and yet I have not observed that families composed of boys are better off than those composed of girls. In the event of a restriction being imposed the consequent loss to the families would be diminished, as pointed out by the Rev. J. Duncan, by the following causes:—

(1.) Labour would be scarcer by the withdrawal of the younger lads, and therefore the wages of both the parents and elder brothers would rise.

(2.) Labour would be scarcer owing to emigration of young lads to better parts of the country, which would ensue on better education. This cause would cease to have any effect if education became general.

(3.) Labour would, perhaps, be more valuable, inasmuch as it would be in a higher measure skilled labour (A. 91).

Grant should be higher for the upper than for the lower standards.

111. It is highly desirable that as long as the period devoted to school is as short as it is at present; some inducement should be held out to school managers to get the scholars on as fast as possible. A motive might easily be supplied by diminishing the grant now paid for the scholars who pass in the lower standards, and spend the money thus saved in increasing the grant for the higher standards.

Of course it is impossible that any restriction can be imposed by law upon any class of labour without causing some inconvenience to these to whom it applies; but I think that the plan suggested above will do more good and cause less inconvenience than any other which has been proposed.

112. I found scarcely any industrial schools existing in the counties assigned to me; but I will here state the result of my inquiries upon this point.

Industrial school, Ockham.

I visited an industrial school at Ockham, in Surrey, which is conducted under the superintendence of the Misses Lushington. An account of it will be found in the evidence (B. 15). The scholars belong to a class rather above that of agricultural labourers, and therefore I think it unnecessary to insert an account of the school here.

Gardens at Godstone, Bowood, and Hagley.

113. I have met with very few parish schools where any effort is made to give any industrial training to the scholars. The schools where this has been attempted have always been under the control of some zealous parson or squire who can do what he likes. At Godstone (B. 13), at Bowood, in Wiltshire (B. 35), and at Hagley, in Worcestershire (B. 56), I found small gardens attached to the school which the older boys were permitted to cultivate, generally as a reward for good conduct; at Godstone they are obliged to keep a debtor and creditor account of their income and expenditure connected with the gardens.

Carpenter's shop.

114. At the schools at Bowood and Hagley a carpenter attends on certain afternoons in the week to give lessons. I have not met with any instance of an attempt being made to give girls any industrial instruction, except in needlework. In many cases a woman is hired to keep the school clean, instead of the girls being employed for that purpose. This seems to me to be a mistake. The girls would probably take more pride in the condition of the school if they were themselves responsible for it; and an opportunity is thus lost of giving the girls instruction in what is a very important operation.

115. No doubt it would be highly desirable, if practicable, to give a certain amount of industrial instruction in parish schools. Some knowledge of the principles of the lever, screw, &c. would be very useful to boys, and the girls might advantageously be taught to cook and bake; but it seems to me to be hopeless to attempt to give systematic industrial instruction in parish schools. The managers would require more time and money than they can usually command in order to give effect to such a scheme.

Training schools at Savernake,

116. At Savernake, in Wiltshire, there is a training school for female domestic servants which was established by the Marchioness of Ailesbury in 1852. Girls are admitted to it from all parts at from 14 to 16 years of age if they can read and write and bear a good character. They generally remain in the school for two years, and pay 1*l.* per annum if they belong to Lord Ailesbury's estate, and 8*l.* per annum if they do not. No girl ever leaves until a suitable place has been found for her; they can generally get places worth about 9*l.* a year when they first go out. Twenty is the full number in the establishment, of whom two are employed in the kitchen, one in the dairy, one parlour maid, three housemaids, and ten in the laundry. Washing is taken in and conducted under a trained laundress. The girls' clothes are provided by their parents or guardians on their admission; but a stock of underclothing is made and kept at the school and sold to them at one-third the cost price; and they are provided with a good outfit on leaving.

and Calne.

Another institution, very similar to the above but on a rather smaller scale, has been established at Calne, and is now under the superintendence of Lady Lansdowne (B. 36).

117. There can be no doubt that these institutions are very valuable; but the girls trained there are highly trained as servants, and they are accustomed to certain indulgences and a more comfortable mode of living than they are likely to meet with anywhere, except in first-class places. For these reasons they are apt to be dissatisfied with places in small households, and are sometimes not so much appreciated as they deserve.

Pauper children should be boarded out.

118. It was pointed out to me that the present system of bringing up children in workhouses does not furnish them with such a training as is necessary for their future welfare, because in a workhouse they have no experience of real life. To remedy this defect the plan of placing them out to board in the cottages of respectable labourers has been adopted with success in the unions of Leominster, in Herefordshire (B. 4), and of Swindon, in Wiltshire (B. 44). The system has been in operation for many years at Leominster; it was introduced at Swindon in 1862. At both places the results appear to have been satisfactory. The system is very generally known, and it therefore seems unnecessary to describe it in detail.*

* The plan here recommended is described in detail in a small book called "Children of the State," by Florence Hill, published by Macmillan and Co.

The system appears to have been in operation for many years in Scotland. I have before me a paper written in 1864 by Mr. G

I.

119. In connexion with the education of paupers it may be remarked that there are two Acts which are at present permissive which should be made imperative. One (7 & 8 Vict. c. 101.) is the Act for the establishment of district schools for pauper children and the other is Denison's Act (18 & 19 Vict. c. 34.) for the schooling of the children of those who are in receipt of out-door relief. This should be made a condition *sine quâ non* of the relief (B. 14).

Two Acts now optional should be made compulsory.

Cottages.

120. It is almost impossible to compress into a limited space a description of the various kinds of cottages which exist in different parts of the country. Most of the descriptions of cottages which I received in answer to the questions contained in the circulars which I distributed are printed in the evidence (E. 129 to 180). I think, however, that the following general classification of cottages will be admitted to be tolerably accurate:—

Three classes of cottages.

(1.) Cottages built by and belonging to landlords.

Those belonging to landowners.

121. The cottages which landlords are at present building in different parts of the country (and they are building a great many) are almost universally good. They are generally built in blocks of two, containing three bedrooms each, and sitting-room, kitchen, and pantry downstairs. The out-houses, &c. attached to these are all that can be wished; they do not often cost less than 150*l.* apiece. Cottages of this description have only been built during the last few years (for an instance see E. 131). Besides these the landlords own a great many cottages which in consequence of the tendency to increase the size of the holdings have been converted from old farmhouses, and are generally sufficiently commodious. Lastly, the landlords own a great many which have been built in former times, when less accommodation was thought necessary than at present, as well as cottages which they have bought up from speculators and squatters and put into decent repair or added to.

Those built by speculators.

122. (2.) Cottages which have been built by speculators are greatly inferior to those which have been built by the landlords. They are of course built *to pay*, and are consequently built much more cheaply than those from which the landlords expect no direct return. They are generally deficient in drainage and out-house accommodation, and have little or no gardens. This class is to be met with chiefly in open parishes and near towns (E. 140).

Those built by labourers.

123. (3.) The third and decidedly the worst class of cottages are those which have been built by the labourers themselves, generally on pieces of land cribbed from the waste. They are generally constructed of wattle and dab and thatched, and contain only one bedroom and one sitting-room. They are generally totally destitute of drainage, and are often, in consequence of the poverty of their owners, in very bad repair. They have, however, one decided advantage over class two, viz., that they generally stand in a garden by themselves, whereas class two are almost always built in blocks. The great bulk of the cottages in Herefordshire belong to this class, where they are scattered over the country and are rarely collected in villages; but many of the same class are to be met with in other counties, more particularly on the commons of Surrey.†

Rent.

124. The rents charged for landlords' cottages, which almost always have gardens, vary between 20*s.* and 6*l.* per annum; these sums are the two extremes, and, as a general rule, they are not let for less than 50*s.* or more than 4*l.* per annum. The rent charged for class two is generally 20 or 30 per cent. higher than that charged by the landlords. It struck me that the cottage rents were generally rather higher in Surrey and lower in Wiltshire than in the other counties I visited. The cottages are generally sufficient in number and conveniently situated with respect to the work to be done; but it is very seldom that there is a sufficient supply of cottages with two or three bedrooms (E. 128), and cases of serious overcrowding may be found if looked for in almost every parish (A. 36, 55, 76, C. 12, E. 175).

Conveniently situated, but not large enough.

Opinion of doctors as to cottages.

125. The medical men to whom I spoke on the subject are, with two exceptions (C. 7, 10), unanimous in condemning the cottage accommodation as totally inadequate to secure the health of the inmates. No doubt the evils arising from this cause would be far more serious than they are if it were not for the large proportion of their time which the labourers pass in the open air. The insufficiency of the present system of drainage in large country villages cannot be better illustrated than from the instance of Carshalton in Surrey. Although that village is blessed with a magnificent natural supply of water from the Wandle which rises there, the water obtained from this source has been poisoned by the escape of sewage from cesspools, and it has been necessary to have recourse to the next parish for a supply of pure water (C. 3).

Better drainage much needed.

126. The necessity of enforcing some more perfect system of drainage than that which is now generally to be found in country villages was constantly pressed upon me; but I think it unnecessary to enter in greater detail upon this subject in consequence of a Royal Commission having been specially appointed to deal with it.

Greig, Clerk to the Edinburgh Parochial Board, in which he states that "18 years ago" the plan was adopted in Edinburgh; that the number sent out by the parishes of Edinburgh and Leith had been upwards of 700; by Glasgow somewhat more; and by Dundee, Aberdeen, and other towns in proportion to their population.

He states that the total cost of each child thus boarded out during the previous year was 8*l.* 13*s.* 10*d.* The allowance of 2*s.* 6*d.* a week to the nurse covered board, lodging, washing, and mending clothes. The clothing was supplied in addition. He states that he finds no difficulty in getting respectable people to receive the children, and adds, "Although we have 300 boarded-out, and some "years ago had 400, I have only had occasion to remove children for neglect on three or four occasions during a period of five "years."

The plan has also been adopted by the guardians of the Eton Union, where it has been attended for some time past with very satisfactory results. In 1868 a report was presented by the school committee to the guardians, from which it appeared that of 32 boys and 24 girls who had been boarded out, only three girls and two boys had turned out badly. The report also compares the expense of maintaining pauper children in the workhouse, where it is stated to be 4*s.* 2½*d.* per week; at Hanwell school where it is stated to be 5*s.* 3¾*d.* per week, and when boarded out, when it has been found at Eton to be 4*s.* 2*d.*; the last named sum is composed of the following items:—Out-relief 3*s.* 6*d.*; clothing, 6*d.*; and education, 2*d.*

† "[At Bromyard, in Herefordshire,] many of the cottages are in the last stage of senility and decay. The windows are broken, the doors are far from wind-tight, or the roofs water-tight, and the bedrooms unceiled. In a block of nine houses, some of which are unfit for habitation, the owner has provided two out-door closets for the tenants and their families, which number 53 persons of both sexes and all ages!"—Extract from a paper read on the 14th April 1868, at the annual meeting of the clergy and laity of the rural deanery of North Frome, Herefordshire, by the Rev. Nash Stephenson, Vicar of Bromyard.

I myself visited the cottages here alluded to, and can testify that their condition is not at all exaggerated by Mr. Stephenson in the passage quoted above.

I. Allotments.

127. I found the allotment system in operation in many instances, but more in the counties of Wilts, Warwick, and Worcester, than in Surrey and Herefordshire (almost all the cottages have gardens in the two latter counties). I dealt with this subject of allotments in some detail in my last Report, I therefore think it unnecessary to enter into it again. I may say generally that my subsequent experience has fully confirmed the opinion on this subject I expressed in my last Reports. There is, however, one point connected with the subject of allotments to which I wish more particularly to allude, and that is the amount of land which should be held by each man. I have found a very general opinion prevailing that a quarter of an acre only should be held by each man. I have met with a few cases where a larger amount is given. Mr. C. G. Bolam, Lord Ailesbury's agent, states in his evidence, that at "Burbage "there are a number of small accommodation holdings of from 2 or 3 to 20 and 30 acres. The "land being very rich and productive, the tenants are enabled to raise good crops at a comparatively "small outlay. They pay an accommodation rent for these lands, and make a livelihood by growing "vegetables, seed, &c., and making milk and butter for the markets. They are, as a body, almost "worse off than many of the labourers; their capital is small; their work very fitful, at times very "hard, at others very slack. The result of these intervals of comparative ease is too often the "formation of vicious habits, and their want of education and training prevents them from profiting "by the start beyond the ordinary farm labourer" (A. 111).

Large amount of land held at Burbage.

Archdeacon Stanton, vicar of Burbage, referring to these men, says, "I don't think that these men "are as well off as many who work regularly as day labourers. If they get an unusually good crop "they become extravagant; they don't save, and suffer from want during the winter when no work is "to be had" (A. 89). Mr. Bolam, however, thinks "it advisable to have a certain number of these "holdings upon an estate, and to select tenants for them only from farm labourers who have reached a "certain age and had some experience of work." He thinks that this plan would be a great incentive to labourers to earn good character, and that these men would be available as a sort of reserve force in time of harvest, turnip hoeing, &c. At Bowood, Lord Lansdowne has 580 acres on his estate let out in allotments to 832 labourers; some men hold as much as two or two and a half acres. Mr. J. Spencer, Lord Lansdowne's agent, says, that he does not consider these holdings too large in that neighbourhood, because the supply of labour is in excess of the demand; many men cannot get employment all the year round, and the large allotments serve to give them employment when they are out of work (A. 92). I have met with a few instances of regular day labourers occupying several acres of grass land with apparently satisfactory results.

And at Bowood.

Cottages let to farmers.

128. In many cases, more particularly in Wiltshire, it is the custom for landlords to let a large number of cottages to their tenants with their farms; in one instance I found 20 let with a farm of 700 acres (A. 102), in another 26 with a farm of 1,870 acres (A. 107). These are sublet by the farmers to their labourers, accompanied in some cases by a stipulation that the labourer's wife shall come out to work whenever the farmer wants her (A. 1). This plan is very much objected to by the labourers themselves (D. 22, 24, 31), on the ground that it binds them hand and foot to their employer; and obliges them to yield to whatever terms he thinks proper to exact from them. The other extreme of letting no cottages at all with the farm is equally unfair towards the farmer. If he has no control at all over his men, they will sometimes leave him at the busiest times, and he will be subjected to great loss in consequence. The plan which is probably fairest to both farmer and labourer, is that recommended by Mr. Bolam. He thinks that cottages for the principal servants, such as shepherd, head carter, groom, and bailiff should be built close to the homestead, and let with the farm. The remainder should be kept in hand by the landlord, but each farmer should be allowed to nominate the tenants to a certain number in addition to those which he takes with his farm.

Only sufficient for the principal servants should be so let.

Terms for which cottages are let.

129. I have found cottages let for every variety of period; by the week, month, quarter, half year, and year. The weekly tenure is decidedly too short; it greatly diminishes the interest the labourer takes in his cottage and garden; unless he has a landlord in whom he feels perfect confidence. The yearly tenure is too long, because it is very difficult for him to save out of weekly wages a sufficient sum to pay a whole year's rent at once. Probably the monthly or quarterly tenure is the best, but under any circumstances the value of the capital which a man has invested in his garden should always be secured to him, in the event of his being suddenly called upon to give up his cottage.

Small Tenements' Rating Act might be extended. Power to borrow money on leases. And to improve old cottages.

130. For the purpose of giving additional encouragement to persons desirous of building cottages, it was suggested to me that the Small Tenements' Rating Act should be extended to all dwellings under 6*l.* annual value, so as to except them from local taxation; that power should be given to borrow money on long leases (as well as on freeholds as at present), for the purpose of improving old cottages as well as erecting new, and that where a number of cottages are built together, the present rule, that no power to borrow should be granted unless every cottage has three bedrooms, should be relaxed.

Cannot be built on self-supporting terms.

131. No mode has been suggested to me by which good cottages can be supplied at such a price that the rent now generally paid by the labourer shall represent a reasonable amount of interest on the capital expended. Philanthropic schemes for this purpose are idle; the cottages can only be improved by the improvement of the labourers themselves. In order that better cottages may be secured, two things must concur. (1) The labourer must desire to occupy a good cottage, and (2) must be able to pay for it. If he really desired it, he could probably soon be able to pay for it; and until he does, he never will. At present there can be no doubt that labourers care very little where they live. It is clear that they do not value the good cottages landlords are now building for them; or it would be unnecessary to make the stringent regulations, which are now indispensable, for the prohibition of lodgers and nuisances. I have been told by land agents that they often have a difficulty in inducing labourers to change their old bad cottages for superior new ones which have been provided for them. I have scarcely ever myself heard labourers complain that their cottages were not good enough for them, although I have often heard them complain that their wages were too low and gardens too small.

Labourers do not value good cottages.

Said that no direct return should be expected from cottages.

132. Many think that cottages should be looked upon as farm buildings, and that no direct return should be expected for the money laid out upon them. I believe that this opinion is founded upon false principles of benevolence, and is quite inconsistent with the real interest of the labourers. If this be the true view of cottage property, we must never expect to see good cottages, except on the estates of wealthy landlords; it is well known that a large portion of the landed property of this country is in the hands of very poor men, who have no ready money to lay out; and for the supply of labour on these properties bad cottages must be continued to be erected, as they now are, by

I.

small speculators, and let at very high rents. If on the other it paid to build good cottages, capitalists might be induced to build good cottages for the supply of labour on the estates of needy landlords. My conclusion is that the only effect of charging low rents is to prevent wages from rising; and that the interests of labourers would be best consulted if higher rents were charged, which would probably lead to higher wages being paid. In the neighbourhood of London this is actually the case. Cottage rents are 3*s.* or 4*s.* a week, but the labourer is not in a worse position on that account, as his wages are 15*s.* or 16*s.* a week. Of course any sudden rise of rents would be embarrassing to the occupiers; but the tendency should be to raise the rents gradually, so as to encourage the building of good cottages. Many farmers are now willing to pay 5 per cent. for the money expended by their landlords in building cottages. I think that this 5 per cent. would do more good if spent in increasing the wages of the labourer, who might then pay a higher rent in return for the benefit he derived from occupying a good cottage. It has often occurred to me that part of the money now laid out in building model cottages, which labourers do not appreciate, would do more good if spent in endeavouring to raise the moral character of the labourer, and teaching him that it was for his interest to occupy a good cottage.

If, so none but wealthy landlords can have good cottages.

It is a mistake to charge low rents.

Money would be better spent in raising character of labourer.

133. I have found a great many friendly societies existing in different parts of the the country, to some of which I think it desirable to call attention.

Friendly societies.

By far the most important institution of this kind which I met with was the Wiltshire Friendly Society, which was established in 1827, under the presidency of the Right Hon. T. H. Sotheron Estcourt, and now carries on operations of a very extensive character. The chief offices are at Devizes, but there are about 100 branch offices in various parishes in Wiltshire, and a very few in other counties. The objects of the society are (1) to give an allowance during sickness up to the age of 65; (2), an allowance during sickness or a weekly pension between that age and death; (3), a sum payable on death; (4), a sum payable to a member, or nominee of a member, when such member or nominee reaches a fixed age. The general management of the society is under a committee, consisting of the president, treasurer, trustees, and honorary auditors, together with one honorary member and two benefit members from each division of the county. A branch office is established in every parish in which 10 benefit and 1 honorary member can be secured; and each branch office is managed by a committee, consisting of three elected benefit members, as well as all the honorary members who subscribe to the funds of that branch. A doctor and a steward are appointed for each branch. The doctor receives 2*s.* 6*d.* per annum for every member belonging to the branch for which he has to supply medicines, and the steward who keeps the accounts of the branch is paid 1*s.* 3*d.* per annum for every member belonging to his branch.

Wiltshire Friendly Society.

There are two classes of assurance members for an allowance in sickness—

(1.) Assurance members whose contributions increase according to their age at the time of admission, and are carried to the account of the society; and (2), deposit members whose contributions at all ages are uniform, and are carried to the account of the members themselves. Each deposit member must contribute each year at least 17 times the amount of days' pay which he is to receive in case of sickness, but (except when actually in receipt of sick pay) he may contribute whatever sum he can afford to lay by. The balance (after deducting the amount necessary to provide a fund for sick pay) belongs to the member, and is returnable after the 65th birthday, or at the death of the member is payable to his legal survivors. A benevolent fund is thus formed.

In 1867 the society contained 6,276 members, whose subscriptions amounted to 4,633*l.* 15*s.* The subscriptions of honorary members amounted to 326*l.* 6*s.* Total receipts, 6,348*l.* 0*s.* 2*d.* The expense fell short of the sum by 1,025*l.* 6*s.* 2*d.*, which was added to the capital, and raised it to 28,752*l.* 5*s.* 5*d.*

134. The North Warwickshire Friendly Society, the chief offices of which are at Coleshill, was founded about 25 years ago by Sir C. Adderley. The rules are substantially similar to those of the North Wilts Friendly Society. There are also clubs called Becher clubs (after the Rev. J. Becher, of Stockwell, Northamptonshire, who founded them) at Stratford-on-Avon, Alcester, and Solihull, in Warwickshire, and at Stewpony, in Worcestershire. These are all of importance in the districts in which they are situated; they are well managed, but there is no particular feature connected with these which requires to be specially noticed. The Herefordshire Friendly Society is the most important in that county. The smaller clubs, though rarely as safe, are often more popular than the larger ones, owing to the management being in local hands.

The North Warwickshire Friendly Society.

Becher clubs.

135. The effect of a registration of a friendly society is often misunderstood. An idea prevails that registration is equivalent to a guarantee of solvency. In order to make friendly societies more secure, it has been suggested that no society should be registered unless it were ascertained that the tables by which the payments were regulated were founded on reliable calculations, and further that every society should be required to obtain from time to time a certificate of solvency from a professional actuary. The prudence of giving effect to these suggestions appears to me to be doubtful; if carried out they would not be equivalent to a guarantee of solvency; but it might be *thought* that they were, and thus a fictitious value given to unsound societies in consequence of the interference of the law. Possibly the better plan is to encourage people to take care of themselves by interfering as little as possible with them. Nobody can doubt the importance of encouraging the labouring class to belong to these clubs. In fact, one gentleman, the Rev. W. Poole, has gone so far as to recommend that it should be made compulsory on all young men over 15 to belong to one, and would make it incompetent for them to give evidence or receive parish relief unless they did (A. 11). This suggestion is obviously of too arbitrary a character to entitle it to general support.

The effect of registration often misunderstood.

Proposals for improving friendly societies.

136. I have myself often felt surprise that friendly societies find as many subscribers as they do, when it is recollected that the ratepayers are bound by the poor law to make the provision for the sick and aged free of all expense to the person benefitted, whereas, what is received from the club must be paid for. To obtain this provision from a benefit society requires prudence and self-denial, which are discouraged by the poor law; in fact, there can be no doubt but that the poor law has a direct tendency to weaken those feelings of self-reliance and independence among the labouring class, on the development of which qualities the amelioration of that class must necessarily depend (see observations of Rev. J. Wilkinson, E. 188).

The poor law diminishes the inducement to belong to clubs.

137. I found that statute fairs or mops were held in all the principal towns in Warwickshire, Worcestershire, and Herefordshire, as well in the north of Wiltshire; but none are held in Surrey. They were

Mops.

I. Fewer servants are hired there than formerly.

no doubt originally used solely for the purpose of enabling servants to be hired; but they are now mainly kept up as places of amusement for farm servants. Not nearly as many servants are engaged at them now as formerly, owing, in a great measure, to fewer servants being hired by the year, and also to the advance of education, which enables places to be obtained by correspondence. But still there are many persons, such as showmen, publicans, and shopkeepers, who are interested in keeping up the fairs, and who do all they can to make them attractive (A. 60, 62, 68). No doubt a good deal of immorality prevails at these fairs;* a year's earnings are often lost (A. 51); and to the farmers themselves they are inconvenient, by depriving them for some days of their staff of servants. At the same time it does not appear that a serious number of police cases arise out of the fairs (A. 59), although they may be troublesome to the quiet people who live in the towns where they are held.

Registration offices have failed.

Registration offices do not appear to have answered; scarcely any but domestic servants are hired there; and as they offer no substitute for the amusement of the fair it cannot be expected that they can prevent people from frequenting the fair.†

Proposal for improving mops.

The Rev. A. H. W. Ingram thinks that mops have a tendency to keep up wages by bringing a number of servants together from different parts, and enabling them to ascertain what wages are being generally paid. They should, however, he thinks, be shorn of their present immoral influences. Two large rooms should be opened in the town where they are held; one for the convenience of the female servants and their female friends and employers, and the other for the male labourers and the masters seeking to hire them. The mop, where the sexes were separated and the young servants removed from the immoral spectacles and from hearing the ribald ballads howled in the streets, would become for the day a large and well-conducted registration office, opened just at the time most suitable for agricultural hirings (E. 198). It would, however, be a very arbitrary proceeding to attempt to put a stop to mops by law; it is very questionable whether the evils which they cause are so serious as to warrant such a step; but these evils might, no doubt, be greatly mitigated by the adoption of some of the means here suggested.

Public-houses.

138. Drunkenness was everywhere pointed out to me as the main cause of demoralization among the agricultural labouring class, and I fear that this charge is not without foundation. The question of beer-houses is now being taken up by Parliament. I met with a very general opinion that excise licences should be put a stop to; but in addition to deciding to whom and on what conditions licences to sell beer should be granted it seems to me most important to endeavour to put a stop to the adulteration of beer. A man who asks for a quart of ale at a public house is clearly entitled to have what he asks for, whereas now he too often can only obtain a thick and heavy beverage which stimulates instead of allaying the thirst. Whether or not it is possible to make men sober by Act of Parliament is a doubtful question, but if an attempt is made to do so the new Act should undoubtedly deal with the article sold as well as with the person selling it.

Conclusion.

139. I have now stated, I hope clearly and in sufficient detail, the results of the inquiries I have made in the district assigned to me; and I will now sum up briefly the conclusions to which these inquiries lead.

(1.) It does not appear that either women, young persons, or children are engaged, either occasionally or continuously, in any parts of the district I have visited in any kind of agricultural employment which is the cause of serious physical injury to them. No legislation is therefore necessary to protect them from physical injury.

---

* Extract from the report of a meeting of the Swindon Chamber of Agriculture, held on March 30, 1867, when the subject of "Hiring Fairs" was discussed. The following is a portion of the address delivered by the Rev. H. G. Baily, who introduced the subject:—I have taken some pains to ascertain the opinions of those best qualified to form a truthful estimate, I mean the county police, and I can safely say from documents now in my possession (from Durham, Yorkshire, Worcestershire, Berkshire, and Gloucestershire, besides our own officers) there is but one, and that a most decided testimony against the prevailing profligacy and immorality which prevail on these occasions. One superintendent writes thus: "What is the practice? As soon as the hiring is over the "dancing booths and public houses are besieged, every species of revelry (and often of the most indecent nature) is indulged in "men and women get excited with drink. I have often found women helplessly drunk, and have found them a place of safety "and shelter until they have been in a fit state to proceed to their homes." An inspector writes: "Hiring fairs are in my opinion "very demoralising. To say nothing of what takes place during the time of hiring, almost immediately after the bargain is made "the young man and woman adjourn to the public house to drink, dance, and sing, and frequently I have seen young girls led "away intoxicated. The girls lose the moral power over themselves, and young men's passions are inflamed by drink, and the "natural consequences follow; hence many a young woman dates her ruin from the hiring fair." Hear the testimony of a highly respected and valued superintendent: "With reference to the statute fairs and mops held annually, I have no hesitation in saying "that the debauchery, drunkenness, and vice which occur at these times, in a great measure tend to demoralize the labouring "class, both men and women. My experience has taught me that very many young girls who attend these places with the most "innocent intentions, some to sight-see, some seeking situations, are by their ignorance allured into public houses where dancing, "drinking, and drunkenness are going on. As to fornication and adultery, words cannot sufficiently express the extent to which "these are carried on, both by the married and single, who doubtless, up to the very time of leaving home to attend the fair, had "led a virtuous life. This is not all, thieves, garotters, and desperadoes of the very worst type in large towns attend the mops, "and reap in many cases booty by plundering the working classes."

Another superintendent writes: "It causes a great number of thieves, prostitutes, and suspicious characters to come into the town, "with whom the labourers are compelled to mix for want of other accommodation at the public houses. Here it frequently happens "that pockets are picked of what they have worked hard for all the year. Many of the stall-keepers are of questionable character, "and frequently afford cover for stolen property. Boxing and dancing booths are too a great evil. In consequence of the great "influx of loose and suspicious characters the low public houses and low lodging houses are unable to find accommodation for them. "They may be seen the night previous to the fair and the night of the fair sleeping in rooms with many of each sex." Although I have many more testimonies of a like nature, I will only add one more; it is that of a superintendent (in an adjoining county). He says: "So far as my experience goes I am confident that great evil is the result of such fairs, especially amongst young people, both "male and female. I have served 16 years as a police officer, and have always strongly condemned such gatherings, in consequence "of its bringing together the very worst of characters. A great amount of thieving is usually done, great riot and debauchery and "other evils too numerous to mention, and at the same time no advantage is derived by those for whom the statute fairs are "instituted." Now, gentlemen, I could greatly multiply these statements, but I will not weary you further by repetitions of similar opinions which expose the frightful nature and extent of the prevailing evil. I must say, though I was prepared to receive decided expressions of opinion, I was utterly unprepared to be furnished with such astounding revelations as those I have referred you to. I will, however, observe that evil like good has its reflex character. Does not evil of this kind brought into any town increase and strengthen the evil which has existed there previously? Does the young girl who has sacrificed at the hiring fair the most precious jewel of a character hitherto unstained, or the lad who on the same occasion has learnt the first lesson of excess of sensuality, do these, I ask, return from the fair as they came to it? No, they become in turn the corrupters of others, and so the moral plague spreads like a fearful gangrene among the lower orders; all the efforts that the clergyman, the schoolmaster, and the philanthropist can bring to bear are powerless against this gigantic system of profligacy and crime.

† The Herefordshire Registration Society, of which J. H. Arkwright, Esq., of Hampton Court, is the honorary secretary, has been in existence for two years. It has established registry offices at Hereford, Leominster, Ledbury, Bromyard, Ross, Pembridge, and Wigmore. The result of the first exertions of the society has been as satisfactory as could have been expected. The registrations effected have comprised 260 employers and 323 servants. I am unable to say what proportion of the latter were in-door and what out-door servants.

(2.) I do not think that the women who are engaged in agricultural work are necessarily more demoralized or that their homes are necessarily less well cared for than the homes of women who are not so engaged. I think, therefore, that no legislative restriction is necessary on this ground. I.

(3.) The state of education among the young now growing up is very generally defective; this is owing mainly to the irregularity of the attendance at school or the too early withdrawal of the children. I can see no prospect of the influence of these two causes being mitigated within any reasonable time except by legislative interference. If it is thought desirable to pass an Act of Parliament for the purpose of remedying this defect I think that the principle of the new Act should be to make the permission to earn wages depend on the proficiency of the child at school.

I beg to thank you for the kindness which I have always received at your hands,

And have the honour to remain,
Your obedient Servant,

Temple, August 1869. F. H. NORMAN.

[In section 55 of my Report on Northamptonshire I referred to a statement made to me by Mr. Hughes, of Brampton Ash, Market Harborough. I appear to have mistaken that gentleman's meaning, as the following letter, which I received from him as soon as he saw my Report, will explain:—

Brampton Ash, Market Harborough,
14th December 1868.

DEAR MR. NORMAN,

I SEE you misapprehend my meaning in setting the average wages paid to a family on account of work done on the land at 80*l.*

By this I mean that in taking as a standard for cottage accommodation the amount actually paid in wages in the district it becomes necessary to know what could be or what is amassed in the shape of wages for work done by one industrious family provided with such cottage accommodation as would enable them to hold together until they are of an age and independence to set up for themselves.

I have men in my employ who exceed the amount I have named. I give you the particulars of one, as he only occupies the position of day labourer, and is in every respect a fair representative of his class.

In seeking to reform we must level up to these men, and we shall have children educated, rents paid, and lift from their present degradation the most contented, tractable, and loyal class in the kingdom.

I hope if you have an opportunity you will set this right, &c. &c.

Believe me, &c.
ALFD. HUGHES.

PARTICULARS referred to in the above LETTER.

EARNINGS of a Family engaged in ordinary Labour and at ordinary Wages on Mr. Hughes' Farm at Brampton Ash, Northamptonshire.

Head of Family, JOHN LEE, about 48 years of age.

Father's Earnings.

	£	*s.*	*d.*	£	*s.*	*d.*
46 weeks at 12*s.*	27	12	0			
4 weeks, harvest	6	0	0			
2 weeks, hay	1	15	0			
Extra, 10 weeks' piecework	3	0	0			
Extra, 20 days' threshing and chaff-cutting by steam	0	10	0			
				38	17	0

MANNING LEE, eldest son, 19 years.

52 weeks at 10*s.*	26	0	0			
Extra for harvest	4	0	0			
Extra for hay	0	9	0			
Extra for piecework, 10 weeks	1	0	0			
Extra for overtime	0	5	0			
				31	14	0

TOM LEE, second son, aged 16.

52 weeks at 8*s.*	20	16	0			
Extra for harvest	1	0	0			
Extra for hay	0	9	0			
Extra for overtime	0	5	0			
				22	10	0

JOB LEE, third son, 14 years.

52 weeks at 4*s.*				10	8	0
Total Earnings of Family				103	9	0

My waggoner and his two sons, engaged with horses, earn more; shepherd and two sons, ditto; and another ordinary labourer nearly 90*l.*

Therefore I think that if the occupier of a large farm had the selection of the occupants of the cottages, and some arrangement such as I have proposed for the accommodation of bachelors in his village, that one cottage for every 100*l.* paid in wages would be sufficient in this district.

To Her Majesty's Commissioners.

Gentlemen,

J. 1. I have the honour to lay before you the evidence which I have obtained in the counties of Oxford and Berks on the mode of employment and general condition of the agricultural labouring class. Such evidence being especially intended to illustrate how the manner of employment bears upon the question of adopting for the regulation of farm labour rules analogous to those of the Factory Acts, and to what extent the general condition of agricultural labourers and their families make legislative interference desirable or otherwise.

Time of collecting evidence.

2. I entered Oxfordshire on the 13th of October 1868, and quitted Berks on the 19th of the following February, having spent the intervening time, with the exception of three weeks at Christmas, between the two counties in collecting evidence. The agricultural employment, therefore, which came under my personal observation was that which is common to all arable farms throughout the country, whether wholly performed by male or partially, as in these counties by female labour, during that season of the year when the staff of a farm is reduced to its smallest dimensions, when catch workmen can with difficulty make full time at the reduced winter wage, and when many women and children cease either from choice or necessity to add their share to the diminished family purse. It must be remembered also that I am speaking of a winter succeeding a summer which, owing to the great failure of root crops, the very small growth of weeds, and the extraordinarily early and quick harvest, had afforded the labourers an unusually small opportunity of providing by summer piecework against the lower earnings and heavier wants of winter. On the other hand, the winter itself was exceeding mild, female labour was more than commonly in demand, agricultural work was seldom if ever interrupted by the

state of the weather, and the price of bread, though not low, had fallen considerably since I visited the neighbouring counties upon which I have already reported. I had an opportunity, therefore, of seeing female employment in farm labour at that season which is considered least suited for it, and of ascertaining better than after a summer of full work to what extent, if at all, thrift enters into the composition of the labourers of Oxfordshire and Berks. J.

3. The evidence from each county is arranged separately, beginning with a summarry (See Appendix A. in each case) of the answers to questions (exclusive to those which refer to the state of cottages and supply of garden ground,) contained in such of the "Commissioners' circulars of inquiry," as were returned to me in time for insertion in these summaries, and of labour returns from 37 farms in Oxfordshire and 49 in Berks. Arrangement of evidence.

Appendix B. in each case contains a description of the cottage accommodation and supply of garden or allotment ground in the parishes for which circulars of inquiry were returned, or which were visited by me, evidence about schools, especially industrial schools, which could not be inserted in the summaries, evidence on the rate of wages and earnings of agricultural labourers and their families, evidence given by the labouring class themselves, and such other evidence as is more or less peculiar to the parishes from which it was obtained.*

Appendix C. in each case contains evidence applicable to areas larger than parishes, such as resolutions of boards of guardians, evidence given by chairmen of boards of guardians for their respective unions, evidence given by medical and relieving officers of unions, school teachers' evidence, evidence on benefit societies, on the state of pauperism, on yearly hiring, on statute fairs, and evidence on the general objects of the Commission contributed by persons residing in the counties of Oxford and Berks.

Appendix D. contains evidence on subjects of general interest to the Commissioners, as well as some evidence which reached me too late to be inserted in its proper place.

You will observe that I have adopted the same arrangement of evidence as I did for the counties of Bedford and Buckingham. I have done so chiefly to facilitate references for comparison; comparisons are said to be odious, but they are the only lights available for the solution of some of the difficult social questions with which the Commission has to deal.

4. I issued 102 of the Commissioners' circulars of inquiry in Oxfordshire, and the same number in Berks, of which there have been returned to me, up to the time at which I write, 82 from the former county and 86 from the latter; 168 in all; of these 75 have been returned by clergymen for their parishes, 31 by landowners, 54 by occupiers of land (of whom 49 are also guardians of the poor for their respective parishes), and eight by other persons. The answers contained in these circulars, which are given in as concise a form as possible in the different summaries, together with the evidence obtained at meetings of boards of guardians which I attended by appointment in 11 different unions, the evidence given by medical officers, relieving officers, and school teachers, and the evidence I obtained as to the mode of hiring and rate of wages, give a very complete history of the position of the agricultural labouring class in these counties, as well as valuable suggestions on the best manner of counteracting the evils which most commonly beset the labourer and his family, whether arising from drunkenness, improvidence, bad housing, low wages, or ignorance, or from a combination of any or all of these his greatest enemies. Circulars distributed.

5. In collecting evidence I adopted very much the same course as I had previously done in Beds and Bucks, selecting one union in each county for close examination into all the circumstances influencing the condition of the labouring class, and paying short visits to other unions at the time of keeping my appointments with their boards of guardians, using, in fact, the board meeting as the best introduction to the employers of labour in the district. When keeping these appointments, where the time at my disposal would permit, I selected the nearest group of contiguous parishes for the sake of illustrating the condition of cottages as well as of receiving evidence from the labourers themselves; although, therefore, I have to submit to you evidence on the state of cottages in villages situated in most of the unions in both counties, the evidence on this subject, as far as my own personal observation is concerned, is chiefly confined to the unions of Woodstock in Oxfordshire and Wantage in Berks, and to groups of parishes in Abingdon and Bradfield unions, the former being all situated in Oxfordshire, and the latter in Berks. Mode of collecting evidence.

6. I am anxious to show by this sketch of the plan I adopted in collecting evidence that the state of cottages, whether good or bad, had nothing to do with the selection of the districts which I visited, and that the quantity, quality, and proprietorship of the examples which are given of this kind of accommodation may be taken as fair samples of both counties; there can scarcely be better labourers' dwellings than some of those which I visited, while others present a condition both externally and internally than which it would be difficult to conceive anything worse. Evidence on state of cottages.

7. My reasons for selecting the unions of Woodstock and Wantage for special examination will better appear if I give a slight sketch of the agricultural and geological features of the two counties; a glance at the map will show that when taken separately they are of very irregular shape, and dovetail into each other as their boundaries follow the windings of the Thames, when taken together they form a very compact district, which if bounded to the south by the line of the river Kennet would rest entirely on the cretaceous and oolitic formations, and would present only the agricultural features common to these formations. Geological formations, however, only produce what I have called agricultural features where they are so widely developed as to influence by their peculiarities a large extent of surface soil leading to a more or less uniform system of cultivation. Leaving then to the south of the Kennet the stiff clays and blowing sands of the tertiary formation, the first agricultural feature we have to deal with is the cultivation of the Berkshire downs and Chiltern hills, where the soil is light or heavy, according to the presence or absence of plastic clay, which here and there overlies the chalk, or forms with it a useful mixture of chalk flints and clay. Such land is usually described in the labour returns as "clay and flint on chalk," and is farmed generally in four course husbandry, with few other than the usual variations to prevent the too frequent repetition of clover seeds. When clay is absent from or Geological and agricultural features of the two counties.

* It will be seen that evidence of some or all of these descriptions is given from 64 parishes in Oxfordshire and 65 in Berks.

J.

only present to a very slight degree in the surface soil overlying the chalk, the clover seeds are allowed to remain two years, thus reducing the cost of labour and lengthening the ordinary four course to what is described in the labour returns for farms on such soil as five course, a course of husbandry which, however, must not be confused with the five-course system practised occasionally on the stronger and better soils in these counties, and which is, as it were, a lengthening of the four course by taking two white corn crops in succession after clover seeds and beans, thereby increasing the labour bill, and let us hope the value of the produce in a corresponding degree. Regularity of cropping is scarcely to be found on any two adjoining farms between the chalk downs and the stonebrash, a natural consequence of the frequent and very marked changes in the nature of the soil. The most noticeable features in this district are, 1st, the rich wheat soils composed of green sand, or the drift of green sand on gault and kimmeridge clay, lying in a line from Wantage to Wallingford, where owing to the comparative absence of root crops the cost of cultivation does not exceed that of the better down land; and 2nd, the active cultivation of the gravelly loams of the Thames valley, which by the continual interpolation of catch green crops into a four or five course husbandry sends up the cost of labour per acre on farms, with say one-fourth of their acreage in good grass, to from 40*s.* to 50*s.* an acre.

Moving northwards, the next agricultural feature arising from the geological formation on which the surface soil rests is the stonebrash district, covering a large area in the north of Oxfordshire, where the better land is usually cultivated in four-course husbandry. North of the stonebrash and covering a comparatively small area comes the "red land," which Arthur Young calls the "glory of the "county," where two white corn crops in succession in five-course husbandry is the most usual mode of cropping.*

Of these agricultural features, the most largely developed are the stonebrash farming in the north and the down farming in the south, the former receiving its best representation in Woodstock union and the latter in Wantage.

Effect of geological formations on health and habits of labouring

8. Besides giving examples of agricultural employment on land which covers the larger part of the surface of the two counties, these unions give good examples of the effect of geological formations on the habits and health of the labouring poor; the absence, for instance, in these two counties of the richer minerals which give rise to manufacturing industry, coupled with their inland position, compel the labouring class to depend almost entirely on their earnings as agricultural labourers, and to a certain extent shut them out from the opportunities possessed by labourers in other counties of obtaining higher wages in neighbouring manufacturing towns, and of so thinning the agricultural labour market as to raise the price of farm labour in proportion to the increased cost of living. As education advances and the old parish-dependent feeling dies out, aided by increased means of locomotion, and may be by a better administration of the poor law, this difficulty will no doubt be overcome. At present, however, the only accepted movement of the overgrowth of the agricultural population is what would be understood in these counties as the upcountry movement of lads and young men who seek service, many of them as grooms, in the direction of London, and the absorption as domestic servants of almost the entire girlhood of both counties. In this last respect these two counties present a great contrast to the straw plait and lace district of Bedfordshire and Buckinghamshire, where a native female domestic servant was rarely to be found. The influence of the geological formations on the health of the labouring class is observed in the more active and independent habits of the hill-men, who only suffer occasionally from the want of water, as compared with those of the vale-men who may be said to suffer from too much water.

Arterial drainage.

9. No district which I have ever visited in this country suffers more from the state of its arterial drainage and a general misunderstanding of the uses and abuses of water than the basin of the Thames, whether taken as affecting the success of agriculture or the health of its inhabitants, and no district requires a closer attention to these subjects to insure at least the second consideration, by providing wells on the chalk hills, where such luxuries are expensive, as has been done by Lord Macclesfield at Shirburn, and by preventing the pollution of the shallow wells on the stonebrash and Thames gravels, as has lately been done in one or two cases, given in evidence, under pressure of serious attacks of typhoid fever.†

Hiring in Oxfordshire.

10. Boys from about 13 years of age, lads, and unmarried carters are generally hired by the year throughout the county of Oxford, and where shepherds, cattlemen, and carters are not actually hired by the year there is usually a Michaelmas fee or mutual understanding which amounts to yearly hiring in so far that they are regularly employed throughout the year though at weekly wages, so that the farmer is not compelled to support them in case of sickness. This yearly hiring does not necessarily prevent them from increasing the weekly wage (usually 1*s.* a week more than ordinary day men in consideration of their Sunday work and longer hours by piece work), but as they are generally in charge of horses, cattle, or sheep, their opportunities of adding to the weekly wage are ordinarily confined to about a fortnight's reaping or fagging in harvest, and an increased wage of 4*s.* a day for about another fortnight when leading corn: the total addition under these heads would be about 5*l.* for the year, raising the average wage for carters and cattlemen to about 3*s.* a week more than the nominal weekly wage of day men. Shepherds have allowances, as at shearing and lambing time, &c., which increase their average weekly wage to 4*s.* or 5*s.* more than that of day men. Where hired men, as they usually do, receive Michaelmas money the sum given in that shape is calculated

---

* Course of cropping most commonly practised in Oxfordshire and Berks, where farming operations are best conducted, omitting the interpolated catch green crops, such as stubble turnips, rye, vetches, trifolium, mustard, and rape:—

1st. A four course, on good soil of all descriptions, except the very stiff clays, the wheat land of the green sand drift, and the best of the red land, consisting of ¼th roots, ¼th barley or oats, ¼th clover and beans, ¼th wheat.

2nd. A four course, on very stiff but drained clays, ¼th fallow, ¼th oats, ¼th beans and clover, ¼th wheat.

3rd. A five course on strongish deep land in high cultivation, ⅕th roots, ⅕th oats or barley, ⅕th clover and beans, ⅕th wheat, ⅕th barley or oats.

4th. A five course, on poor land (on stonebrash, sand, or flints on chalk), ⅕th roots, ⅕th barley, ⅕th clover and grass seeds, ⅕th second years seeds, ⅕th wheat or oats.

5th. A four course, on the green sand drift, ¼th fallow, ¼th wheat, ¼th beans, ¼th wheat.

6th. A six course, also on the green sand drift, ⅙th fallow, ⅙th oats, ⅙th clover, ⅙th wheat, ⅙th beans, ⅙th wheat.

On the stonebrash and stiffer land of the chalk downs, ⅓th of the arable land of a farm is often in sainfoin, which lies 4 or 5 years.

† As to wells on the stonebrash, Mr. A. Batt, M.D., Witney, says, "On the oolite, wells are often very near the surface, with privies and "pigsties too near them; it is very difficult to keep pollution out of wells on the stonebrash, where houses and wells are near "together."

to bring up the weekly wage to the standard I have described, and the object of making "the wage," as they term it, fall due at that time is evidently to secure the services of the labourer for harvest. The yearly hiring is from Old Michaelmas day (Oct. 11), and takes place at statute fairs which are also attended by grooms and female domestic servants for the same purpose. J.

The following are examples of evidence on wages and earnings received from occupiers of land in Oxfordshire who were obliging enough to extract it from their labour books for my use.

Examples of wages and earnings of agricultural labourers in Oxfordshire.

11. On three of the largest farms in Woodstock union, occupied by Messrs. R. J. Newton, Thos. Taylor, and Jas. Bulford, the average earnings of the different classes of men, exclusive of beer allowances which are only given in haytime and harvest, and journey-money given to carters, are:—

Enginemen	18*s.*	per week.
Head carters	16*s.* to 17*s.*	„
Shepherds	16*s.* to 17*s.*	„
Cattlemen	15*s.* to 16*s.*	„
Carters	14*s.*	„
Daymen	12*s.* 6*d.* to 13*s.*	„

The weekly wage for day-work upon these gentlemen's farms was, at the time of my visit (Nov. 1868), 11*s.*; on many, especially of the small farms in the neighbourhood, it had shortly before been sunk to 10*s.* for the winter months.

12. On the Duke of Marlborough's farm at Blenheim, according to a statement kindly given to me by Mr. Jas. Napier, the average weekly earnings of 35 able-bodied men, including the value of all allowances, were:—

2 foremen	20*s.* 6*d.*	per week each.
2 cattlemen	16*s.* 6*d.*	„ „
2 shepherds	21*s.*	„ „
9 carters	13*s.* 3*d.* to 15*s.* 9*d.*	„ „
20 daymen	14*s.* 6*d.*	„ „

13. An interesting return of the average earnings, including beer, age, and length of service of 24 men, comprising the ordinary staff of Mr. Jos. Druce's farm at Eynsham, will be found in Oxon evidence 30b; of these men, 22 are able-bodied, and, allowing 1*s.* a week for a cottage, and garden rent free, their average weekly earnings amount to 14*d.* 5½*d.* per man; the ages of these able-bodied men lie between 23 and 68 years; five men are over 60, one being 67 and another 68; four others are over 50, and only five of the 22 are under 40 years of age. As to length of service: one man has worked on Eynsham farm for 48 years, another for 47 years, another for 32, another for 30, another for 25, another for 24 years, and of the 24 men there are 16 who have served Mr. Druce for 10 years or longer. As an example of how long a farm labourer with fair health retains his power of maintaining himself, the average earnings of the five men who are over 60 are 13*s.* 3¼*d.* per week, the two men 67 and 68 years of age earn respectively 13*s.* 5*d.* and 13*s.* a week.

14. Mr. Jas. Scott, farm bailiff to Sir Henry Dashwood, in Bicester union, gives two examples of the earnings of daymen employed by him between Michaelmas 1867 and Michaelmas 1868:—

No. 1 (working at 11*s.* a week when at day work) earned 37*l.* 1*s.*, or an average for the year of 14*s.* 3*d.* per week.

No. 2 (working at 12*s.* a week when at day work) earned 39*l.* 16*s.* in 50 weeks, giving an average of 15*s.* 10¼*d.* a week for the year, notwithstanding the lost time.

Hiring, Berks.

15. The custom of yearly hiring from Old Michaelmas day, for plough boys, shepherds' boys, foggers, boys, under carters, carters, shepherds and cattlemen, is almost universal in the county of Berks, where boys, at least in Farringdon, Wantage, Hungerford, and Newbury unions, are not only employed younger than in Oxfordshire, but very generally seek and obtain a yearly hiring after they arrive at 10 years of age. In the down district their services are in great demand, and from some instances, which I have given in evidence, it will be seen that well-grown boys of 11 years of age commanded a wage of 3*s.* 6*d.* a week, with 30*s.* at Michaelmas; one boy of 11, whom I met in Bradfield union, was hired at 4*s.* a week, with 2*l.* at Michaelmas. These boys, as well as older lads and single men, are frequently lodged in the farmer's house, finding their own victuals, and on the large down farms are not unfrequently boarded or lodged with shepherds in "lone houses," out of the reach not only of their parents, but of any parental or educational influence which might be exerted by the clergyman of the parish. In Sparsholt parish (see Berks evidence, 26b) I found one little fellow of 8 hired for the year at 2*s.* 6*d.* a week and 10*s.* at Michaelmas (this boy was living with his parents); boys, however, are not usually hired by the year till after they have reached 10 years of age.

16. The yearly hiring, besides including the whole ordinary staff of boys and lads, from ploughboys to under-carters, includes one-third of the adult labourers employed upon a farm, the greater part of whom are carters; for these the usual terms are 1*s.* a week more than the ordinary weekly wage of daymen, with about 5*l.* at Michaelmas, or the Michaelmas money takes the shape of a cottage and garden rent free, and so much less money, according to the estimated value of the cottage and garden; or, as on some farms on the downs, 30*s.* at Michaelmas, with cottage and garden free, and a ton of coals delivered free; occasionally the Michaelmas money amounts to 6*l.*, but 5*l.* is more common, and where that is the case, the hill-carter with his cottage and garden free, a ton of coals (which would cost at his door about 25*s.*), and 30*s.* in money, is decidedly better off than his neighbour who receives 5*l.* in money. Besides receiving a shilling a week for Sunday work and long hours more than the average weekly wage of the district, and 5*l.* or its worth at Michaelmas, the carter is usually allowed by piecework in harvest to earn about 25*s.* extra, so that, exclusive of beer allowance, which may be worth 26*s.* a year (as estimated by Mr. Brown, of Compton, (see Appendix B, 12 a.,) or more, his average weekly earnings exceed the day-work wage of the district by from 3*s.* to 3*s.* 6*d.* a week. I have here taken no account of such variable allowances as beer and journey money, which on some farms cost the employer a good deal, without conferring much benefit on the labourer, the road or journey-allowance, for instance, is almost certain to go to the beershop, and may take with it some addition from the carter's private purse.

J.

17. Shepherds are hired in the same manner as carters, their Michaelmas money, however, varies from 6*l.* to 7*l.* or its value in cottage and garden, &c., and their perquisites at lambing, weaning, and shearing time, make the average weekly earnings amount to from 4*s.* to 6*s.* more than the nominal wage of the district; thus, for instance, in Wantage union, where the weekly wage for day-work varied from 10*s.* to 11*s.* (being more usually 10*s.*), the carter's place would be worth from 13*s.* to 14*s.* 6*d.* a week for the year, and the shepherd's from 14*s.* to 17*s.*, exclusive in both cases of beer and some variable allowances or perquisites not of much service to the labourer.

Examples of wages and earnings in Berks.

18. The following are examples of the evidence which I received on the rate of wages and earnings of agricultural labourers in Berkshire, from occupiers of land:—Mr. John G. King, who occupies about 1,500 acres in Beedon parish (Wantage union), says, "An able-bodied man on my farm ought to and does earn about 17*s.* a week for the year. I pay my carpenter, who works only for me, 17*s.* a week, and give him a cottage and garden free."

19. Mr. John Brown, who occupies 1,400 acres in Compton parish (Wantage union), thus estimates the value of a carter's wage:—

	£	*s.*	*d.*
Upstanding weekly wage at 11*s.* -	28	12	0
Michaelmas wage - - -	1	10	0
Cottage and garden free - -	2	12	0
One ton of coals and leadage - -	1	5	0
Piecework in harvest - - -	1	6	0
Beer allowance - - -	1	6	0
Allowance for journeys - -	2	12	0
	£39	3	0

An average of about 15*s.* a week for the year, and Mr. Brown continues, "I think the earnings of my daymen are about the same as my carters."

20. Mr. Luke Lowsley, another large occupier in Wantage union, gives a calculation of a down shepherd's wages, which amounts to a weekly earning of 15*s.* 3*d.*, exclusive of certain perquisites which might raise the value of the wage to about 16*s.* 6*d.* a week, but as one of the items entered against the shepherd is, "*keep of dog and tax*, 52*s.*" this estimate *with* perquisites, may be reduced to 15*s.* 6*d.* (there is, however, some difficulty in estimating the value of shepherd's perquisites).

21. The following is the weekly value of the wages paid to 16 *hired* labourers on Col. Lloyd Lindsay's farm at Lockinge, Wantage:—

Head shepherd - - -	18*s.*
Under shepherd - - -	16*s.*
Head carter - - - -	18*s.*
Married carters - - -	17*s.* to 18*s.*
Unmarried carters - - -	12*s.* to 14*s.* 6*d.*
Foggers - - - -	12*s.* to 16*s.*

Daymen on this farm received 13*s.* a week when working by the day; three of them were earning 17*s.* a week cutting chaff by the piece at the time I visited the farm.

22. Mr Castle, a large occupier in Wantage parish, puts the value of a carter's wage at 14*s.*, and that of married shepherds at from 16*s.* to 18*s.*; daymen he thinks might average 15*s.*

23. On the late Lord Radnor's farm at Coleshill, five daymen averaged 14*s.* 2*d.* a week between Michaelmas 1867 and Michaelmas 1868.

24. On Mr. Benyon's farm (Chalkpit), at Englefield in Bradfield union, six daymen averaged 14*s.* 1*d.* per week, for the year 1868.

25. On Mr. Thoyts' farm in the same union, enginemen have 18*s.* a week and no extras; carters and cowmen, 12*s.* a week, and 6*l.* at Michaelmas; shepherds 14*s.* a week and 6*l.* at Michaelmas in addition to some extra earnings in the case of carters, cowmen, and shepherd.

26. Mr. Thos. Tanner, a large occupier in Welford parish, Newbury union, gives the earnings of three daymen (whom he considers a fair average):—

	£	*s.*	*d.*		£	*s.*	*d.*
No. 1 earned in 1867	39	19	8	; in 1868	36	12	4
No. 2 „ „	40	9	6	; „	36	17	6
No. 3 „ „	36	0	2	; „	32	11	2

It will be observed that these three men (with equal opportunities and no loss of time from ill-health) held the same relative position as to amount of earnings during both years, but that, "owing to the "short quantity of roots grown in consequence of the unusually dry summer of 1868" (as stated by Mr. Tanner to me), their average weekly earnings for 1868 were only 13*s.* 7*d.*, as against 14*s.* 9*d.* for 1867, and this point must not be lost sight of when measuring the earnings of daymen by the examples given which are taken for the year 1868.

27. The wages paid on Mr. Walter's farms in Wokingham union are about the same as those given above for Mr. Thoyts'; the 6*l.* Michaelmas money taking the shape of an excellent cottage and garden of 25 poles, with 2*l.* in money. Drainers working by the piece on Mr. Walter's estate were making in January last 18*s.* a week.

28. Mr. George Ross, bailiff to Captain Walter, of Tangley, Wokingham, gives the same account of carters' wages as that given on Mr. Thoyts' and Mr. Walter's farms, stating the extra allowances as 3*d.* per hour for overtime (as in leading corn or hay), 6*d.* per day in lieu of beer in harvest, and 6*d.* per day for long journeys. On this farm everything that can well be is done by the piece, and Mr. Ross states that "strong active men can earn from 20*s.* to 22*s.* a week draining, and from 15*s.* to 22*s.* "trenching, with moderately dry weather."

A great deal more evidence on the subject of wages and earnings will be found in Oxon evidence Nos. 3, 9, 12, 16, 19, 20, 22, 23, 24, 25, 27, 34, 36, 37, 39, 41, 53, 55, 60, 61, as given by employers

and labourers, and Nos. 73 to 82, as given by relieving officers, and in Berks Nos. 4, 5, 8, 13, 15, 16, 18, 21, 26, 27, 28, 33, 38, 48, 50, 52, 55, as given by employers and labourers other than those quoted, and Nos. 74 to 78, as given by relieving officers. J.

29. Owing to the general practice of families working together in harvest, and the manner in which farmers' books are usually kept, I found some difficulty in ascertaining the actual payments made for 12 consecutive months, and more especially for a succession of years, to individual daymen, except the cases I have quoted, several of which are from farms of which the occupiers are also the owners, and it might be contended that they are not therefore fair examples; of the six cases, however, in which the actual payments made to daymen are given, two are from the books of tenant farmers, and will bear a very fair comparison with the payments made by gentlemen farming their own land. This difficulty, however, made me go more closely into the case of hired men, especially carters, whose wives or children only enter as a disturbing cause for a week or at most a fortnight's reaping. In counties, too, where, as in these, one-third or more of the adult labourers are hired by the year, and where, from the evidence of the labourers themselves, there is not much to choose between the dayman's earnings and those of the ordinary carter, I would at once accept his wage as the probable value of the earnings in an ordinary season of at least the better class of daymen. Day and hired men.

The carter's wage, sickness excepted (owing to a mutual arrangement between master and servant at the time of hiring, which does away with an important advantage northern labourers derive from their yearly hiring), is a certainty, but so is also the weekly wage of at least three-fourths of the daymen, the only uncertainty being about the additions from piece-work, which may make his earnings for the year greater or less than the carter's, according to the nature of the prevailing weather or the development of the love of piece-work in the breast of his master. The carter, however, has longer hours and Sunday work, considerations which, coupled in some cases with a dislike of horses or love of greater freedom of action, induce many labourers in these counties to work at their own hand rather than take carter's places; if, however, the carter's wage was appreciably raised above their own average earnings, there are quite a sufficient number of daymen fit to take carter's places to bring it down to the average earning of a fairly industrious day labourer. If then I was to enter on a farm in either Oxfordshire or Berks I would take the wages of the ordinary carter as the average cost of my whole staff of adult labourers, and I think that the evidence I have the honour of laying before you proves that at least two-thirds of the permanent staff of farms in ordinary years earn from 3*s.* to 3*s.* 6*d.* more than the nominal weekly wage for day-work of the district, and that the remaining one-third ought to, and I may say do earn within 1*s.* a week of the wage of their more fortunate or more able brethren. What proportion of the adult labourers whose usual occupation is farm labour this applies to will be seen from the difference between the winter and spring staff as given in the labour returns, which show that on 35 farms in Oxfordshire and 49 in Berks, extending over 16,536 acres in the former county, and 25,762 in the latter, about 5 per cent. of such labourers are thrown out of work during the winter quarter in Oxfordshire and about 3 per cent. in Berks.*

30. As far then as adult labourers who find regular employment in farm work are concerned, the earnings ought, in an ordinary season, to be:— Summary of evidence on wages:

For two-thirds of such men:

In North Oxfordshire from	13*s.* to 14*s.*	per week.
In South Oxfordshire from	14*s.* to 15*s.*	„
In West Berkshire from	13*s.* to 14*s.*	„
In East Berkshire from	14*s.* to 15*s.*	„

For the remaining one-third: of men;

In North Oxfordshire from	12*s.* to 13*s.*	per week.
In South Oxfordshire from	13*s.* to 14*s.*	„
In West Berkshire from	12*s.* to 13*s.*	„
In East Berkshire from	13*s.* to 14*s.*	„

i. e., no man in regular employment as day or hired man ought in an ordinary season to earn less than an average for the year of 2*s.* a week more than the weekly wage for day-work of the district in which he resides. This weekly wage varied at the time I was in the counties (winter) from 9*s.* in a few of the western parishes of Witney and Hungerford unions to 13*s.* in the neighbourhood of Windsor, but throughout almost the whole of North Oxfordshire and West Berkshire it varied from 10*s.* to 11*s.*, and throughout the greater part of South Oxfordshire and East Berks from 11*s.* to 12*s.* Where there was a variation of 1*s.* in particular districts, as was the case in Woodstock and Wantage unions, it arose from many farmers having sunk the wage 1*s.* a week for the winter quarter, while others, especially the larger, farmers had not made this reduction.

31. Young men of from 18 to 20 years of age who are hired earn from 8*s.* to 11*s.* a week. 7*s.* or 8*s.* a week, with 4*l.* to 6*l.* at Michaelmas, being common hirings. of young men;

32. Lads from 15 to 18 earn from 5*s.* to 10*s.* a week; 4*s.* to 8*s.* a week, with from 50*s.* to 5*l.* at Michaelmas, is the mode of hiring. of lads;

33. Boys from 12 to 15 are better paid in Wantage than in Woodstock union, the demand for their services being greatest in the down district. Their earnings in North Oxfordshire would be from 3*s.* to 5*s.* 6*d.* a week; in the down district of Berks 3*s.* 6*d.* a week, with 30*s.* at Michaelmas, up to 5*s.* a week with 50*s.* at Michaelmas, are common hirings. of boys;

34. Boys from 10 to 12 are also much more in demand in Wantage than in Woodstock union; they are rarely hired by the year in Oxfordshire, but very generally in West Berkshire, where 3*s.* a week with 20*s.* at Michaelmas, up to 3*s.* 6*d.* or 4*s.* with 30*s.* at Michaelmas, are common hirings.

35. Boys under 10 are not much employed in either county, except for odd jobs, when they earn from 1*s.* 6*d.* to 2*s.* a week in Oxfordshire, and from 1*s.* 6*d.* to 2*s.* 6*d.* a week in Berks.

* The difference in this respect in favour of Berks is owing partly to the average size of the farms given in that county being greater (525 acres against 472), partly to the thinner population in the down district from which a considerable number of the Berks returns come, and partly (I think chiefly) to the much larger proportion of grass to arable land in the case of the Oxfordshire farms as compared with those given from Berks.

J. of women.

36. The ordinary wage for women employed by the day in both counties is 8*d.* for a working day of eight hours, with an increase of 1*d.* per hour for extra hours; when working with men, as in thrashing, they are usually paid 1*s.* a day. In Woodstock union some farmers pay 9*d.* a day for eight hours' work, and on the Berkshire downs nine hours' work are exacted in summer for 8*d.* In the neighbourhood of towns women can command 1*s.* a day, as about Henley-on-Thames. In harvest women do piece-work with all the other available members of their families, very small children helping to make and lay bands. A man and his wife, with the help of a child, if both are strong, can fag and tie an acre in a day, for which 10*s.* is a common price. The average earnings of a man and his wife for the harvest month will amount to about 6*l.*, or about 30*s.* a week for a month. Some couples can earn as much as 7*l.*, or even 8*l.*

Employment of women in farm labour;

37. The proportion of adult female field-workers is about 1 to 100 acres in both counties; of these about one-half in Oxfordshire and about three-fifths in the down district of Berks are employed, weather permitting, in winter, the field work therefore of one-half of the women workers in Oxfordshire, and two-fifths of those employed on the downs of Berks, is confined to about seven months, including harvest, and their earnings to say an average of 3*s.* a week for six months, and about 2*l.* for harvest; in all 5*l.* 18*s.* for the year; those who work in winter at an average of four days a week for 20 weeks would add 2*l.* 13*s.* 4*d.* to this, making a total for the year of 8*l.* 11*s.* 4*d.*; few, however, I should think, average four days a week for the winter months. Girls are so little employed that it is hardly necessary to enter into their wages, which would be from 4*d.* to 6*d.* a day up to about 16 years of age, when they would rank as women.

in glove sewing;

38. In those parishes which lie in a circle, with a radius of about seven miles round Woodstock women and girls (from about 12 years of age) are very much employed in sewing gloves. At the time I was in Woodstock a girl of about 16 working in a glove factory would earn from 3*s.* to 5*s.* a week, working at home such a girl would earn about 2*s.* 6*d.* and a woman 3*s.* a week. I was informed that when trade is brisk a good sewer would earn from 4*s.* to 6*s.* a week, working from 10 to 12 hours per day. Though a girl begins to sew gloves at 10 or 12 years of age, she seldom earns anything till she is about 13. A glove manufacturer in Woodstock told me that he would not employ any girl under 13 on his premises, "because the Workshops' Regulation Act is so troublesome."

in slopping.

39. Slopping, *i.e.*, finishing machine sewn clothes for working men, such as trousers, waistcoats, and smocks for railway labourers, finds employment for women for seven or eight miles round Abingdon. Most of this work is done by married women who lose time by having to attend to their domestic duties and may add from 2*s.* to 3*s.* a week to the family purse; those who are not "hindered," as the glove sewers would say, by having to attend to other duties, can earn about 4*s.* a week, but have to work late to do it.

Farm management as affecting labourers.

40. Before reviewing the evidence more closely, as it serves to answer the questions asked in the Commissioners' circulars of inquiry, I would like to draw your attention to some features in the management of farm labour as it affects the interest of those employed, using for that purpose the labour returns and the evidence of persons who take a deep interest in the welfare of the farm labourer, as well as the success of agriculture.

Increase in size of farms.

41. First then, as to the effect of the increase in the size of farms and greater use of machinery. It is a common complaint amongst those labourers who find themselves out of work (of whom there was an unusual number during the past winter) that this is caused by the tendency to increase the size of holdings, and in this feeling they are backed up, as will be seen from the evidence, by the opinions of several relieving officers whom I questioned on the subject; if, however, you examine the labour returns you will find that they show very little difference in the number of persons employed in proportion to the acreage as between large farms and small, say as between farms of less than 300 acres as compared with farms of from 500 to 800 acres, and the reason I believe is this, that the tendency to increase the size of farms has as yet only kept pace with improved cultivation; that, in point of fact, the larger farms are, as a rule, more highly cultivated, and that therefore the natural reduction in the proportionate staff of labourers which the extension of the area would allow has, as yet, been counteracted by better cultivation, this higher style of farming being partly caused by placing more land in the hands of a more intelligent class of tenantry, but in a much greater degree by putting it in the power of a farmer to employ profitably all or many of the more expensive mechanical aids which are out of the reach of the ordinary tenant of a small farm.

Agricultural machinery

42. The great improvement which has recently taken place in agricultural machinery has, no doubt, enabled the farmer to do by its aid many things which he formerly did by the more costly and tedious process of manual labour, but it has at the same time enabled him to do many things which he certainly would have left undone if he had had only manual labour to depend upon, and the result is that "as far as we have got yet," as the natives of the country to which we owe many of our most useful farm implements would say, the things formerly left undone and which are now done are so many that the manual labour necessary to serve the machinery which does them, requires as many hands as were needed to do the few things which were formerly done.

The greater use of machinery and the increase in the size of farms, which may be said to run in couples, have not only conferred a great benefit on the farmer and the country at large by increasing its productive power, without, at any rate as yet, diminishing in any appreciable degree the number of persons for whom agricultural labour finds employment, but they have also tended to equalize the manual labour required during the different seasons of the year, and to provide more skilled labour at higher wages for industrious and intelligent labourers, than which no greater benefits could be conferred on the agricultural labouring class.*

* The following is the opinion of Sir Henry Dashwood on this subject (see Oxon evidence 93). "Whatever improves the agriculture "of a district must also improve the state of the people living in the district. Improved agriculture implies improved cultivation, "expensive and often complicated machinery and implements, superior horses, valuable stock, &c.; all these require responsible and "intelligent labourers, who can only be retained by fair wages and cottages within easy distance of their work."

Mr. Thos. Tanner, a large occupier in Newbury union (see Berks evidence 59) says, "I do not think a scarcity of labour would "injure to any great extent the employer or the employed, as we should bring machinery to our assistance, and we should soon get a "more intelligent class of workmen."

Mr. Simmons, bailiff to Mr. Walter (see Berks evidence 62) says, "The use of the steam plough reduces the number of horses and "therefore of carters; it makes way however for some labourers at higher wages."

J.

It has been often said to me that the great increase in the size of farms is to be regretted, as it deprives the provident and industrious labourer of the old inducement to save money in order that he may himself become a farmer and a master, large farms being altogether out of his reach. An increase in the size of farms no doubt has this tendency, but for one man who was induced to be provident by the hope of reaching the grade of a farmer through the agency of a small farm, 10 I feel sure, will be benefited by the increase in wages which the use of machinery offers to intelligent men and the whole class encouraged to make more use of their brains.

I think, however, the custom of increasing the size of farms may be easily carried too far, and happily the power of hiring the steam plough and thrashing machine will soon enable the occupier of a very moderate sized farm to compete on fair terms with his richer neighbour in showing that increasing difference between the cost of production and value of the produce which is the measure of successful farming both for the farmer and the country.

as used in Oxfordshire and Berks shows agricultural labour market is overstocked.

43. In both Oxfordshire and Berks the use of agricultural machinery has evidently made great progress since Mr. C. S. Read wrote his prize essay on the farming of Oxfordshire (in 1854), with, however, one or I might say two notable exceptions, viz., the comparatively little use that is made of either mowing or reaping machines. It would certainly strike most farmers with wonderment that the same men who possess the fee simple of a steam cultivator, frequently, I may say generally in these counties, are the owners neither of a mowing nor reaping machine. When I mentioned this, as I did to several farmers, their answer was either that they could get plenty of hands to cut their corn, or, that if they reaped their upstanding corn with machines their men would refuse to cut what the machines could not. Judging from the number of men I found out of work in winter in the open villages, there are no doubt many hands available for haytime and harvest, which can find very little farm work to do at other seasons, but it seems to me that one of the great advantages of using mowing and reaping machines would be to drive away these surplus labourers who drag out a miserable existence depending almost altogether on a payment, part of which might be saved to the farmer and the rest better spent in increasing the wages and thereby improving the quality of his permanent staff. The action of the farmer has, however, for years past had an opposite tendency: before the Union Chargeability Act came into force the farmers helped such men through the winter by giving them odd jobs at the lowest wage which would induce them to remain, and serve at the same time to keep them off the rates; now, since rates have become a district charge the inclination is, by a pretty free use of outdoor relief, to help these men to tide over the winter by the aid of public instead of private charity, and so it comes to pass that an Act of Parliament which ought only to have done unmitigated good to the labouring class is made the means of encouraging pauperism.*

Plough-reins versus ploughboys.

44. Another peculiarity in the farming economy of Oxfordshire and Berks bears upon the educational question, and perhaps oddly enough, as it is a question of horses. That there is land in both Oxfordshire and Berks which no two horses of whatever breed could break up at certain seasons of the year, no man who has seen and felt the tenacious character of the soil in winter would, I think, for a moment doubt, but the evidence of facts on all the farms occupied by landowners which I visited and on many occupied by tenant farmers, as well as the strong opinions expressed by practical men who know the counties well, warrant me in saying that one-half of the ploughboys might be dismissed and sent to school on the back of one of the horses along side of which they used to crack their whips, leaving the remaining two horses with the aid of a pair of reins and a larger allowance of corn to sharpen the steps of the ploughman.†

Private gangs.

45. Passing now to a closer review of the evidence as it bears upon the questions asked in the Commissioners' circulars of inquiry, and treating the subjects in very much the same order as they are presented in those circulars. It will be seen that the only return I received of children, young

---

* In a paper on the systems of local rating in England, Scotland, and Ireland, read by Captain Dashwood, a large occupier of land in Oxfordshire, at a meeting of the Central Farmers' Club on the 5th of April, he says, "I need scarcely point out to you that the main "blot on our poor law management is the great abuse made of outdoor relief, which resolves itself in many instances to relief in aid "of wages."

† Extract from Mr. Sewel Read's prize essay on the farming of Oxfordshire.—"The farmer of the old school delights to see his five "horses elaborately doing the work of two; and points with exultation to the instances in which men who started with pair horse ploughing, "no doubt strangers, ignorant of the nature of the soil, in making the attempt to plough heavy ground with a pair of half fed cobs "failed of their object. They started on the wrong soil with the wrong horses, and wrong feeding for pair horse ploughing. On a "great portion of Oxfordshire land two strong horses are enough in a plough, but they must be active and well fed. On the stonebrash "may be seen three or four horses crawling over three quarters of an acre in the day, while on the other side of the hedge two horses "are ploughing their acre with ease."

Mr. John Hedley, bailiff to Mr. Wroughton, of Woolley Park, Wantage, says, (see Berks evidence 76), "I plough with two "horses abreast and use short carts instead of waggons. You will see in Mr. Wroughton's field four ploughs going, with eight "horses and four men, and over the fence on another farm four ploughs with 12 horses, four men and four boys, on the same "kind of land, our ploughs doing the work quicker. There is nothing in which the northern system beats the southern so much as in "the management of horses. Our horses are kept in the stable, our neighbour's lie out in a yard; our horses are well fed, and two of "them do more work than three of the neighbour's, and we don't require the ploughboy. It would be a far better system if the plough-"man had charge of his horses as ours have, and received the boys wages in addition to his own, the boy remaining at school. The only "difficulty I have in carrying out the two-horse system is that we have no cottages for ploughmen."

Mr. Hardy, bailiff to Col. Lloyd Lindsay, Lockinge, Wantage (see Berks evidence 236), says, "We use very few boys, as we plough "mostly with reins and a pair of horses, and I have sent for tackle to use three abreast with reins when we want more than two, as we "do sometimes. It's all nonsense about three horses abreast doing more harm than three or four in a line on wet land; the surface "you turn over is less trodden with three or four in a line, but they make a fine water bed in each furrow, that is forgotten, because it is "out of sight. Some of our land is as stiff as any in the neighbourhood. We have two Clydesdale mares; they will plough as heavy "land as any three of the ordinary Berkshire horses and do it quicker."

List of farms visited by the Assistant Commissioner on which plough-reins are used and plough boys dispensed with in Oxfordshire:—

The Duke of Marlborough's farm at Blenheim, Woodstock.
The Earl of Macclesfield's farm at Shirburn, Thame.
Sir Henry Dashwood's farm at Kirtlington, Bicester.
Colonel Bowyer's farm at Barton, Woodstock.
Captain Dashwood's farm at Kirtlington, Bicester.
Mr. Newton's farm at Begbroke, Woodstock.

In Berks,—Her Majesty's farms at Windsor.
Col. Lloyd Lindsay's farm at Lockinge, Wantage.
Mr. Wroughton's farm at Chaddleworth, Wantage.
Mr. Benyon's farm at Englefield, Bradfield.
Mr. Thoyts' farm at Sulhampstead, Bradfield.
Mr. Walter's farm at Bearwood, Wokingham.
Captain Walter's farm at Tangley, Wokingham.
Besides several on lighter land.

It will be apparent to anyone who knows the district that these farms, adding the light land about which there is no dispute, represent the surface soil of at least three-fourths of the two counties.

J. persons, or women employed in private gangs (there are no public gangs employed in farm labour in either of these counties) was from Kirtlington parish in Oxfordshire, where an occupier of a large farm employs two mixed gangs of boys and girls for four or five weeks in May and June hand weeding corn which has been horse-hoed; these gangs are composed of about 30 boys and as many girls, and of the 60 who were so employed during last summer, there were—

14 boys and 5 girls under 10 years of age.
11 boys and 13 girls between 10 and 13 years of age.
5 boys and 12 girls over 13 years of age.

About one-third of these children live on the farm, and the remainder come from a village two miles off; the hours of work are from 8 a.m. to 4 p.m., with an hour allowed for dinner. The 60 children are divided into two mixed gangs, each gang being under the charge of a steady married labourer.

Speaking of the manner in which these children are employed, their employers say:—

"I thought of dividing the sexes, but found it was not advisable, as the children of a family came togther and brought their meals together, the elder children taking charge of the younger; they are not subject to any ill-treatment, nor are they in any way injured by the nature of their employment; they are never employed in weeding high wet corn. . . . I do not think that any legislative enactment is necessary for such private gangs as these. . . . The state of education of the children is, however, unsatisfactory; there are schools, but the children are not very regular in their attendance."

In point of fact, the temptation of earning a little money by pulling charlock for seven hours on a fine day in May or June has its natural effect on the school attendance, and I perfectly agree with the employer of these gangs to this extent, that no legislation is necessary to protect these children from the chance of suffering physical injury, and that a rule for separating the sexes while at work would interfere with the family arrangements without giving any moral protection. As to legislative interference for the sake of education there is this to be said about the employment of children in gangs, that inasmuch as it is the only profitable way of employing children under 10 years of age, such institutions are serious temptations to both employers and parents to forget that children of that age might be even better employed than in earning 4*d.* or 6*d.* a day in light summer work.

their effect on education.

Tabulated labour returns.

46. The tabulated labour returns (Oxfordshire evidence, Appendix A., and Berks evidence, Appendix A.) will show the age at which children begin to be employed in farm labour, to what extent youthful and female labour is employed in comparison with adult male labour, and to what extent the demand for manual labour varies throughout the year. These forms will also indicate to what extent the manual labour on a farm is affected by the proportion of arable and pasture land, the course of husbandry, the nature of the soil, and the use of steam cultivation and the more expensive machinery which is generally confined to the larger farms.

Extra harvest hands omitted.

47. As it is the custom in both counties for families to work together in harvest, taking the reaping and binding by the acre, it is very difficult for a farmer to give a return of the age, sex, and number of persons employed on his farm during harvest, and the same remarks will apply to hay-time, very few of the persons making the returns (8 out of 36 for Oxford, and 10 out of 49 for Berks) made any attempt to include "extra-strappers" in harvest, and if they had done so it would only have been to show that every available man, woman, and child in the rural districts is at work for a longer or shorter time in hay-time or harvest as the state of the weather shortens or protracts the work. The Oxfordshire return for autumn is slightly confused by one or two farmers having treated harvest as autumn work, while others who gave extra harvest hands put them in the summer quarter. In the Berkshire autumn return extra harvest hands are entirely excluded, and it will be seen that the spring and autumn staff are practically the same, and that the spring returns give very accurately the whole number of persons who are regularly employed for three-fourths of the year; the difference between that and the winter return showing how many of those persons whose usual occupation is farm labour are thrown out of work during the winter months.

Ordinary staff employed on 42,298 acres during three-quarters of the year.

48. The following is the return of the labourers, male and female, employed during the spring quarter (and which may therefore, as I have explained above, be taken to represent the age, number, and sex of persons employed for three-fourths of the year) on 16,536 acres in Oxfordshire and 25,762 acres in Berks.

—	Number of Farms.	Acres Arable.	Acres Pasture.	Total Acreage.	Males.						Females.						
					Under 8.	Between 8 and 10.	Between 10 and 13.	Between 13 and 18.	Over 18.	Total Males.	Under 8.	Between 8 and 10.	Between 10 and 13.	Between 13 and 18.	Over 18. Married.	Over 18. Unmarried.	Total Females.
Oxfordshire -	35	11,238	5,298	16,536	—	8	89	113	554	764	—	—	1	10	130	20	161
Berkshire -	49	18,920	6,842	25,762	—	10	107	245	747	1,109	—	3	4	23	257	17	304

Parish labour returns of males under 18 years and females.

49. Taking the returns made by clergymen for their parishes, as given for nine parishes in Oxfordshire (seven of which are from Woodstock union), which returns include females of all ages, but only those males who are under 18 years of age, we have,—

—	Population.	Acreage.	Males.				Females.					
			Under 8	Between 8 and 10.	Between 10 and 13.	Between 13 and 18.	Under 8.	Between 8 and 10.	Between 10 and 13.	Between 13 and 18.	Over 18. Married.	Over 18. Unmarried.
Nine parishes in Oxfordshire -	3,124	14,490	2	16	66	91	—	—	1	2	84	9

J.

These parish returns only differ from the farm returns by showing a rather larger proportion of boys under 10 years of age, young boys occasionally employed on odd jobs being given by the clergyman and omitted by the farmer. The few parish returns which I received from Berks in no way affect any inferences which may be drawn from the farm returns.

The 42,298 acres chosen give a fair representation of the quantity and quality of labour employed in the two counties.

50. It is evident, therefore, that very few boys under 10 years of age find anything like regular employment in farm labour in either county; that after 10 they are very generally employed in both; that female labour is very generally confined to the employment of married women, by whom a good deal of the lighter farm work is done in both counties; that the extent to which children, young persons, and women are employed is very similar in both counties; in fact, it will give a more accurate measure of the distribution of agricultural labour in both counties if we add the labour returns together, and for this reason, that in collecting labour returns in Berks I kept in view the development of the farming features of the district, my endeavour being to obtain a fair proportion of acreage from each; what therefore is lacking from the down farms in Oxfordshire is supplied from Wantage union in Berks. As the vale farms in both counties contain a much larger proportion of permanent grass than the farms on the stonebrash or chalk downs, it will be some indication that by adding these labour returns together a fair sample of the two counties is obtained, that the proportion between the pasture and arable land in the 42,298 acres over which the combined labour returns extend is the same as that between the whole arable and pasture land in both counties, as given by the "Agricultural Returns for 1868," viz., a proportion of 3½ acres arable to one pasture.*

Adding then these labour returns together the account stands thus:

Employment on 42,298 acres in Oxfordshire and Berks, of which 30,158 are arable.	Males.						Females.						
											Over 18.		
	Under 8.	Between 8 and 10.	Between 10 and 13.	Between 13 and 18.	Over 18.	Total Males.	Under 8.	Between 8 and 10.	Between 10 and 13.	Between 13 and 18.	Married.	Unmarried.	Total Females.
In regular employment for three-quarters of the year	—	18	196	358	1,301	1,873	—	3	5	33	387	37	465
In regular employment for winter quarter	—	13	184	353	1,254	1,804	—	—	3	21	216	29	269

Proportion of youthful, female, and adult male labour to acreage.

51. The following, then, are the conclusions I would draw from this statement, in addition to those already stated in considering the returns from the two counties separately (conclusions which apply equally to both counties).

That the proportion of boys between 10 and 13 who are regularly employed in farm labour is about 1 to 200 acres of mixed cultivation (this proportion being greater in North Oxfordshire and West Berks than in the other parts of the counties), and that of these 6 per cent. are thrown out of work in winter.

That the proportion of lads between 13 and 18 who are so employed is about 1 to 120 acres, very few of whom are thrown out of work in winter.

That the proportion of adult male labourers who are employed throughout three-fourths of the year is, on an average, one man to from 32 to 33 acres of mixed cultivation, and that nearly 4 per cent. of these are thrown out of work in winter.†

That very few girls and comparatively few unmarried women are employed in farm labour, except in haytime and harvest.

That of adult women, nine-tenths of whom are married, the proportion employed for three-fourths of the year (*i.e.*, in spring, summer, and autumn) is about 1 to 100 acres, of whom rather less than half, either from choice or necessity, are not employed in the winter quarter.‡

Boys' work.

52. The hours of work for boys who are not carters' or shepherds' boys, are the same as those for ordinary daymen, viz., 10 hours, exclusive of time allowed for meals, in summer, and as many hours, not exceeding 10, as light will allow in winter. On some farms, however, as will be seen by the answers to the circular question, "What are the hours of work?" men and boys work for 10½ hours per day. Carters' boys, *i.e.*, those who help the carters, who have charge of horses are expected to be in the stables soon after 4 a.m., when they bait their horses, at 6 they are allowed an hour for breakfast, from 7 a.m. till 3 p.m. they drive the team in the field, having a rest of from 15 to 30 minutes for luncheon at 12 o'clock, after putting in the horses at 3 they are allowed till 4 o'clock for dinner, and are in the stables again baiting and doing up their horses till about 6 p.m.; they therefore have 11 or 12 hours work, less the 15 or 30 minutes for luncheon, according as they are in the stables at 4 or 5 a.m. As the carter usually has charge of two teams, these hours apply to nearly one-half of the boys (who are not old enough to hold a plough) employed on farms where ploughboys are used.

The long hours of the carter boy are by several witnesses considered to be injurious to his health, and it is said that where such boys are hired by the year, and lodged either with the carter or in the farmer's house (a very common custom in Berks) they are often subject to rough usage at the hands of the carter.

* The whole of the land accounted for in the Agricultural Returns for 1868, in both counties, as in permanent grass (exclusive of heath, waste, &c.), or arable cultivation, was 759,024 acres, of which 243,561 acres are permanent grass, giving a proportion of 1 acre of grass to 3·52 arable. The proportion in the acreage to which the labour returns apply is 1 acre grass to 3·48 arable.

† An inspection of the individual returns as given in Appendix A. of the evidence from both counties will show that this proportion of one adult man to from 32 to 33 acres for such mixed cultivation as is above described applies to a large number of farms on the better stonebrash and down lands where four-course husbandry is practised; that this proportion rises to one man for 25 acres where three-fifths of the arable land in high cultivation is annually in white corn, and sinks to one man for 50 acres on the poorer stonebrash and down farms where two-fifths of the arable land only is in white corn; on a few very highly cultivated farms on sandy loams or the Thames gravel it rises to one man for 25 acres in four-course husbandry.

‡ Examining the returns individually it will be found that female labour falls below this average round Woodstock and Abingdon, where gloving and slopping provide other employment for women, especially those with young families, but that in spite of these inducements to remain at home, there are a considerable number of women who prefer field work to sewing either gloves or navvies slops; see also Oxfordshire evidence 19a and 55b.

J.

The evil effect on the feet and limbs of boys, arising from the tenacious character of the soil over which many of them have to drive their team for eight hours in succession, was pointed out by several witnesses, and on this head Dr. Batt of Witney says (see Oxon evidence 72), "I think that children "are employed too young in heavy ploughed land; it tells on them in after life; when they get to be "about 50 they go at the knees and are very much bent." On the other hand, with the above exception, the medical evidence which I have received speaks very favourably of the health of the agricultural labouring class in these counties. Mr. Parry, a surgeon practising in Woodstock union, says, "I "cannot attribute any particular disease to farm labour, and the people in this district are, as a rule, "very strong and healthy, living to a great age." Dr. White, district medical officer of Woodstock union, says, "There is no reason to suppose that agricultural labour in this district is injurious to the "health of those engaged in it." That farm labourers are not so healthy as they should be Dr. White attributes, 1st, to "low wages, which will not allow men with families to procure food sufficient either "in quantity or quality; and, secondly, the unwholesome state of many of the cottages." Again, Dr. White says, "It is a rare event to find a sick child whose illness can be ascribed to its being "employed in field labour at too tender an age."

Although, therefore, I think that the long hours of the carter boy are unsuited of the age of many of those who are employed in that capacity, and attribute the peculiar gait of the male agricultural labourer in these and the adjoining counties to the effect of the sticky land (perhaps aided by tight leggings), on the feet and legs of the team boys, I am bound to confess that where these are, as I believe they are in Oxfordshire and Berks, the chief subjects of complaint, in a physical point of view, against the mode of employment in agriculture, I agree with the great majority of witnesses who say that *legislative interference for the sake of protecting children from physical injury supposed to arise from the manner in which they are employed in farm labour is not necessary.*

Female workers.

53. As very few young girls are employed in farm labour, and as the work of those few who are is of the lightest description, it is scarcely necessary to discuss the desirability of legislative restrictions on their account; any restrictions on the employment of such girls deemed necessary elsewhere might be applied here without injury either to the parent or employer.

Effect of employment of females in farm labour morally and domestically.

The complaints made, in answer to the circular questions, against the employment of females in agriculture, and the suggestions for legislative restrictions on such labour, apply generally to the case of the elder girls, young women, and married women; of the elder girls and young women it is said that field labour unfits them for domestic service or domestic duties when married, and subjects them to immoral influences (chiefly, as would appear from the evidence, from the conversation of the elder women with whom they work); of the employment of married women it is said that it leads to the neglect of their families and domestic duties.

Some witnesses speak very strongly on this subject, as, for instance, the Rev. B. Tyrwhitt, of Lockinge, who says:—

"It (*i.e.*, farm labour) is the certain ruin of the female character; they become bold, impudent, scandal-mongers, hardened against religion, careless of their homes and children, most untidy, given to drink, coarse-minded, debased, depravers of any virtuous girls who work with them, having no pride in their home or their children, and few home feelings. Their children are ragged and quite untaught, and a dirty home often drives the husband to the public house."

These are indeed heavy charges to bring against the married female farm workers of Berks, and one of them, that of using coarse language, is so often repeated that we needs must believe that coarse language is a characteristic of the adult female field worker in these counties, the Rev. G. Purdue, of Challow, says:—

"'*Field talk*,' is a common expression in this neighbourhood (Wantage) when women talk loosely."

From the opposite end of the counties the Rev. W. H. Ridley, of Hambledon, says: "It (farm labour) is very injurious to them *morally*; they gain coarse, rough, and immoral habits; it is very injurious *domestically*; their homes and families are miserably neglected."

The neglect of their families is such a natural result of the absence of the mother in field work that it is scarcely necessary to quote the opinions of witnesses on this subject; I must, however, in justice to the married female field workers state, that, as far as my own personal observations are concerned, there was not much to choose between the comfort and cleanliness of their houses and those of their neighbours' who were not engaged in field work, and it was the opinion of many labourers, as well as as labourers' wives, whom I examined on this subject, that the best wife for a farm labourer is a woman who is able and willing to do farm work.

In Wantage parish I visited the house of a labourer's wife, named Ranklin (see Berks evidence 27d) within half an hour of the time when Mrs. Ranklin, who is 65 years of age, had returned from field work (spreading dung), and I was very much struck not only with the tidiness of the house, but with the cheerful and contented tone of its mistress; the following is her evidence on the subject of female labour:—

"I have worked out since I was a girl, at first with my father. People never work out now like what girls worked when I was young. Working out in the fields is good for women; does young women good. A girl going out with married women may hear a good many things she shouldn't; it greatly depends upon whom she works with. I wouldn't like to send a girl out till she's 12 or 13; I don't think after that the eight hours' work would hurt her. It would be a great deal better for women with families to stay at home; they lose as much as they get by not looking after their families, and it would be a good thing if women hadn't to work in winter."

Effect of such employment physically.

54. As to the physical effect of field work on females the evidence shows strongly that such work, if not distinctly favourable to health, at least contrasts favourably with the other employments, such as factory work, gloving, slopping, and lace-making, in which women of the labouring class in these counties are engaged; there can be no doubt, however, that the effect for good is greatly counteracted by the miserable dress worn by most of the women workers; their husband's coat and an apron cut from an old manure bag may keep out a certain amount of rain from the upper part of their person, but the slipshod feet can rarely remain dry for half an hour on an ordinary winter's day.

J.

55. Nor do I think does any evidence which I have received show that field work has a worse moral effect upon females than the other employments in which they are engaged in the counties I have visited as your assistant commissioner. Where, for instance, as in Woodstock union, gloving is a more usual employment than field work, especially for younger women, there are as many complaints of its evil effect on the morality of the girls as are made elsewhere of the like effect arising from field labour; the same may be said of lace-making in the western parishes of Oxfordshire, and you will remember what very strong evidence was given on this subject in the plaiting districts of Beds and Bucks. In point of fact, almost every person who has had the means of comparing the moral effect of any one of these occupations with farm labour has given his opinion in favour of farm labour as producing less moral evil amongst young women.

Morally, farm labour as a female employment compares favourably with such occupations as straw-plaiting, gloving, and lace-making.

The result of all the evidence I have received on the subject of female occupations as tending to immorality leads me to this conclusion: that unhappily a disregard of chastity is very common amongst unmarried women of the labouring class (my evidence only concerns the labouring class), and that one occupation only differs from another as it affords more or less opportunity for the gratification of what after all is a natural passion, or as by its nature it encourages the development of that passion. Agricultural labour affords as many or more opportunities of evil as any of the occupations I have named, with the exception of straw plaiting, but the healthy hard work is a great corrective, and it is on this last account chiefly, I think, that the morality of the girls engaged in field work will compare favourably with that of those whose occupation is lace-making or gloving, and is, as far as the evidence I have received is concerned, decidedly greater than that of the straw-plaiter.

I have dwelt somewhat at length on this subject, because, if it be true that a slight appreciation of the virtue of chastity prevails generally amongst the labouring class, in whatever occupation the girls may be engaged, the fact points to some widely prevailing cause, which deprives the young women of the safeguard of female modesty, and that prevailing cause (in spite of the inferences which may be drawn to the contrary from the supposed or really greater chastity of Irish and Highland girls) I take to be the overcrowding of cottages.

Although then I agree with those witnesses who think it a great pity that married women should neglect their families for field work, I agree also with those who think that *any legislative restrictions on the employment of females in agriculture in Oxfordshire and Berks are unnecessary.*

56. Passing now to a review of the school returns, in order to show the proportion of children of the agricultural labouring class under 13 years of age who are receiving any elementary education, as well as the effect of the employment of children in farm labour on school attendance.

School returns.

Table A. of the Oxfordshire summary of school returns gives the total number of children of the agricultural labouring class under 13 years of age *on the register*, as well as *in average attendance* at all the elementary schools in *Woodstock union*, and the account stands thus: that in a union almost purely agricultural, extending over 47,913 acres, and containing according to the census of 1861, 14,236 inhabitants, there are of the class named *in average attendance* at some elemetary school,—

Woodstock Union.

In summer	497	boys under 10 years of age.
	97	„ between 10 and 13.
	526	girls under 10 years of age.
	138	„ between 10 and 13.
Total children under 13	1,258	
In winter	500	boys under 10 years of age.
	112	„ between 10 and 13.
	508	girls under 10 years of age.
	137	„ between 10 and 13.
Total children under 13	1,257	

And that there are *on the register* of the same schools,—

In summer	1,542 children under 13.
In winter	1,625 „ „

Supposing that 80 per cent. of the population (the same per-centage which I allowed in analysing these returns for the counties of Bedford and Buckingham) belong to the class for which these returns are made, it would appear that there is one child under 13 years of age *on the register* of some elementary school for every seven persons, and one such child *in average attendance* for every nine persons (it will be remembered that a like analysis of a similar return for all the elementary schools in Woburn union in Beds gave one such child *on the register* of some school for every $8\frac{1}{2}$ persons, and one in average attendance for every 11 persons). Of the children under 10 years of age there are 6 per cent. more girls than boys in average attendance in summer, and about $1\frac{1}{2}$ per cent. in winter. Of the children between 10 and 13 years of age, the girls exceed the boys by about 40 per cent. in summer, and by about 20 per cent. in winter.

57. Taking the returns from six rural parishes in five of the other unions in Oxfordshire (Witney, Banbury, Bicester, Thame, and Henley), and allowing the same per-centage of the population to belong to the class for which the returns are made, we find (see school table B. of Oxon summary) that there is one child under 13 years of age *in average attendance* for every $8\frac{1}{2}$ persons (the exact figures being 8·6 in decimals) both in summer and winter, and that of the children under 10 years of age the attendance of the boys exceeds that of the girls by about 6 per cent. in summer and 4 per cent. in winter, whereas of children between 10 and 13 the attendance of girls exceeds that of boys by about 50 per cent., both in summer and winter.

Six other parishes in Oxfordshire.

J. Summer and winter attendance in 33 parishes in Oxfordshire.

58. To show the difference of attendance in summer and winter, take the aggregate attendance of the 33 parishes for which the school returns for Oxfordshire are tabulated, and we have :—

	Boys.		Girls.	
	Under 10.	10 to 13.	Under 10.	10 to 13.
Summer - -	695	127	711	185
Winter - -	699	144	689	185

While, therefore, for boys under 10 there is a very slight increase in winter ; for boys over 10 there is an increase of about 12 per cent.; for girls under 10 there is a decrease in winter of about 3 per cent. (due no doubt to the effect of weather); for girls over 10 the numbers are the same for both summer and winter. These tables also show that there are more than four times ($4\frac{1}{3}$) as many children under 10 as of children between 10 and 13 in average attendance (in Beds and Bucks there were respectively $4\frac{1}{2}$ and 6 times as many).

Some parishes in Woodstock union too small to support an efficient school.

59. It will be observed from school table A. that several of the parishes in Woodstock union are exceedingly small, eight of them containing less than 1,000 acres, and nine of them less than 200 inhabitants. In four of the smaller parishes there are no schools, but the largest of these (Rousham) has only 131 inhabitants, and in no one of the four have the children any difficulty in finding school accommodation in neighbouring parishes within easy distance of their homes.

The evil of these small parishes is, that two poverty-stricken schools are often found competing against each other and doing their work, if not badly, at least not so well as it would be done by one school supported by the funds of both ; nor does a parish of less than 1,000 acres with a complement of 100 or even 200 inhabitants offer a field for employment sufficient to induce an active clergyman to reside amongst his flock, and hence it is that it is from such parishes we hear most of the educational difficulty arising from "the indifference of parents ;" where the clergyman does reside in such a parish and bears, as he often does, a heavy share of the expenses of the school, it cannot be wondered at that he strives to keep his young flock together under a teacher who is probably one of his own people and uncertificated, rather than encourage them to go out of his parish to some more efficient school over which he has no control ; under the present rule for distributing the Government grants he suffers the loss of that aid which larger parishes can afford to purchase, and if the teacher be inefficient (which is, however, not always the case) the children suffer with him.

Schools in Wantage union.

60. Table A. of the Berks summary contains all the schools in Wantage union, for which I received returns in such a form as to enable me to tabulate them, with the exception of a return from Hampstead Norris, which reached me after the evidence was printed; by, however, excluding from this table the return from Blewbury, where large endowments attract children from other parishes not included in the table, and adding the return which I have since received from Hampstead Norris, I can treat the remainder of the returns as representing the whole attendance of children under 13 years of age at all elementary schools in an area of 59,251 acres, containing 13,993 persons, according to the census of 1861, in Wantage union, and the account stands thus: that in a district of Berkshire containing 59,251 acres and 13,993 inhabitants, there are *in average attendance* at some elementary school :—

In summer - - - - - -	483	boys under 10.
	82	„ between 10 and 13.
	473	girls under 10.
	161	„ between 10 and 13.
Total children under 13 - -	1,199	
In winter - - - - - - -	514	boys under 10
	94	„ between 10 and 13.
	455	girls under 10.
	177	„ between 10 and 13.
Total children under 13 - -	1,240	

And that there are *on the register* of the same schools :—

In summer - - -	1,460	children under 13.
In winter - - - -	1,633	„ „

Making the same allowance as I have hitherto done for persons who do not belong to the class for which these returns are made, it would appear that there is one child under 13 years of age *on the register* of some school for every $7\frac{1}{2}$ persons (taking the average of summer and winter), and one *in average attendance* for every nine persons. Of the children under 10 years of age there are about 2 per cent. more boys than girls in average attendance in summer, and about 5 per cent. in winter; whereas of the children between 10 and 13 there are about twice as many girls as boys in average attendance both in summer and winter.

Summer and winter attendance.

61. Comparing the summer and winter attendance, we find that for boys under 10 there is in winter an increase of about 7 per cent.; for boys over 10 an increase of 14 per cent., while for girls under 10 there is a decrease of 4 per cent., and for girls over 10 an increase of 10 per cent.; a similar analysis of the returns from four parishes in Bradfield and Wokingham unions shows a decrease in winter of 7 per cent. for both boys and girls under 10, and no alteration in the attendance of those over 10.

Peculiar shape of parishes

62. I have said that I think the system of education suffers in Woodstock union from the smallness of the parishes ; in Wantage union it suffers, though not nearly to so great an extent as the economy

of farm labour, from the peculiar shape of the parishes which on the northern slope of the downs run up in narrow strips from the vale over the ridge of the downs, those families whom the farmer finds it necessary to locate on the high ground being removed to a considerable distance from the church and school, which are invariably situated in the lower part of the parishes; the same thing occurs again on the slope of the Chiltern hills in Oxfordshire, where Pyrton parish, containing 5,140 acres, is 11 miles in length. As the better understanding of the economy of labour leads to the building of cottages on the higher parts of these parishes, the school difficulty arising from their peculiar shape will be more felt.

J. affect school attendance.

63. Returning for a moment to the comparison between the summer and winter attendance at elementary schools.

Evidence of the extent to which farm labour interferes with education as obtained from school returns.

The slight difference between the summer and winter attendance of boys under 10 at the 33 schools in Oxfordshire for which the returns are tabulated, a difference which is, however, in favour of the winter attendance, shows that a certain, though not very large, number of boys who attend school in winter are prevented, probably by farm labour, such as field-keeping, &c., from attending in summer. The increase in winter of 12 per cent. for boys between 10 and 13 shows that about that per-centage of such boys are only employed in field labour in summer. The decrease of 3 per cent. in the winter attendance of girls under 10 is only the natural decrease resulting from bad weather, which does not affect the attendance of girls over 10 years of age.

Taking the group of schools in Wantage union, the difference of 7 per cent. in favour of the winter attendance of boys under 10 seems to show that at least that per-centage of such boys are prevented by farm labour from attending in summer, and that boys of that age are more frequently employed in farm labour in this union than in Woodstock. The winter increase for boys over 10 is about the same as in Woodstock union and for the same reason; the attendance of girls under 10 is not affected by any labour, and shows a slightly higher decrease in winter on account of the distance which some children have to walk to school. The increase of 10 per cent. in the winter attendance of girls between 10 and 13 is caused I apprehend by girls of that age being employed in the hill parishes as field-keepers, pig-minders, &c.

Agricultural labour, therefore, does not, I think, interfere very seriously with the school attendance of children under 10 years of age, though it does interfere to a certain extent, especially in summer, and that more in Wantage than in Woodstock union. After 10 years of age the effect of the employment in farm labour is that the education of boys of the agricultural labouring class, as far as it is obtained at day schools, practically ceases. Of the 23 parishes in Woodstock union where there are day-schools, the returns of five of these schools show no attendance for boys over 10 years of age, and in 16 of them the attendance of such boys does not exceed two; of the 21 parishes in Wantage union, for which the school returns are tabulated, four show no attendance of boys over 10 years of age, and in 10 of them the attendance of such boys does not exceed two. In Woodstock union, where gloving interferes with the school attendance of girls over 10 years of age, the attendance of girls between 10 and 13 exceeds that of boys by 40 per cent. in summer, and 20 per cent. in winter; in Wantage union, where the attendance of such girls is only disturbed by some summer field work in the hill parishes, the attendance of girls between 10 and 13 exceeds that of boys by about 70 per cent. both in summer and winter.

64. It will not be surprising, then, that the evidence of clergymen given for their respective parishes, as well as that which I myself obtained by examination of many children whom I found at work, shows that a very large proportion of the labourers' children are growing up with an utterly insufficient education; that is to say, that the education obtained by the great majority of them at day schools is of itself quite insufficient to ensure the power of reading and writing in after life.

Corroborated by other evidence.

65. Happily, however, the Sunday and night schools come to the aid of those who can be induced to attend them, or who are within reach of a night school, and in nearly every case where on examination I found that a farm boy of 14 or 15 could read and write, I was told that he had kept up his learning at a Sunday or night school, or both. This, I think, tends to prove two things, 1st, that an education ceasing altogether at 10 years of age is generally insufficient to secure in after life the power of reading and writing; and, 2nd, that granted a regular attendance at day school up to 10, very little, though some, reminder is necessary for the next three or four years to secure these accomplishments; a reminder that many children in Oxfordshire and Berks are obtaining by attending Sunday school throughout the year, and night school for about two nights per week during the four winter months for from 1½ to 2 hours per night.

Night schools and Sunday schools as supplementary to day schools.

In speaking of night schools as supplementary to day schools in my report on Beds and Bucks, I said,—

"I confess that if it was not for the ploughboy I would not second an application for Government aid "to evening schools."

Holding as I do pretty much the same opinions as are thus expressed (see Oxon evidence 106) by the Rev. H. T. Young, who says,—

"I do not advocate the cause of night schools so strongly as some do, because I think they are apt to "lead parents to neglect to send their children to school at what appears to be the most proper time, viz., "when they are two young to work; they look forward to their son getting some education at the night "school when he is earning wages, and can pay for himself, and consequently, to save themselves expense, "they neglect to send him to school, and so the boy gets no education as a boy at the day school, and he "may or he may not get any at the night school as he grows up; the matter will then rest entirely with "himself, and I think it will be found that where one avails himself of the opportunities offered by the "night schools many more do not."

66. The ploughboy is however again the educational difficulty in Oxfordshire and Berks, employed, as he is, throughout the whole year from about 10 years of age in a large part of both counties; he is in fact the obstacle in the way of applying to agricultural labour, educational restrictions, analogous to those of the Printworks Act (the only one of the three Factory Act modes of obtaining school attendance applicable to farm labour); as to insist upon his attending school for, say, four winter months, up

Yearly hiring of ploughboys from 10 years of age the great educational difficulty.

J. to 12 or 13 years of age would be to deprive him of his yearly hiring and the parents of boys over 10 years of age of about 50*s.* a year for each boy between 10 and the age at which the restriction ceased.

It is no doubt true that bigger boys (more fit to do the work) would be employed at higher wages to take the place of the smaller boys and so to a certain extent repay the loss of the younger boys' winter wages; still this relief would not be felt at the time when parents of large young families are in most need of all the help that any member of the family can give.

67. To meet the almost entire loss of education arising from early withdrawal from the day school, and in spite of all such difficulties as want of funds, want of teachers, weariness of the young after work, and indifference of parents (see evidence in answer to circular question

"What do you find to be the chief difficulties in the way of maintaining an efficient evening school?")

About two-thirds of the parishes which have day schools have also night schools.

Night schools have been established in a great majority of the parishes I visited in both counties; 20 of the 30 parishes in Oxfordshire for which I received day school returns have also night schools, and 24 out of the 31 parishes in Berks for which the like returns were made, and the answers given in the shorter circulars which do not involve a school return, show that these proportions are maintained throughout the counties. That is, that about two-thirds of the parishes in Oxfordshire and Berks have night as well as day schools, open usually for from two to three nights per week for the four winter months; in some parishes for four nights per week or more (in Weston-on-the-Green, children under 16 are taught on three nights of the week, and young persons over 16 on the remaining three nights), and that about two-thirds (less those who live at too great a distance from the school) of the hired boys have it in their power to keep up the reading, writing, and ciphering which they may be supposed to have attained at 10 years of age.

No one who has not taught in a night school can appreciate the sacrifice of time and comfort which such institutions entail upon the voluntary teachers, and too much praise cannot be bestowed on those who cheerfully fulfil the weary task; but my wonder at the self-denial of the teacher is not much greater than my wonder at the perseverance of the taught, especially the younger scholars, who after a long day's work, trudge sometimes a couple of miles to a night school, undeterred by weather or the example of idler and older companions.*

Success of night schools indicate increasing desire for education.

68. The success of night schools, of which Mr. Goodlake, chairman of the Faringdon union, says, "*the increasing supply is only in answer to an increasing demand*," shows that the desire for and appreciation of education is rapidly spreading amongst at least the younger members of the agricultural labouring class; and the increase and regularity of attendance of younger children in those parishes in which a thoroughly good school is provided, proves that the old difficulty arising from the "indifference of parents," so often alluded to in the evidence, has been in such parishes in a great measure overcome. A strong example of this is seen in Mr. Walter's school at Bearwood, where an excellent teacher (uncertificated) attracts many children from neighbouring parishes, some walking more than four miles to school, and never absenting themselves without an explanatory letter from their parents, or, as in one case shown to me, a medical certificate. The National school at Wantage also attracts the elder children from two or three vilages round it. These are two examples which occur to me at the moment from among several which I could recall.

Indifference of parents.

The indifference of parents, however, has even in the cases I have named been overcome by great perseverance on the part of the promoters of education, inducements other than educational, such as participation in the benefits of clothing and shoe clubs, being held out as more tangible attractions to the parents than the satisfaction of knowing that their children can read and write,† and there is quite enough indifference left to justify most witnesses, and amongst others Mr. Ruck Kene (see Oxon evidence 91) than whom few men have worked more diligently in the cause of education, to place it in the front rank of educational difficulties.

Cases of schools and necessity for rate, &c.

69. Although there are some very small parishes in Woodstock union which have no school of their own, there are, as far as I know, no children residing in the union who are not within reasonable distance of some parish school, and with the exception of a few families living in the upper part of the peculiarly shaped parishes on the slope of the downs, the same may be said of Wantage union; in fact, judging from the parishes I visited and the evidence I received on the subject, there can be very few children in either Oxfordshire or Berks who are not within a tolerably easy walk of some school. Great progress has evidently been made within the last few years in the supply of schools, and in this respect these counties contrast favourably with those I have already reported upon.

I found, however, the same inequality in the efficiency of the schools and the same unequal pressure on the resources of their supporters. As a rule, a heavy share of the burden of the school falls upon the clergyman, who, if he possibly can, bears it without complaint rather than give any occasion for such State interference as might deprive him of the authority in the management of the school which he now possesses. In a few cases, especially of parishes owned by non-resident landowners, the burden is so great as to drive even the clergyman to ask for some legislative action, which may compel the owners of property to bear a fair share of the expense of supporting the school.

In some cases one resident landowner is obliged to do duty for his absent brethren, even though his pecuniary interest in the parish is much smaller than theirs.

Bampton Aston parish, Oxon.

I beg, for instance, to draw your attention to the state of matters educational in Bampton Aston parish, as described by the Rev. G. S. Griffiths (see Oxon evidence 27). This parish, which has, or had at the last census, 968 inhabitants, contains 3,760 acres, whose rateable value is about 5,000*l.* a year; and the following are the contributions to the National schools given by the chief landowners for some years past:—

St. John's College, Oxford, owns 410 acres, rateable value 991*l.*, has given nothing for 11 years.

A non-resident landowner owns 800 acres, rateable value 1,000*l.*, has given 5*l.* during 11 years.

---

* The Rev. Jas. Fraser, of Ufton, Berks, says:—"Some of the scholars come from a distance of nearly two miles; even this wet season "has hardly diminished the attendance at all."

† I am not aware whether this has been the case with the Bearwood school, but it is a very usual expedient.

A non-resident landowner owns 1,869 acres, rateable value 2,531*l.*, has given nothing for many years. J.

A non-resident landowner owns 356 acres, rateable value 506*l.*, has given nothing for many years.

From Mr. Griffiths' account there appears to be about 14*l.* a year from charity funds and available for educational purposes.

Steventon parish, Berks.

As another example of what an absent or peculiar proprietorship sometimes entails on the clergyman, take Steventon parish, in Berks, of which the Dean and Chapter of Westminster are lords of the manor, the property being, I believe, now in the hands of the Ecclesiastical Commissioners. An excellent school was erected in 1864, which with its surroundings cost 1,066*l.* 8*s.*; towards this sum the Dean and Chapter of Westminster gave 100*l.*, and the vicar 433*l.*, the other subscriptions chiefly from individuals resident in the parish amounted to 130*l.* 10*s.*, and the rest of the money was supplied by sale of old school, Government grant, &c. (see Berks evidence 46a). In fact, the vicar gave twice as much as the absent landowners and all the other residents in the parish put together. This parish has about 900 inhabitants, and contains about 2,400 acres of rich land.

Childrey parish, Berks.

In Berks evidence 10b and 10c will be found an account of an educational difficulty of a different character. I cannot, however, do more than give a sketch of the state of matters when I visited the parish of Childrey in January last:—

I found then three schools or school systems in existence: a Wesleyan mixed school, supported by an endowment, as far as I could learn, of about 20*l.* a year; a church school for girls, supported by subscription and under charge of the rector, and an endowed school *for boys*, towards which the Provost and Fellows of Queen's College, Oxford, pay 50*l.* a year, and provide a house for the master, in discharge of the condition on which they hold valuable estates in Letcombe Bassett, and other neighbouring parishes.

The Wesleyan school and Church school for girls were closed for Christmas holidays at the time of my visit, January 13, and the teacher of the Wesleyan school was absent, but I was informed that she had had about 25 children (boys and girls) before Christmas, and that about 25 girls attended Dr. Whittingham's school. The endowed school for boys had been closed for two months, and at the time of closing there were only three boys in attendance. According to the evidence of the rector there were about 25 boys, who would have been in attendance at the endowed school but for a misunderstanding between the master and the parents, neither at school nor at work; and within the last few days I have received a circular which I left in charge of the master of the endowed school from which it appears that there are still 14 boys between 8 and 10 years of age neither at school nor at work, besides boys over 10, of whom no account is given. As to the state of education in the parish, the circular says, "The majority of the parishioners are unable to "read or write;" the result is that in a parish with an ample endowment to fulfil all the educational requirements not only of its own inhabitants but of the elder children of surrounding parishes, for the male portion of whom the endowment, I think, there can be little doubt was intended, shows less educational fruit than any parish which I visited in Berks, and that chiefly, if not entirely, from the want of Government inspection. As will be seen in the evidence, the endowment was made in the year 1526, when perhaps the education of girls was considered a matter of little importance, but I think the girls might now very properly share its advantages with the boys.

Boards of Guardians and the Factory Act.

70. Passing now to the evidence which I received on the desirability or necessity for restrictions in the employment of children in farm labour for the sake of education, and the form which such restrictions, if desirable, should take, I may state first the result of the interviews which I had with 11 of the boards of guardians representing as many unions situated in the two counties, taking afterwards the opinions which I received from individual witnesses on the same subject.

Resolutions of the Woodstock board:—

"In the opinion of this board it is not customary in this union, nor is it to the advantage of the employer or the employed, that children under 10 years of age should be employed in field labour, except during the period of the harvest of hay and corn.

"Legislative interference, with a view to the restraint of such employment, is not desirable.

"It is desirable that the State should afford increased assistance towards the education (not compulsory) of children under 10 years of age, but not of children of a more advanced age."

The Witney board (13 guardians being present) resolved unanimously,—

"That the board of guardians of the Witney union is of opinion that the Factory Acts should be applied to this union so far as that children shall not be employed under 10 years of age."

The Banbury board resolved,—

"That in the opinion of this board legislative interference is not required in the education of children employed in agriculture."

This resolution was carried by 10 votes to 6 against an amendment that children under 10 should not be employed unless they can read and write fairly, in which case they should be allowed to work at 9.

The Bicester board (14 guardians being present) resolved unanimously,—

"That the board of guardians of the Bicester union is of opinion that the principles of the Factory Acts should be applied to this union, so far as that children shall not be employed under 10 years of age unless it can be shown that a child is physically able and can pass a certain school examination, *i.e.*, read and write fairly, in which case it may be allowed to work at 9 years of age."

At a meeting of the Henley board a motion in favour of restricting farm labour to children over 10 years of age was defeated.*

* (The Assistant Commissioner was present by appointment at the meeting of the board held on the 10th, but notice of his visit not having been sent to each of the guardians, the discussion was postponed till the 17th, when the Assistant Commissioner was not present.—G. C.)

J.

The Wantage board resolved that,—

"It is the opinion of the guardians that inasmuch as children under 10 years of age in agriculture are only employed during the summer in this union, no legislative interference is necessary to regulate the employment of children in agriculture."*

The Faringdon board resolved unanimously,—

"That it is the opinion of this board that children under 10 years of age ought not to be employed in agricultural labour."†

The Abingdon board resolved that,—

"Legislative interference with the employment of children in farm labour is not, as far as this union is concerned, desirable."‡

The Bradfield board resolved unanimously,—

"That no child ought to be employed in agricultural labour under the age of 10 years, unless such child could produce a certificate of being able to read with facility."§

The Newbury board resolved,—

"That is is not desirable to place any legislative restrictions on the employment of boys in agriculture."‖

The Hungerford board (18 guardians being present) resolved,—

1st. "That, taking into consideration the demand for labour in this union and neighbourhood, and the pecuniary resources of the agricultural labourers, this board recommends that some restriction should be placed upon the age at which boys should be permitted to be employed in farm labour."

2nd. "That the restriction should be, that no boy under the age of 10 years should be so employed, except in the case of any boy of 9 years of age who can produce a certificate of his ability to read, write and cipher."

The first resolution was carried unanimously, the second by nine votes to eight as against an amendment that boys should be allowed to work at 9.¶

The following is one of the resolutions carried at a meeting of the Newbury Farmers' Club after discussing the provisions of Mr. Forster's Education of the Poor Bill.

"That no boy should be employed in farming operations before the age of 9, unless he had previously earned to read."

Opinions of individual witnesses on application of Factory Act principles.

71. Taking now the opinions of individual witnesses on the advisability of legislative restrictions on the employment of children in farm labour for the sake of education, it will be seen from the evidence, especially from the answers to the longer circular question (22m), and shorter circular question (6), that a majority of witnesses are in favour of some restriction, and that of those who are so, the greater number are of opinion that all legislative interference should cease at 10 years of age, though several witnesses, and among them a considerable proportion of occupiers of land, are in favour of carrying the restriction up to 12 years of age.

Suggestions as to coupling educational with age test, by Mr. G. C. Cherry.

72. There is, however, amongst those who are most anxious to promote the education of the labouring class, a decided leaning to couple an educational with an age test, by way of lightening the pressure on the parents of large young families, and at the same time of holding out an inducement to careless parents to send their children to school. I don't know that the general feeling on this subject is anywhere better expressed than by Mr. G. C. Cherry, Chairman of the Hungerford union, and Vice-Chairman of the Berks Quarter Sessions, who in his answer to the shorter circular question (6), says,—

"I think it desirable to prevent boys from working at an earlier age than 10 years. Such a rule will in many cases cause great difficulties, *e.g.*, where there are large families, it may be of five, six, or more children under that age. It is not easy to say how, at the present rate of wages, a man can support such a family, no one of the children contributing to the family purse. Nevertheless, I think the rule desirable, with the view of securing some education. Perhaps exceptions to it might be permitted in cases of boys proved to have reached a certain standard of education."

---

* The following are extracts from my notes taken at the meeting of the Wantage board:—"It was stated by the Chairman that one "effect of the Union Chargeability Act is that farmers instead of employing men whom they do not much want in winter, as formerly, "now let them go to the union, not caring to save the general fund as they did their own parish. The board decided against the "desirability of legislative interference for the sake of education on the ground that the facilities for obtaining education are all that "can be desired, and that children under 10 years of age are very little employed. It was generally agreed that the earning of so "much money in summer and so little in winter is a cause of mischief to the labourers, whose habits are very improvident."

† The following are extracts from my notes taken at the meeting of the Faringdon board:—"Great stress was laid by many "guardians on the desirability of encouraging night schools, and on the growing desire for education evinced by the success of night "schools in Faringdon union. A landowner, who has had considerable experience in the working of the Factory Acts, spoke very "strongly of the benefits which had been conferred by them on the children employed in large factories."

‡ The following is extracted from my notes taken at the meeting of the Abingdon board:—"The above resolution was carried by a "majority of 10 to 6 as against a resolution in favour of restricting farm labour to children (*i.e.*, boys, as girls are not so employed), "to those over 10 years of age. The chief objection to such legislative interference was that where families are large, and consist of "children all or nearly all under 10 years of age, an injurious pressure would be put upon the parents by such a restriction: it "was urged also that a restriction as to age unaccompanied by compulsory attendance at school, would only add to the number of "idlers."

§ The following is a note taken by me at the meeting of the Bradfield board:—"Several guardians complained of the difficulty of "getting ploughboys, which would be increased by any further interference than that suggested in the resolution. It was stated at the "same time that there was no lack of adult labourers."

‖ The following is from my notes taken at the meeting of the Newbury board:—"The above resolution was carried after a fair "discussion, from which some occupiers appeared to be opposed altogether to the education of farm labourers, while others only "deprecated legislative interference, on the ground that it would put an unnecessary pressure on the parents of large young families, and "would fail of doing any good unless school attendance was at the same time made compulsory. It was stated that schools now attracted "many children by inducements other than the offer of education, such as shoe and clothing clubs. The fear of an educational rate "was also frequently dwelt upon. Upon the whole the feeling of the board was in favour of a further advance in education, "but objected to a resolution in favour of a somewhat extended interference, proposed by a member of the board, who is also a "clergyman."

¶ The following is from my notes taken at the Hungerford board:—"The Hungerford union maintains the children of widows "receiving relief until the boys are 10 and girls 11 years of age, unless any boy or girl under these ages is actually earning wages, and "there was no instance on the books on the day of the Assistant Commissioner's visit of a boy under 10 earning wages. The chairman "(Mr. G. C. Cherry), in moving a resolution in favour of legislative interference for the sake of education, said, 'I have for a long "'time seen that we should have to provide against a short supply of labour; the farm work is now practically left to boys and old men, "'the younger men go elsewhere to seek labour at higher wages. . . . . The rate of wages we can only leave to regulate itself "'according to the ordinary principles of supply and demand; but in order to check this exodus of able-bodied labourers we may as "'landowners offer the inducement of better cottages. Nothing will check the desire to leave the district more than a provision of "'better houses than exist in many of our parishes.'"

Again the Rev. W. J. Dry, Chairman of the Bicester union, says,— J. Rev. W. J. Dry.

"I would restrict the age to 10, but as it often happens that a boy of 9 is physically stronger than one of 10, I would allow a boy of 9 to go to work if he could read and write fairly."

And again the following is the opinion given to me by the Bishop of Oxford, on the application of the Factory Acts principle to children employed in farm labour :— The Bishop of Oxford.

"I think that, if the Factory Act principle is to be applied to farm labour, a child should be allowed to work half time at 8, whole time at 9 (if it can produce a certificate that it can read and write well), and whole time at 10 under any circumstances. Such a modification of the principle of the Act would quicken the sense of parental responsibility, and tend less than merely fixing an age (such as 10 years) under which no child should work to make parents depend on State aid, and would cause less necessity for an educational rate, which, I think, would at once stop voluntary aid, and put an end to religious teaching in our schools.'

You will observe how closely these opinions, in the order I have given them, are followed by the resolutions of the Hungerford, Bicester, and Bradford boards of guardians.

73. In a letter addressed to me, at my request, by Sir Henry Dashwood (see Oxon evidence 93c), on the subject of primary education, he says,— Suggestions on educational schemes by Sir H. Dashwood, Bart.,

"The present state of voluntary education is not satisfactory. The maintenance of a school (if there is one) falls upon the clergyman or principal resident, not necessarily on the proprietor, and if none of these persons choose to undertake the responsibility of maintaining a school, the labouring population must remain untaught. When clergyman and proprietor undertake the entire management of a school, it is seldom they are able to enlist any assistance in the management and supervision, even from the parents. Under a rating system it may be presumed that all classes being interested, they will watch over the management, and endeavour to obtain good results for their money. The more persons who can be interested in the supervision the better, as then errors of management or misconduct of the teachers could not long continue without being discovered.

Sir Henry then goes on to suggest,—

"1st. That good primary schools for children up to 12 years of age should be established throughout the kingdom, the expenses to be met by rate (as before suggested, half from owner and half by occupier). 2nd. By payments from the children. 3rd. By assistance from Government. If the school passed the requirements of the Government inspector, who should examine at least twice a year, a grant should be made from the Consolidated Fund of one-third of the expenses. Existing endowments might go toward assisting the education of the older pupils, night schools, &c. The area for each school and general management of extra endowments might be controlled by a district board, perhaps the board of guardians might undertake these duties. As Government would contribute to the maintenance of the schools, they would also have a voice through their inspectors.

This is in the main the same scheme as was recommended by Mr. Jas. Howard, now M.P. for Bedford, in a letter which I inserted in the appendix to my report on Bedfordshire (see Beds evidence 138). Mr. Howard says,— by Mr. Jas. Howard, M.P.,

"That the local boards (educational boards) should be required and empowered to provide proper and adequate school accommodation in parishes and places *where such does not exist;* that such schools should be subsidized partly from the National treasury, and partly from local taxation, the local tax to be paid jointly by the owner and occupier."

There is between the schemes suggested by Sir Henry Dashwood not only the common feature of an educational rate, but of a rate paid in equal proportions by the owner and occupier; this half rating system for educational purposes is only part of a general scheme for dividing all rates between the owners and occupiers, upon which an excellent paper was read only the other day by Captain Dashwood, at a meeting of the Central Farmers' Club. In this paper Captain Dashwood contends that rates should be levied on all classes, thereby bringing the whole intelligence and instinct of the community to aid in a better administration of the funds; on the subject of education he says,—

"Any one who has watched for several years the working of our present system in country parishes, must admit that it is most faulty and unsuccessful, as it really depends generally on either the clergyman or the chief landowner, and a system thus depending on one person must often fail, as all classes neither take interest nor share responsibility. How this may be avoided is stated in the paper read, namely, that by the half-rating plan all classes would be paying directly towards the rate, and consequently take an interest in its management; the present system being on a basis that does not enlist the interest of all classes, cannot really be improved." by Capt. Dashwood,

My review of the evidence on education has already gone to such a length that I cannot do more than call your attention to the very interesting notes on the different proposed schemes for a national system of education, contributed by the Rev. C. E. Ruck Keene (see Oxon evidence 91); indeed I could not do justice to these notes without quoting them from end to end. There are, however, features common to Mr. Keene's criticisms on all the schemes which he discusses, viz., that there should be a certain amount of State control, and therefore of State aid, and that any scheme which altogether set aside the voluntary principle would be mischievous. It appears to me that although Mr. Keene appreciates all the weaknesses of the voluntary and denominational system, he is unable to satisfy himself that any other proposed plan would allow so near an approach to a self-supporting system; this is in fact the same feeling which induces the advocates of the half-rating system to extend the payment of rates to all classes. by the Rev. C. E. Ruck Keene.

74. All the evidence which I have received from these counties on the subject of education leads me to the conclusion that children might, without in any way interfering with the cultivation of the land or putting any improper and therefore pauperising pressure on the parent, be prevented from being employed in farm labour up to 10 years of age, unless they could produce a certificate of their ability to read and write fairly, in which case they might be allowed to go to work at 9, and that between 10 and 13 years of age, or between 9 and 13 in the case of those children who obtained a certificate entitling them to work at 9, there should either be a yearly renewal of the certificate of ability to read and write, or the proof of a certain number of hours school attendance during the preceding 12 months as a condition of hiring, the number of hours being so limited as to enable the child to fulfil the Summary of evidence on the subject of education.

J.

condition by attendance at day or night school during the four winter months. If such restrictions did in any degree tend to check the employment of boys from 10 to 12 years of age as team boys, during the winter months, I cannot help thinking that the mental and physical advantages far outweigh the evil of such pressure. If the education of the labouring class is to be advanced some pressure is necessary, and the evidence leads me to believe that the restrictions I have named are the mildest form which such pressure could take, to be of any use.

Educational rate where required should be levied on *owners* of property.

75. With regard to the means of providing efficient schools I think an educational rate should be enforced in all parishes where a Government inspector reports that the schools are not adequately supported, or where any fixed proportion of the ratepayers asks for such a rate, failing, however, a revision of the whole system of rating, and the adoption of such a half-rating scheme as I have before alluded to, I think the educational rate should be levied on the *owners* of property. Where landowners are now doing their duty by aiding in the education of the labouring class, they are already paying all that is asked for by such a rate, and many of them are paying not only their own share but that of those whom the voluntary system cannot arouse; an educational rate, therefore, levied on the owners of property would be an actual relief to the best supporters of the voluntary system and would leave the management of the schools in the same hands which now hold it. As I think I have said before the adoption of an educational rate would probably lead to a grouping of small parishes or an arrangement of school districts not strictly confined by parish boundaries, but this need only be done where it is evident that a parish is too small to support an efficient school, or where its shape is such as to prevent any of the children residing in it being within a reasonable distance of their own parish school.

By levying the rate upon the owners of property you at once get rid of the very reasonable objection of the occupiers of land to an educational rate, which, although theoretically and ultimately a tax on the land, practically means a rise of rent to them which they would never have had inflicted on them, but for the sake of education of the benefits of which they are by no means generally convinced. I must do the farmers of Oxfordshire and Berks the justice to say that but on the score of an educational rate levied on them I scarcely ever heard from them any illiberal sentiment on the question of educating the labouring class, and on the rating question I think they are perfectly right.

Cottages.

76. The Answers to Questions 37 and 9 of the different circulars giving a general description of the cottages will be found at the beginning of the parish evidence, Nos. 1 to 64, Appendix B. of Oxon evidence, and Nos. 1 to 65, Appendix B. of Berks evidence, and in Appendix A. for each county I have given a summary of these answers, which for Oxfordshire is as follows :—

General description of their condition.

"The cottages are described in a nearly equal number of cases as '*good or fair*' and '*bad.*' Rooms are "generally described as small, and in most cases the accommodation is described as insufficient for the larger "families."

"Ventilation is generally described as *fair;* in seven cases it is described as *bad.*"

"Drainage is usually described as *bad;* in five cases it is said to be *good.*"

"Water supply is generally said to be *good;* in six cases it is said to be *bad.*"

The summary for 58 descriptions for Berks stands thus :—

"The cottages are described as good in eight cases, as fair in 10 cases, as *mixed good and bad* in 10 cases, as "*bad* in 12 cases."

"Ventilation is described about equally often as *good* and *bad.*"

'Drainage is described in the majority of cases as *bad.*"

"Water supply is said to be *good* in 23 parishes, *fair* in six parishes, *bad* in 11 parishes."

"Outhouses are seldom mentioned; in four parishes, they are said to be insufficient and badly placed."

No instance is mentioned in either county of the owner compelling the occupier to deal with him.

Rents are highest in the small towns, such as Woodstock, Deddington, Witney, Wantage, and in the large open villages, which supply labour to surrounding close parishes; in these towns and open villages the cottages usually belong to speculators or small tenement holders, and rents vary from 1*s.* to 2*s.* 6*d.* a week for a cottage without a garden, and in the small towns and open villages the worst specimens of cottages are to be found.

In all the close parishes, and in some of those which can hardly be called close, the cottage property lies with the landowners, and is generally of a very much better character than in the open parishes. In some of the close parishes which I visited, the cottages are all that could be desired in quality, but deficient in quantity.

Except in Burghfield and Finchampstead I saw no great number of squatters' cottages; in Burghfield I should think at least two-thirds of the working population live in cottages or huts of their own building; some of them miserable hovels (see Berks evidence 51a, where also it will be seen that an occupier of 500 acres told me he had offered his landlord 7 per cent. on the outlay if he would build him some cottages attached to his farm offices).

The landowners' cottages are, as a rule, in fair condition, and have usually a garden attached to the cottage, cottage and garden being let at a low or moderate rent, varying from 9*d.* to 1*s.* 6*d.* a week.

Woodstock union.

77. In the parish evidence from Woodstock union (see Oxon evidence Nos. 1 to 25) I have given the number of cottages belonging to the landowners in each parish, and a few examples will serve to show not only how many cottages the landowners provide, but also how that provision affects the comfort of the labourers (the acreage stated as *let in farms* is taken from the union valuation list and includes land occupied by the owner, but is exclusive of woods, allotment ground, &c.).

Taking first, examples of close parishes. My note on Glympton, pop. 153, acreage 1,232, is,—

The chief landowner has 22 cottages for about 950 acres of farm land. Magdalen College, Oxford, has 70 acres, and the glebe 55 acres, without any cottage, and as there is no other cottage proprietor, there are therefore not cottages enough to supply the labour of the parish; those which there are are well cared for, as well as the persons living in them, by the chief landowner, who charges a small rent (30*s.* a year), and supplies allotment ground at the rate of 3*s.* a chain (30*s.* an acre), the usual allowance to a family being two chains.

On Kiddington, pop. 205, acreage 2,450, my note is,—

All the cottages, of which about 36 are inhabited by labourers, belong to the chief landowner, who has

about 1,500 acres let in farms. There are therefore not sufficient cottages to supply the labour of the parish. The rectory farm has no cottage. 11½ acres are let in allotments, and the cottages are well looked after by their owner.

On Rousham, pop. 131, acreage 920, my note is,—

There are 25 cottages for 920 acres, not sufficient to supply the labour of the parish. All the cottages are good and well cared for.

Taking now as many examples of open or quasi open parishes.

On Steeple Barton, pop. 850, acreage 2,832, my note is,—

In this parish there are about 150 cottages let at rents varying from 30*s.* to 80*s.* a year; many of them very bad. These cottages belong to about 40 different persons, many of them small tradesmen. The chief landed estate, having about 1,300 acres let in farms, appears to be represented by 10 cottages, and another estate of about 500 acres has apparently no cottages belonging to it. With the exception of one landowner, who for about 120 acres has seven cottages, and lets 11½ acres in allotments, and the 10 cottages named above, the landowners in this parish leave the necessary supply of cottages to private or speculative enterprise. In Steeple Barton there are 10 very poor cottages with one bedroom each, and one room down stairs. One of these cottages is inhabited by nine persons, two by eight persons each, and the remaining five by five persons each.

On Deddington, pop. 2,024, acreage 3,990, my note is,—

Deddington with its hamlets is an open parish into which labourers have been driven from surrounding close parishes; there are about 240 cottages belonging to about 50 owners, the three largest estates approaching 300 acres each not being represented by any cottages. Several of the cottages in Deddington proper are very bad; in Grove Lane, commonly called Hell Lane, are seven or eight houses with no back door, a sink in front of the cottages, and one watercloset for the lot; the whole place has a horrid stench. Rent of these cottages, 1*s.* 2*d.* a week; they belong to small tenement holders. The inspector of nuisances certainly does not do his duty.

On Wootton, pop. 1,238, acreage 3,720, my note is,—

This is a large open parish with many very poor cottages, both in the village of Wootton and in Old Woodstock. A very small proportion of the cottages belong to the landowners. The largest estate has seven cottages for 1,570 acres let in farms; the rector has 10 for about 750 acres; another proprietor has two for 540 acres; and another has 400 acres without a cottage. Balliol College has one cottage for 320 acres; the churchwardens have 15 cottages.

Dunstew is an unique example (as far as this union is concerned) of a close parish sufficiently supplied with cottages, the chief landowner having sufficient cottages not only for his own estate but for the church land, which for 180 acres has no cottage.

The unequal distribution of landowners' cottages is exemplified in Yarnton, where one landowner, owning half the parish, has 30 out of the 50 cottages, the other landowners having none.

Tackley also is a good example of this, in which one estate of 600 acres has 26 cottages, while another of the same acreage has no cottage; in the same parish an estate of 500 acres has 15 cottages, while another of 400 acres has none; Christ Church College also has 350 acres without a cottage.

The largest estate in Woodstock union has, as nearly as I could ascertain, 180 cottages for about 8,400 acres, and the next in size has 114 cottages for about 3,800 acres, the former having rather more than two, and the latter exactly three to 100 acres.

In the open villages, such as Deddington, Wotton, Woolvercott, and the two Bartons there are some miserable dwellings.

Of Cassington, which did not strike me as having any unusually bad cottages, the Rev. C. Reade says,—

"The cottages vary; some are tumbledown and little better than piggeries; landlords of such abominations ought to be fined."

The worst close parish in Woodstock union, as far as cottages are concerned, is Shipton, but as this parish has very recently changed hands the state of matters cannot be charged to the present landowner.

78. Of the parishes which I visited in Oxfordshire, other than those in Woodstock union, the cottages and their surroundings are best cared for in Stanton Harcourt, Kirtlington, Nuneham, Shirburn, and Swyncombe, all of them close parishes and lying under the eye of a resident landowner. Other parishes in Oxfordshire.

The worst specimen of landowners' cottages which I saw were in Marsh Baldon and Enstone.

I don't think I visited any open village in which there were not some very bad cottages, but upon the whole the open villages in Oxfordshire, and I may add Berks, do not present such unwholesome pictures (water excepted) as some of those which I can call to mind in Bedfordshire and Bucks.

79. The following list will give an idea of the proportion of cottages which are supplied by landowners in Wantage union:— Wantage Union proportion of landowners' cottages.

1.	An estate of	12,000	acres has	216	cottages, less than 2 to 100 acres.
2.	„	7,900	„	215	„ less than 3 to 100 acres.
3.	„	2,260	„	43	„ about 2 to 100 acres.
4.	„	1,700	„	41	„ about 2½ to 100 acres.
5.	„	1,450	„	22	„ about 1½ to 100 acres.
6.	„	660	„	No cottage.	
7.	„	630	„	10	cottages, about 1⅔ to 100 acres.
8.	„	570	„	2	„

I cannot give the cottages on College property which is held on beneficial leases, as they appear in the valuation list under the names of the leaseholders; on the college property which is let in the ordinary way the case stands thus:—

Queen's College - -	Oxford	has 1,000 acres	and 11 cottages.
Corpus Christi College	„	has 470 „	and 14 „
Worcester College -	„	has 270 „	and 9 „

J.

On all of these estates three cottages per 100 acres would, if fairly placed, be sufficient to supply the necessary labour; it will be seen that of the larger estates, No. 2 is the only one which closely approaches this proportion, making no deduction for cottages held by persons other than agricultural labourers; this deduction, however, is a very serious one under the village system, *i.e.*, where cottages are not attached to farms and held for the use of the labourers employed on them.

A landowner cannot, or at all events does not, turn a family out of a cottage because the agricultural working power of the cottage is lost to his estate, and so the cottages come to have only an accidental connexion with the farms of their landlord, and it by no means follows that, in a district where three cottages would, if inhabited by able-bodied farm labourers and their families, be sufficient for the supply of labour, an estate which, like No. 2, can show a proportion of 3 to 100 acres, is able to house all its labourers.

Judging from the evidence, I have obtained on the subject, where labourers' cottages are built in villages and are held directly from the landlord, about one-fourth may be deducted in computing the proportion available for the cultivation of the land, allowing one adult male labourer for each cottage.

What I have said above of the proportion of cottages belonging to the landowners in Woodstock and Wantage unions may, I think, be taken as a fair sample of the two counties, and shows how far the landowners are from fulfilling the condition of providing cottage accommodation sufficient for the labour required on their estates, making no such deduction as, I think, should be made where the cottages are not attached to the farms, as is the case in these counties.*

Other cottage evidence from Berks.

80. Of the parishes *which I visited* in Berks the cottages are good and provided with all necessary conveniences in Ardington, West Challow, Farnborough, Lockinge, Buckland, Coleshill, Pusey, Englefield, Sulhampstead, Shaw, and Bearwood.

In all of them the cottages belong to the landowners, and except in West Challow and Farnborough, are immediately under the eye of the owner. Farnborough is not far from the residence of the owner and belongs to an estate which is better supplied with cottages than any other in the union of Wantage. West Challow presents a case where an absent landowner attends to the home comfort of his labouring tenant. In this village the cottages are old, but roomy and comfortable, and are particulary well kept by the inhabitants, showing a very marked contrast, both inside and out, to the cottages in the neighbouring open village of East Challow, though the same active pastoral care is constantly at work in both parishes.

Again, of the parishes I visited in Berks, I saw the largest proportion of bad cottages in East Challow, Childrey, Hanney, East and West Hendred, Sparsholt, Charlton and Grove hamlets of Wantage, Steventon, and Burghfield. As in Oxfordshire, however, I never visited any open or quasi open parish without seeing a certain number of very poor dwellings.

Except in not providing cottages sufficient for the labour of their estates, the landowners are not responsible for the state of the cottages in any of these parishes, except in East Hendred and Sparsholt. In East Hendred, while the chief landowner has (I think) upwards of 40 cottages with which I have no fault to find, another landowner possesses, besides better cottages, eight of the worst specimens in the village; eight cottages, in fact, quite unfit to be inhabited. On the whole, there are 35 cottages (see Berks evidence 17c) in East Hendred which have but one bedroom; in one of these there are 10 occupants, in three others there are nine, in three others there are eight; 20 of these 35 one-bedroomed cottages are in very bad condition and still find tenants at 52*s.* a year. In this village where "local congestion" developes itself there were 26 men out of work when I visited the parish.

In Sparsholt several of the worst cottages I visited belong to a non-resident landlord.

In Berks evidence 46 will be found a description of 11 thatched cottages standing by the side of the brook near the railway station at Steventon, anything more unfit inside or out for human habitation it would be difficult to conceive. This (Steventon) is one of the few remaining unenclosed parishes (the Dean and Chapter of Westminster are lords of the manor, and the property is now, I believe, in the hands of the Ecclesiastical Commissioners), and is an example of the effect of beneficial leases and limited interest in land; like several villages lying below the northern slope of the down it is badly supplied with spring water, and very much too well supplied with dirty ditch water; in fact, as I say in my notes, if there is not always typhoid fever in the village it is not from want of a standing invitation.

Grove, near Wantage, is another example of an absence of wells, where the cottages have no other water than the brook which has just received the sewage of Wantage.

The squatters' cottages or huts in Burghfield are described in Berks evidence 51*a*. The best are but poor dwellings, and the worst are wonderful to look upon as representing human homes, and yet the squatter would rather live in his narrow hovel with a living room at one end and tiny bedroom at the other, paying a quit rent of 4*s.* 6*d.* or 8*s.* 6*d.* a year, according as he has 20 or 80 poles of very poor land, than pay 50*s.* a year for a decent cottage and 20 poles of garden, giving as far as he can a proof of the fallacy of the assertion so often made that cottage rents and therefore good cottages are only a question of wages.

Good cottages not altogether a question of wages or rent.

81. It is said, for instance, that when a labourer has only 12*s.* a week and cannot afford to pay more than 1*s.* a week rent, he would be as well off in every other respect and be able to pay 3*s.* a week rent and so command a three bed-roomed cottage, if his wage was raised to 14*s.* a week, and so far what is said is true, but would he do it? Would he be content to be only as well off as he was before? Does he do it now in the exceptional cases where labourers receive 18*s.* a week? I would go much further than this and say, that if you could raise the farm labourer's wage to 20*s.* a week, you will still find him living in a cheap house with six children in one bedroom, rather than pay such a rent as would induce a speculator to build a really good three bed-roomed cottage of any ordinary material.

The ordinary cost of a stone or brick cottage containing three moderate sized bedrooms with suitable offices is about 140*l.* When will a labourer deem that his wages are high enough to allow him to pay such a rent as would induce a speculator to build cottages at such a cost?

* In his address to tenant farmers and occupiers (see Berks evidence 89), Mr. H. R. Eyre says:—"In a return which I have of the "number of cottages in the Newbury union, it appears that of 2,155 cottages in the rural districts, 622 only are the property of the "landowners; and as many of these 622 are occupied by gamekeepers, gardeners, and other servants of the landowners, the proportion "of those occupied by the agricultural labourers is proportionately reduced."

J.

There is, however, a fashion in cottage rents as in many other things, and the labourer has in most districts been educated to think that he may fairly be expected to pay 1*s.* 6*d.* or as in some places 2*s.* a week for the rent of his cottage, and if any plan can be matured for building good cottages for which such a rent would be a fair interest on outlay a great advance will have been made to meet the crying evil of overcrowded cottages.

It is the difficulty of such a solution that has induced me to endeavour to point out that the rent of the cottages is not the only interest which a landowner receives from housing his labourers well, and that good cottages conveniently placed for the use of his farms are as necessary as good farm offices of any other kind, and pay fully as well.

This view of the case, as you are aware from Mr. Henley's report, has been practically accepted in the north of England, where a sufficient number of cottages for the ordinary staff of the farm are always attached to the farm offices and let with the farms, and as you have also seen by Mr. Henley's report the custom exhibits no signs of that oppression on the part of the masters to which it is supposed to give rise.

I gave you some instances of landowners in Beds and Bucks who are now attaching a certain number of cottages to their farms, and I find that the custom is spreading in both Oxfordshire and Berks, and that the farmers are quite alive to its advantages, having offered in several cases to pay 5 per cent. interest on the necessary outlay.

Comparatively few farmers, however, are aware to what an extent their labour could be economised, with no loss to the labourer, and their system of employment improved by having the whole ordinary staff of the farm near their premises, and their demand is generally limited to sufficient cottages for the men whom they now put in charge of live stock;* but if they are ever to dismiss their ploughboys, and adopt plough-reins attached to a better class of horses, they should adopt also the Scotch hours so strongly recommended to them by Mr. Read in his prize essay, and the Scotch custom of giving each ploughman charge of the pair of horses he works with, neither of which can with any comfort be done till all the ploughmen are housed on or near the premises.†

82. To persuade landowners that no harm will arise to the labourers from adopting the system, and farmers that it is well worth their while to aid their landlords by paying a fair interest on habitable cottages attached to their farms, is unhappily not enough to ensure a provision of good cottages for agricultural labourers, and there constantly arises to me, and I doubt not to my colleagues, the feeling that in speaking of the state of cottages I am exhibiting a dark picture, as if it was the fault of a class many of whom are powerless to change it, and few of whom are answerable for it.

How far landowners are answerable for the manner in which labourers are generally housed.

We are calling upon the landowners of to-day to remedy the evil growth of many past generations and nine-tenths of those who reside in the four counties which I have visited under your orders are already busy at the work as far as their means will allow.

I could point out to you two very large estates in the counties which I have visited, upon the general improvement of which, cottages having a large share, the whole income has been spent for many years past, and will probably, if the present owners live, be spent for many years to come. What can a landowner do more? How many landowners are in a position to do as much? And above all what must have been the condition of these estates to demand such a sacrifice from the present owners?

What then has led to the state of labourers' dwellings being such as to justify men in speaking of it as a national disgrace? And why are so many landowners now powerless to deal with it?

If I was to answer these questions, judging from the history of the estates I know, I would answer at once, the encouragement given by law to the creation of limited interests in land and the power of entailing burdened estates.‡

What can the poor life-renter, especially if his estate be burdened, do towards providing good cottages for his labourers? Nine times out of ten he strives to do his duty and suffers fully as much as the ill-housed labourers on his estate.

The unhappy propensity to create limited interest and entail burdened estates tells hardest against the smaller properties, where, if the owner lives as all the world expects him to live, there is no margin

---

* Mr. W. Chamberlin, owner and occupier, Adderbury, says:—"I let six cottages with one farm; three of them attached to the farm. "A farm of 500 or 600 acres ought to have five or six cottages attached to it."

Mr. Thos. Taylor, occupier, Shipton, says:—"The majority of labourers live in the village, about a mile from my premises, but this "was such a constant source of annoyance and inconvenience that I have erected three large cottages (for carters and shepherd) near the "farm buildings at a cost of over 500*l.*"

[Mr. Taylor holds his farm on a lease for 20 years. One of the cottages is a sort of lodging house for unmarried carters, looked after by the head carter's wife, who lives in adjoining cottage.—G. C.]

† Mr. John Hedley, bailiff to Mr. Wroughton, of Woolley park, near Wantage, says:—"A ploughman cannot take charge of his two "horses unless he lives on the farm premises. Farmers here are obliged to hand over seven or eight horses to one man's care as soon as "work is over."

The following is extracted from a letter from Mr. James Sanderson, land surveyor and valuer:—"Apart from the important questions "of education, cottage accommodation, and wages, it must be admitted that the great distance between the cottage of a labourer "and his work, and the prevailing mode of contract, especially in the southern counties of England, between farmers and employed "married servants, adversely influence the moral and social condition of the labourer. . . . . .

"In the majority of the Scottish counties, as well as in the northern counties of England, there are attached to each farm, and placed "near the homestead, cottages sufficient to accommodate as many labourers as the ordinary cultivation of the farm requires. The term "of engagement is yearly. The wages average about 40*l.*, nearly the half of which is paid in money, and the remainder in bread food, "potatoes, and either one cow's milk or the food of a cow. This system gives the farmer full command of labour, allows him to effect "necessary operations at the proper time, obviates the difficulty of obtaining and the expense of paying extraneous labourers, and when-"ever he requires it, irrespective of working hours, gives him the assistance of his labourers. On the part of the servant, it secures "constant employment, full and regular wages, notwithstanding sickness, and prevents the exhausting of physical energies by unneces-"sary and unrequited labour. This system, too, induces frugal habits, creates in the servant an interest in the employer's work, and "tends to elevate the position of both by making one scrupulous as to the character of the other.

"The labourers in the north are generally sober and industrious, regularly attend church in respectable clothing, educate their "children in reading, writing, and the simple rules of arithmetic, rarely contract debts, and if one of them dies a pauper the case is "exceptional.

"This furnishes a striking contrast to the condition of the rural labourer in the south-western counties of England. Yet I am con-"vinced that were the same system adopted in the south as in the north, the disparity would soon disappear.

"As the erecting of cottages would involve considerable expenditure, the change I have indicated could not be prudently carried "out at once; however, if farm cottages were erected as the village cottages decay, the system adopted in the north would be gradually "introduced.

"Wherever it is introduced, I believe that it will conduce to the mutual advantage of employer and employed, and diminish the "poor-rate, which, as now levied in several districts, threatens to restrain the mainsprings of industry, and foster the evils it seeks to "cure."

The power, for instance, of charging estates in favour of persons who own no responsibility for the condition of those residing on them, and by such charges depriving the nominal owner not only of the means of doing his duty, but of the feeling of responsibility also.

J. left for estate improvement, especially cottage improvement; even on a large estate, by the time all is done for which farm tenants most loudly call, unless the burdens be light, or the owner unusually self-denying, there is very little left to expend in the expensive luxury of cottage building.

The case of the small estates, however, is the worst, and in spite of the supposed protection of the law of entail, they are being swallowed up by their larger neighbours, or are passing into the hands of men whose whole means are not invested in land. Would it not be better that they should be allowed so to pass before they have inflicted undeserved suffering on everybody connected with them?

Corporate landowners.

83. If, however, the labourers on the estate of an ordinary life-renter are, as far as their cottages are concerned, in a bad way, the labourers on the estates of collegiate and ecclesiastical bodies, and all corporate bodies, whose members manage and divide the income of the estate, are in a much worse; the life-renter has a conscience, but the corporate landowner has none, and the system of beneficial leases, to which some of them still cling, is simply an abomination.*

Power of borrowing money under sanction of Inclosure Commissioners for cottage improvement in virtue of Act 27 & 28 Vict. c. 114., very little used.

84. It may be said that by the Act 27 & 28 Vict. c. 114. authorizing the Inclosure Commissioners to advance public money for the improvement of land, including the erection of labourers' cottages, and to sanction such loans from public companies, the legislature has acknowledged the evils arising from the settlemeut of estates, and has already provided means, as far as it prudently can, by which a life-tenant can execute all desirable improvements on his estate without altogether sacrificing his own interest or that of his successor.

With regard to general estate improvement, especially drainage, which was the motive power for this legislative action, I think this provision, as far as the action of the legislature is concerned, is sufficient, and that 25 years, the usual time allowed for the repayment of such loans, is not too narrow a limit. The rapidity with which the first Government loan was consumed and the large sums now yearly advanced by public companies under sanction of the Inclosure Commissioners is enough to prove this, as well as to prove how great an impetus this legislative action has given to the productive power of the country.

With regard to cottage improvement the case is altogether different, the rent of a cottage (even adding an estimated pecuniary value for the indirect advantages arising from good cottages, which as you say in your first Report "are not appreciable by all persons,") is so far below the rent-charge necessary to repay in 25 years the loan contracted for its erection, that few life-tenants can be expected to take advantage of the Act to which I am referring.

It would appear from paragraph 330 of your First Report, that between the years 1863 and 1866, the total sum sanctioned by the Inclosure Commissioners for the building of agricultural labourers' cottages was (in round numbers) 73,000*l.*; it would be interesting to compare this sum with the amount sanctioned by them during the same years for other estate improvements.

In your circulars of inquiry, referring to the Act 27 & 28 Vict. c. 114., you say, "*Have you any remarks to make upon this Act in regard to any additional facilities or any reduction of cost that might cause greater progress to be made in supplying the want of good cottages?* I have received very little evidence in answer to this question, except a general opinion that it won't pay to build cottages with money obtained at such a cost, as, for instance, that given by Mr. E. Moore, a landagent of great experience in Berks, who says (see Berks, Appendix A.):—

"Government should take measures and render the cost more reasonable."

Only one witness, of the many whom I have consulted, has ever answered that the powers given by the Act are sufficient to enable landowners to meet the cottage difficulty; this gentleman, an occupier of land in Oxfordshire, says, in answer to your question:—

"No; my landlord has erected cottages under the Inclosure Commissioners, and has found no difficulty." (See Oxon, Appendix A.)

This witness, however, being himself a director of one of the companies who advance money under sanction of the Inclosure Commissioners, would at once acknowledge that landowners in general do not take the same view of the subject, and I think this answer only proves that the landlord of the witness who makes it is liberal-spirited and courageous above his fellows.

Showing why the powers of the Act 27 & 28 Vict. c. 114. are not used, and suggestions for meeting the difficulty;

85. If then the power of charging settled estates with loans contracted for the improvment and building of cottages is to be of any practical use in meeting the cottage difficulty, I cannot help echoing Mr. Moore's words that "Government should take measures to render the cost more reasonable." To what extent this may be done, either by extending the time and leaving the money to be found as now by public companies, or by a State loan and extension of time combined, will, I think, be seen from the following calculation which shows the difference of the yearly charge which would be incurred for a loan of, say, 1,500*l.* for building 10 cottages under the rules of the Inclosure Commissioners when advanced by the Government at a charge of 3½ per cent., and when advanced by a public company (taking the Lands Improvement Company as an example) at 4½ per cent., adding in each case the yearly instalment necessary to repay the principal sum in the specified number of years.

The gross sum upon which the rent-charge would be calculated in the case of an advance by Government would be:—

	£	s.	d.	£	s.	d.
Cost of cottages	1,500	0	0	1,533	15	0
Inclosure Commissioners' charges 2¼ per cent.	33	15	0			

The gross sum upon which the rent-charge would be calculated in the case of the public company would be—

	£	s.	d.	£	s.	d.
Cost of cottages	1,500	0	0	1,608	15	0
Inclosure Commissioners' charges 2¼ per cent.	33	15	0			
Company's charge of 5 per cent.	75	0	0			

Mr. Clare Sewell Read, M.P., in his essay on the farming of Oxfordshire, says:—"It is computed that nearly one-sixth of the "income of the land of this county (Oxford), *i.e.*, rent and tithes, belongs to the Oxford colleges and other religious bodies. Speaking "generally, the property of the university is badly managed. The master and fellows of a college have no permanent interest in the "estate, and it is not often that the bursar is a man of business habits or conversant with the management of land." (It would be interesting to obtain a return from the college estates in Oxfordshire and Berks, showing the number and conditoin of the cottages belonging to the estates.—G. C.)

The difference in the amount of rent-charge for a loan repayable in 25 years (the longest term for which the Lands Improvement Company can advance money), 30, 35, and 40 years will be as follows:— J.

Number of Years over which the Loan extends.	Government Loan, 1,533*l.* 15*s.*		Company's Loan, 1,608*l.* 15*s.*	
	Rent-charge.	Rate per cent. on 1,500*l.* expended in building.	Rent-charge.	Rate per cent. on 1,500*l.* expended in buildings.
	£ *s.* *d.*	£ *s.* *d.*	£ *s.* *d.*	£ *s.* *d.*
25 years - - -	92 11 2	6 3 5	108 9 0	7 4 7
30 years - - -	82 19 8	5 10 7¾	98 5 0	6 11 0
35 years - - -	76 7 0	5 1 10	91 14 4	6 2 3
40 years - - -	71 10 8	4 15 4	87 1 6	5 16 1

A landowner, therefore, who borrows under the present system reduces his income at the rate of 7*l.* 4*s.* 7*d.* for every 100*l.* expended in cottage building, and under the present rules of the Inclosure Commissioners (which make cottages cost 140*l.* each), his income suffers to the extent of 10*l.* 2*s.* 5*d.* less the rent of the cottage, say 1*s.* 6*d.* a week, or 3*l.* 18*s.* per annum, *i.e.*, he is an absolute loser, as far as his own income is concerned, for 25 years of 6*l.* 4*s.* 5*d.* per annum for every cottage he builds with money so borrowed. If, however, the time of the charge was extended to 40 years his loss per cottage would be reduced to 4*l.* 4*s.* 6*d.* per annum, and if at the same time the money for this purpose was advanced by the State at 3½ per cent. instead of 4½, as by the public companies, and the companies charge of 5 per cent. on the amount of the loan saved, his loss per cottage would be reduced to 2*l.* 15*s.* 5*d.* per annum, and for all cottages upon which the farm tenant was willing to pay 5 per cent. interest his loss would be absolutely nothing, and there would remain no excuse not to house properly at least a portion of the labourers on his estate. by extending duration of rent-charge;

I do not here, as it were, advocate a State loan for the purpose of helping needy proprietors, but to do something towards meeting a terrible evil, as far as it is the result of the present state of the law.

Should it be held that the difference of the rent-charge under a State loan and one from a public company is not such as to justify or make advisable a Government loan, it will be desirable to ascertain how far the extension of the duration of the rent-charge to such a term as 40 years (the greatest extension which would practically reduce the annual charge) would interfere with the ability of loan companies to find the money which they now do through the aid of Insurance Offices; and failing their power to advance money to be repaid by instalments extended over so many years, is not the state of things such as to make it desirable to put a life-tenant for the purpose of borrowing money for cottage building in the same position as an owner in fee? Under proper inspection there need be no fear of overbuilding. The Inclosure Commissioners' inspectors would have no difficulty in drawing a safe limit for the proportion of labourers' cottages which any settled estate might with advantage possess. by allowing life-tenant to borrow as owner in fee for cottage building.

86. Suggestions for the improvement of cottages and proper inspection of their sanitary condition will be found in Oxfordshire evidence 93b and in Berks evidence 25, 27, 80, 86, 87, 88, and 89, as given by Sir Henry Dashwood, the Rev. R. Hooper, the Rev. W. J. Butler, T. L. Goodlake, Esq., chairman of Faringdon union, H. Tucker, Esq., high sheriff of Berks, H. R. Eyre, Esq., chairman of Newbury union, and Mr. W. Menzies, deputy-surveyor of Windsor Forest.* Suggestions for inspection of cottages by various witnesses.

It will be seen also from other parts of the evidence on the state of cottages, that the usual action taken by boards of guardians under the Act 23 & 24 Vict. c. 77., which constitues them the "local authority" for carrying out the provisions of the "Nuisances Removal Act," 18 & 19 Vict. c. 121. is by no means satisfactory. For the sake of economy the relieving officers are in almost every case appointed inspectors of nuisances, and the result is that unless there is unusual activity on the part of the board, as in the Faringdon union, the duty is almost entirely neglected. The fault, however, does not altogether lie with boards of guardians, the provisions of the "Nuisances Removal Act" are only sufficient as against ordinary nuisances, and as the guardians have no means of enforcing their powers,

* The Rev. H. T. Young, Stoken Church, Oxon, says:—"I would remark that the cottage accommodation for the labouring poor is, generally speaking, so bad that it cannot be sufficiently condemned. Horses and cattle are often provided with a more substantial dwelling than the labouring poor. I am well aware of the stereotyped answer made to every remark about cottages, viz., that it does not pay to build them, nor does it pay to build farm buildings, but a landlord could not let his farm without them, they being, so to speak, the fixture and furniture of the farm; he is obliged to build them, and I think there ought to be cottage accommodation on every farm sufficient for the labourers employed on it, just as there is sufficient stable room, &c. &c. for the requisite number of horses, &c. &c. I do not think that the moral and physical condition of the labourer can be raised and improved until proper dwellings are provided for him; the overcrowded state of many of the present cottages is injurious to health and the constitution, and the intermixture of sexes which it causes prevents the nurture of the proper feelings of decency, and where these are wanting, chastity will be wanting too. I am satisfied from observations which I have made during a period of 35 years passed in the ministry of the church, that before our teaching and preaching can have the effect we look for we must house the labourers in a better manner." Rev. H. T. Young.

Sir Henry Dashwood, of Kirtlington, Oxon, says:—"To no class of labourer is health more essential than the agricultural; it is impossible that he should be equal to his work unless he is well paid and properly lodged." Sir H. Dashwood.

Lord Camoys, chairman of Henley union, speaking for the union, says:—"Cottage accommodation is good in my neighbourhood, but there are over the face of the union cottages much too inferior for the comfort, health, and morality of the inmates. Cottages are everywhere too few, hence crowding and long distance from work. The rents of some of these poor cottages are too high, but the scarcity of them has a tendency to keep up their rents." Lord Camoys.

The Rev. R. Hooper, Upton, Berks, says:—"An inspector of cottages and dwellings of agricultural labourers would probably be one of the most efficacious means of remedying much of the social evils now prevalent. Compulsery powers of repairing, draining, &c. ought to be given. Many of our Berkshire villages contain cottages utterly unfit for human dwellings." Rev. R. Hooper.

Rev. W. J. Butler, says:—"The cottages in Wantage are generally owned by small proprietors, who are utterly reckless of the health and morals of their tenants. Wretched hovels destroy decency, self-respect, and love of home. Nothing is more necessary than that some measures should be taken to prevent small capitalists from running up utterly unfit dwellings and reaping a large per-centage at the expense of health, life, and morality. I could mention frightful results of the present system of dwelling houses." Rev. W. J. Butler.

Mr T. L. Goodlake, chairman of Faringdon union, says:—"In Buckland, Coleshill, Shrivenham, and Bourton, the cottages are exceedingly good; in the remaining 27 parishes of this union they vary from indifferent to very bad; many are mere hovels. In the larger parishes there are many small proprietors whose speculations in cottages cause great evils; in comparison with others, they are very highly rented. The habit of taking the rent weekly operates hardly against the tenant, indeed a moiety of our paupers' out-relief goes at once into the pockets of these needy owners. Overcrowding is very common. I fear school and church are utterly powerless Mr. T. L. Goodlake.

J. except by laying a complaint before the justices whose authority only extends to small matters, there is practically no means of dealing with dwellings unfit for habitation, or with the want of proper offices.

It would no doubt be a great improvement that the inspector of nuisances should be in a more independent position than the ordinary relieving officer, but the powers of the local authority are so limited that it can hardly be surprising that cottage reformers should ask for some more direct means of insuring an attention to ordinary sanitary rules.

Difficulty where bad cottages already exist not belonging to the landowner.

87. In a letter addressed to me, after reading my report on Beds and Bucks, Mr. Thos. Bennett, late agent to the Duke of Bedford, says that he thinks I overlook the difficulty which landowners have in dealings with cottages in open parishes where there are already sufficient, though poor, cottages to supply the necessary labour, adding—

"That the landowner if he erected all his land requires, has no power of pulling down or of restraining others in building; hence the fostering of over populated districts, by inducing young persons to stay in their native place instead of looking for work in the more thinly populated districts, consequently when the least slackness of labour (as in this exceptional year) sets in, there is an immediate outcry of over population."

A reference to my report will show that in paragraph 16 I say:—

"Where large open villages, in which the cottages belong either to persons who have built on speculation, or are the property of the occupiers themselves, now exist, yielding a supply of labour greater than the agricultural demand of the surrounding estates, the costs of buying, pulling down (to build without pulling down being only to increase the evil) and rebuilding is beyond the means of most landowners."

I ought perhaps to have added:—

"And constitute a great difficulty, entailed upon him by the policy or necessity of former owners, to even the wealthiest of landowners."

Certain stringent sanitary rules might meet this difficulty as far as speculators' cottages are concerned, but there would remain the difficulty of copyhold, keyhold, or squatters' cottages either freehold or held on titles which the landowner would have great difficulty in disturbing.

Mr. Benyon, M.P., for Berks, who has built 64 labourers' cottages during the last 12 years, besides bringing many other costly humanizing influences to bear on the labouring classes of Bradfield union, has partially met this difficulty by giving the owner of the wayside hovel a good cottage and garden either rent free or at the old quit-rent for the life of the present owner, on condition of a surrender of the old holding; not every squatter, however, will accept the terms, few indeed, except the younger men, who thus entail a loss for many years on Mr. Benyon, though an ultimate benefit to his estate.

"in the presence of the complete disregard of decency to which the poor are exposed; indeed the practice of modesty in the case of "females is scarcely practicable. Where a third sleeping room is provided it is usually let, if the poor are left to themselves. This is "prevented in the case of villages belonging to single owners. In the four parishes I have named there is nothing to be desired in the "way of water or ventilation; the remaining parishes vary in supply of water, and as to ventilation from indifferent to very bad. "I should like to add that, in my opinion, the provisions of the Common Lodging Houses Act might advantageously be applied to the "best interests of the poor by compelling all houses under 6*l.* a year rental to come within its ambit. The erection of proper cottages "is simply a luxury in which the more wealthy alone can indulge, the capital sunk in their erection being completely unremunerative. "Far otherwise is the case of cottages in the small towns; the poor flock to them, as the necessaries of life are cheaper than in the "villages; this enables them to pay double the rent, and as the houses are run up with the sole object of a quick return of the capital "invested, everything that can conduce to the comfort and health of the inmates is simply ignored. Marked have been the benefits of "the Nuisances Removal Acts, which the guardians of this union, encouraged by the magistrates, have carried out to the utmost of "their power. The ever presence of fever I attribute chiefly to the filthy habits of the poor themselves; their disregard and dislike of "cleanliness is inconceivable."

Mr. J. S. Bowles. Mr. J. S. Bowles. chairman of Abingdon union, speaking for the union, says:—"The cottages are neither better nor worse than those "of other rural districts in England; they are overcrowded, ill ventilated, with an uncertain supply of water."

Mr. G. C. Cherry. Mr. G. C. Cherry, chairman of Newbury union, says:—"The condition of many cottages in most parishes of this union is bad. Im- "provements in this respect are taking place. Many are overcrowded, whence must arise evil results to morality, although I cannot "quote instances wherein such results have been traceable to this cause alone."

Mr. H. Tucker. Mr. H. Tucker, high sheriff of Berks, says:—"In 1859 I obtained at my own cost a return of all the cottages in the Faringdon union, "showing the number of rooms in each, and the number, ages, and sexes of their inhabitants. From these returns I sent a digest to "'The Times,' which was published and produced a great sensation at the time.

"I urged several members of Parliament to bring the matter before the House of Commons, with a view to obtain a similar return "for the whole of England, believing, as I still do, that there is no other way of getting at the real state of misery and degradation in "which a large proportion of our agricultural labourers and artizans are housed, and this opinion is confirmed by all that has been done "by Government and is still being done to obtain information upon this subject. The means adopted can never secure the desired end."

Mr. W. Menzies. Mr. W. Menzies, deputy-surveyor of Windsor Forest, says:—"It is quite evident to every one that much of the unhealthiness and "immorality, both in cottages and villages, arises from the bad condition of the dwelling-houses of the labouring classes, and as the "effects of these evils fall upon the community generally, the Legislature is entitled to deal with the matter. . . . . .

"As the law stands at present, it is the duty of no one specifically to interfere with these matters and say where they are wrong; but "however difficult and formidable a work it is, every one who sees the effects is, I believe, convinced that some change for the better "must be attempted."

Mr. H. R. Eyre. Mr. H. R. Eyre, chairman of the Newbury union, in his address to landowners, entitled, "A Voice from Berks," says, ... "Some general and extensive plan of housing the labouring poor must be devised, and the private rights of landowners must not be an "obstruction to it—some plan which shall not depend upon the indulgence or the accidental benevolence and liberality of individuals "—some plan which shall recognize the personal liability of proprietors of all classes for the state and condition of their house "property.

". . . . . Let us urge upon the Government and our Legislature to take parliamentary action in the business and duty of housing the "people, that the resistance of ignorance, indifference, and self-interest may be overcome, and that the partial efforts which have already "produced an instalment of what is due to the requirements of the people, may be aided and supplemented by a general movement in "the same direction."

In his "Address to Tenant Farmers and Occupiers of Land in Berks," the same gentleman says, ... "Some say indeed, that this "matter (supply of proper cottage accommodation) is better left to the operation of the principles of political economy. I am "surprised at the suggestion, and more surprised at the source of it, because it not only seems to ignore all moral and social duty in the "matter, but it seems to ignore a fact which a little thought and a little inquiry would disclose: that the system of land tenure in this "country, and the difficulties connected with the transfer of land, render the principles of political economy practically inoperative. "If it were not so, we should not now be deploring the want of cottages; we should not have to complain that the supply does not keep "pace with the demand. . . . . .

"What, I would ask, has made the present but the past, and what is to make the future but the present? If we would not hand down "to posterity an evil which we deplore ourselves; if we would not perpetuate a system which helps to corrupt and demoralize our "people; if we would not forfeit the blessings we enjoy, we must at once put our hands to a work which will be twice blessed, blessed "to him who engages in it, and to him who has the benefit of it.

"I am very well aware that there are landowners in Berkshire who have been long engaged in remedying the evil which is complained "of, but the problem to be solved is not who is building and who is not building cottages, but how far the work ought to be optional "and discretionary, whether any safeguard should be established against a public evil, partly arising from the right of ownership, "and what security the tenant farmer and the people should have that the agricultural labourers should be well and sufficiently "housed.

". . . . . I propose, then, that we petition Parliament to promote by further public measures the necessary work of providing "additional habitations and homes for the people, and to find a national remedy for a national grievance."

J. Allotment.

88. It will be seen from the parish evidence (Appendix B. for each county) that small allotments or gardens are provided by a great majority of landowners, not only for the tenants of their own cottages, but for a large proportion of the poor who rent cottages from persons who are unable to make such a provision; for instance, in Steeple Aston (Oxon evidence 2b) the chief landowner who has only 15 cottages lets 22 acres in allotments, while another landowner provides 17 acres; in Steeple Barton (Oxon evidence 3) a proprietor of seven cottages provides 11½ acres of allotment ground; in Combe (Oxon evidence 9) the chief landowner provides allotments for twice as many labourers as he provides cottages for; in Stonesfield (Oxon evidence 20a), where only 10 cottages belong to the landowners, 31 acres of allotment ground are provided for 137 tenants; in Wootton a large landowner having seven cottages provides 40 acres of allotment ground let to about 160 tenants.

There are, however, parishes in both counties where the poor are but ill-supplied with either gardens or allotment ground, or can only obtain such accommodation at a very high rent; for instance, see evidence of Jas. Ward, labourer, of Wardington in Banbury union, where he says:

"I have a bit of potato land belonging to Col. North, about 20 poles; I don't know what I should have done without it. The land is 3½ miles from my house; I can't get any land near. I have had to pay 20*s.* a chain for potato ground, and I pay 2*s.* to Col. North. Lots of people would pay 20*s.* a chain, one of our farmers lets lands at that rate."

In East Challow, Wantage union, sufficient provision of allotment ground not being made by the landowners, the Rev. G. Purdue rents six acres of land which he divides into allotments of from 10 to 20 poles, letting them to the poor at the rent he pays, adding rates and taxes. Of the provision at Hanney, Mr. W. Athawes, occupier, says,—

"There is an allotment of good working land about a quarter of a mile distant from the village let to the poor at a high rent by a near resident country gentlemen; the matters want revision; some, having no need, farm these allotments; others, real paupers, can't get a rood."

My note on Stanford-in-the-Vale on this subject is (see Berks evidence 40), as follows:—"There is "some land in this parish belonging to the poor of the parish of Shrivenham and let by the "trustees to the rector of the adjoining parish of Shellingford. Some part of this land is let in "allotments of 20 poles to the poor of Stanford at the rate of 4*l.* an acre (several labourers in "Stanford have not got any allotment ground)." What Mr. Purdue does for East Challow the Rev. J. C. Clutterbuck does for Long Wittenham, letting five acres near the village in allotments of a chain (16 poles) each.

A garden attached to the cottage is of course better than an allotment even at a very moderate distance from it, and very few landowners' cottages are now built without such a provision, which is easily made where cottages are not built in crowded villages. Many old cottages also belonging to landowners are well provided with garden ground; for instance, on the fine estate of Mr. Wroughton in Wantage union (see Berks evidence 7a) every cottage (upwards of 200) has a garden attached to it.

It will be seen from the evidence that the size of allotments let by landowners seldom exceeds 40 poles, and varies from 40 to 16 poles, *i.e.*, from one-fourth to one-tenth of an acre. Of the allotments on the Duke of Marlborough's estates in Oxfordshire, Mr. Jas. Napier says,—

"There are 914 allotments on the Duke's estate in this county; a few of them are 20 poles, but the greater portion are 40 poles each."

Judging from Dunstew, one-eighth of an acre appears to be the usual size of allotment or garden on Sir Henry Dashwood's estates. At Glympton, Mr. Barnett gives each family one-fifth of an acre at a very low rent. On the question of size Mr. E. L. Franklin, landagent, a very high authority on such matters, says (see Oxon evidence 49):—

"I find 20 poles to be quite sufficient and as much as a labourer can well manage with a garden."

Mr. Simmonds, bailiff to Mr. Walter, of Bearwood, says,—

"I asked four of our men this morning what size of garden or allotment they would like; they all said that 25 poles, the quantity which Mr. Walter allows, is sufficient."

Allotment awards.

89. Berks evidence 3b and 23e give examples of allotment awards made by the Inclosure Commissioners in lieu of the right of cutting furze and bushes formerly possessed by the poor of the parishes concerned. It will be seen that the quantity of land obtained by each of the 43 families in East Lockinge which receive an allotment under the award for that parish is about 12 poles, the rent paid by them, less expenses, being divided equally amongst all the poor householders of the parish. I have very little doubt that the award gave the poor a full *pecuniary* equivalent for the loss of the now almost worthless right of cutting furze; as to whether the conversion of such rights into allotments of the size named is the most desirable use that can be made of common rights is another question which I would be inclined to answer in the affirmative, granted that the number of the allotments is not such as to induce a larger number of persons to remain in the parish than it can find continuous employment for.

90. In Oxon evidence 32 you will find the history, as nearly as I could obtain it, of the past and present of the O'Connor allotments in Minster Lovell parish in Oxfordshire.

The O'Connor allotments in Oxfordshire.

In the year 1847 (about the same time that he purchased some other estates for the same purpose) Mr. Fergus O'Connor purchased an estate of about 300 acres in Minster Lovell parish on behalf of the shareholders of his land company. This estate he divided into 85 allotments of from two to four acres each (36 of them being four acres) and built a cottage on each allotment, distributing the plots of ground with their cottages amongst those of the shareholders of the land company who had paid up the full amount of a share in the order in which they stood upon his list. When a shareholder obtained possession of his little farm he received from the funds of the company "head money," at the rate of 7*l.* 10*s.* an acre, and was charged with his share of the interest of a mortgage debt of 5,000*l.* To use the language of Mr. Freer who now owns about one-third of the estate, "as "long as the head money lasted all went well," but in a few years many of the allottees, who were chiefly artizans from large towns left their allotments, and the interest of the debt not being paid the

J. mortgagees offered the estate and newly built cottages for sale; the mortgagees were, however, unable to effect a sale, and the state of affairs having been brought before the House of Commons, the estate was handed over to the Court of Chancery, which on the 6th of October 1851 appointed an official manager to wind up the affairs of the land company. The result of the winding up was that a considerable number of the allotments were sold and the possession of the remainder was confirmed to the allottees on payment of a rent-charge, which in the case of a four-acre allotment amounted to 9*l.* 10*s.*, a tolerably fair farm rent (allowing 3*l.* for the cottage), though such an allotment, subject to the rent-charge, can now (see Oxon evidence 32d) be sold for upwards of 100*l.*

When I visited the Charterville in October last I found only two of the original allottees in possession of their cottages and ground, and one of these was not strictly in possession, as his allotment had just been sold. This man's evidence (see Oxon evidence 32d) was as follows:—

"Those that paid up a whole share got the first choice of an allotment. I paid up mine, 5*l.* 7*s.* 6*d.* I got one in six months. I never would if I had known what I do now. It has taken me 20 years to learn how a man can live without victuals, and I have just about come to it. Thousands paid up part of their share and lost it all, and I believe they were best off. I got 30*l.* head money for four acres.

"My allotment has been sold for 106*l.*, but there is a rent-charge on it of 9*l.* 10*s.* a year."

Adding the "head money" [which I accidentally omitted (Oxon evidence 33c)] brings up my estimate of the expenditure of the scheme to 22,250*l.*, which agrees very closely with the account given by persons living in the neighbourhood, by whom it was generally put at 22,000*l.*; while, according to Mr. Freer's evidence, and judging from the price obtained for the allotment spoken of above, the whole value of the estate is now about 22,500*l.* (taking the value of a cottage and four acres to be 300*l.*)

Cause of failure.

It is evident, therefore, that if the shareholders could have held on the estate till now, the scheme would not have injured them pecuniarily beyond the loss of interest for which they accepted the chance of an allotment as compensation, and we must look to other causes for an explanation of the speedy break down of the land company. I think the evidence makes the explanation tolerably apparent. To make a living for himself and family off even the largest of these allotments while paying a rent-charge equal to an ordinary farming rent would require all the energy and skill of an able-bodied agricultural labourer; to the class of men whom Mr. Fergus O'Connor introduced it was almost an impossibility.

Mr. Freer's evidence on the subject is of considerable value. He says,—

"I have purchased 26 allotments, and put three or four together, letting them to one man, who sub-lets the cottages. A man may get a living off 10 acres let a fair rent, or he may get a living off, say, two acres for which he pays no rent or rent-charge. None of those who have these allotments singly at a rent are able to live off them. I let four-acre allotments with the house at 13*l.*, *i.e.*, 50*s.* an acre for the land and 3*l.* for the house."

Summary of evidence on allotment systems.

91. The above evidence, I think, confirms the view which I was led to adopt by the evidence I had previously received on the same subject, that every farm labourer's cottage should, if possible, have attached to it a garden of not less than 20 nor more than 40 poles. There is, however, a class of men, not usually engaged as farm labourers, whose services at high wages in times of pressure are very useful to the agricultural community, for whom a much larger system of allotments might be desirable, more especially if the allotments were of such a character as to induce them to keep cows, and so supply milk at a moderate price to labourers, whose young families stand much in need of it.

Benefit Societies.

92. In the evidence which I received in Bedfordshire on the subject of benefit societies, I quoted some extracts from a paper on that subject read at a meeting of the Central Farmers' Club in November 1867 by Mr. Charles Howard, of Biddenham; and I have now put in evidence a copy of a letter addressed to Mr. Howard, after hearing his paper read, by Captain Dashwood, a large occupier of land in Oxfordshire, who has taken a great deal of trouble to investigate the difficulties in the way of establishing benefit societies on such a scale as to enable the labouring class of a parish or small group of parishes to form societies on a safe basis, so that, to use Captain Dashwood's words, "the "management may be kept as local as possible to enable members to overlook each other."

Showing the difficulties in the way of labourers anxious to form Benefit Societies on a safe basis, with suggestions as to how the difficulty might be overcome.

Captain Dashwood's experience in endeavouring to remodel the rules of a small club in his own parish will point to the difficulties to be encountered by labourers when left to their own resources; in speaking of this club he says,—

"With the help of a neighbouring clergyman, who had had great experience in Berkshire with such clubs, and with the assistance of Mr. Finlayson, the Government actuary, and Mr. Tidd Pratt, and his office, I trust I have been able to start the club on a safe basis, and that it now only depends for its success on the good management of its members."

And again he says,—

"Actuaries in general are obliged to put their rates too high, and they really have few good guides for such clubs, as all the receipts hitherto have been so mixed up with subscriptions from honorary members, and the outgoings with extra payments. The actuaries frequently limit the tables to the age of 65. This is impracticable and unnecessary with an agricultural population."

In order to get further information than Mr. Finlayson or Mr. Tidd Pratt were in a position to afford, Captain Dashwood examined the rules of a large number of reputedly good clubs, and with many of these he finds great fault.

The following are the principles on which Captain Dashwood thinks these societies should be founded:—

"1st. They should not be held at public houses.

"2nd. Clubs should be composed of about 150 members, say from one or more parishes, so as to keep the management as local as possible, that members may be able to overlook one another.

"3rd. They should be entirely managed by the benefit members.

"4th. There should be a revision of funds and a revision or division of surplus every five years, accompanied by power to raise an extra subscription if funds get too low.

"5th. The tables should include several classes, with different payments in quinquennial periods according to age of entry (worn out old age must practically be looked upon as sickness), few working men remain long

J.

quite past all labour, and the rules recommended by Mr. Tidd Pratt in his pamphlet of December 1865, as to the number of weeks of full pay, &c., prevents this charge ever becoming very high.

"6th. The *Medical Fund* payment should be ample to cover the expense of making contracts with different medical men, and women should be allowed to join this as well as the death fund.

"7th. There should be a benevolent fund, to which all payments from honorary members should be carried; to this fund also each member should pay yearly one day's sick pay, and the accumulation from other funds may be transferred to it at the end of every five years. This is a most important fund, as it meets the difficulty of the worn-out-by-old-age members and of cases of long sickness, and assists such without drawing too heavily on the sick fund."

For clubs of the size recommended by Captain Dashwood I see no fault to be found with these principles or rules, and I perfectly agree with him that worn-out old age must be looked upon as sickness for the reason he gives that "few working men remain long past all labour." The latter part of the 4th rule (accompanied by power to raise an extra subscription if funds get low), and the 7th, which acknowledges the necessity of a benevolent fund, and contemplates the aid of honorary subscriptions, exhibit, I think, the weakness of small clubs; and that there is no necessity to so limit the size of clubs is, I think, shown by the success of the Odd Fellows and Foresters, of which Captain Dashwood says, "I think as useful clubs as any in England are the Manchester Odd Fellows and the "Foresters." I cannot see why the same active supervision from benefit members could not be carried on over a larger area of parishes, and the management conducted by committees in the different parishes, as well as by a single committee for a smaller area; there is of course the question of confidence, or rather want of confidence, in each other, and it may be that the smaller club is the one which would succeed best if left entirely to the management of the benefit members.

As the present Government have undertaken to introduce a Bill to enable the Post Office to grant insurances on life for 5*l.*, there is now I think no need of a burial fund, or still better of burial societies, and as the Post Office savings banks, and Government annuities are everywhere at command to give a good account of the investment of a labourer's savings, there remains only the need of a sickness club, and whether that be conducted on the small scale recommended by Captain Dashwood, or on a much larger scale, it stands equally in need of carefully calculated tables, which would show, as nearly as the best actuaries in the country can ascertain, what proportion the payments and allowances should bear to each other for different scales of payment as well as for different numbers, of members, *i.e.*, that men who wish to join such clubs, after determining the number of members should be able to turn to the tables and see in what proportion men insuring for this or that amount of sickness pay should subscribe and how that that subscription should vary with the age of the man at the time of admittance.

How Government could help the cause of Benefit Societies.

To draw up such tables with anything like accuracy is, I apprehend, a very difficult task, and has not, as far as I am aware, been as yet satisfactorily performed, nor is likely to be with the funds at the disposal of small clubs, and it is in the performance of this task that I think that the Government might further the cause of benefit societies by putting into every man's hand at a moderate price a table of the kind I have described, and a good specimen of rules; by doing, in fact, for the country what Captain Dashwood and others like him have done for their parishes.

If the chief fault of the southern labourer is, as I think it is, improvidence, it is most desirable to encourage any symptom of the opposite virtue, such as the increasing disposition to join benefit societies, not for the sake of the beer, but for the sake of independence.

The rules of several district clubs in Berkshire, such as the Vale of White Horse, the Farnborough and the Yattendon clubs, were sent to me, and I was informed that such clubs, as well as branches of the Odd Fellows and Foresters, were now more popular than the old beerhouse clubs.

A somewhat greater strickness in the administration of the poor law, as far as out-door relief is concerned, would no doubt, as Captain Dashwood says, help the cause of benefit clubs, and check the pauperising tendency I have before alluded to. In point of fact, the greater strictness in this respect practised by the board of guardians in Farringdon union, has, according to the evidence of the relieving officers, already had this effect.

Beerhouses.

93. In his report on the "Farming of Oxfordshire," Mr. C. S. Read says,—

"Perhaps in no county in England is the love of beer among the labouring poor so general or so extravagant as in Oxfordshire. If anything out of the common routine on a farm is to be done "a drop of beer" is wanted to make it go off pleasantly, ... most unfortunately the rage for beer when at work is only second to the love of it at the alehouse. This miserable infatuation produces wretchedness, poverty, and crime."

As far as my experience goes, the Oxfordshire labourer is in this respect no worse than his neighbour in Beds, Bucks, and Berks. I have already alluded to the mischief done by the alehouse and love of beer in the two former counties, and the same evil is everywhere apparent in the two with which I am now concerned, and is the more apparent to those who have seen the farm labourer when he does not suffer from what Mr. Read calls "this miserable infatuation." Thus the wife of Col. Bowyer's farm bailiff at Barton, a Scotch woman, says (see Oxon evidence 3e):—

"If the men here get a shilling extra, it goes in drink to a certainty."

Mr. John Hedley, bailiff to Mr. Wroughton, of Woolley, says (see Berks evidence 7b):—

"The greatest difficulty here with men, especially daymen, is to keep them from beer; if a man earns extra wages at anything he takes it to the beershop."

Mr. Hardy, bailiff to Col. Lloyd Lindsay, says (see Berks evidence 23b):—

"The worst fault our men have is beer drinking."

In close parishes the beerhouse is either altogether absent or is kept in proper control by the landowner, and this is one of the reasons (the others being constant work and cheap cottages) why in such parishes the labourers always appear to be better off. Mr. J. C. King, speaking of Beedon parish in Wantage union, says:—

"Our men are as well off as cheap cottages, good allotments, and the absence of a public-house can make them; they are better off than in the adjoining parish of Hampstead Norris, the only difference in our farm being that there is no public-house here."

J. Mr. Thos. Tanner, a large occupier in Newbury union, says (Berks evidence 59a):—

"You will find a very few cases of real distress, and where it does exist it is from the effects of drunkenness, and that is caused from the "beershop," the curse of this country, being brought to their own doors. I think if our rulers would turn their attention to this, it would be a certain step towards improving the condition of the working class. They themselves would be glad to have the temptation removed."

In hay time and harvest, when men are working by the day, a gallon of beer per man is a common daily allowance, and many farmers stated to me that this allowance was not sufficient to satisfy the men.

A good many farmers, as will be seen from the evidence, give money instead of beer, thus enabling any man who chooses to save the cost of what he would otherwise have been, in a manner, compelled to drink; this is, I think, distinctly a better plan than giving beer, but it has been found that the result has often been to send them to the nearest beerhouse for worse beer than the farmer would have supplied, and to meet this difficulty, Mr. Samuel Druce, of Eynsham, gives his men malt and hops which they can convert into beer or money as they please.

The evil of wasting more of his wages than is necessary in beer consumed in the hay or corn field is as nothing compared with the loss which the farm labourer in these counties suffers from the consumption of the same article, of a worse quality, in beerhouses, and I confess I see no end to this mischief till the ordinary beerhouse licence to sell beer "*to be drunk on the premises*" is abolished. I do not for a moment desire that the labourer should be denied every facility for quenching his thirst in beer; on the contrary, I should like to see beer sold across every counter with as little restriction as bread and butter, save only that it should *not* be drunk on the premises; I would confine the licence to sell beer to be drunk *on* the premises to that class of houses which are also licensed to sell spirits. Under such a system a man would probably take home to his family only so much beer as he could conveniently pay for and as they could consume without injury, and he would be robbed of the temptations to excess which it is the business of the beerhouse keeper to provide.*

94. In my report on Beds and Bucks I said, "The great lessons which the labourers in these counties "require to be taught are independence and providence," and I have again to repeat that these are the lessons most wanting to the labourers of Oxfordshire and Berks; whatever, therefore, interferes with this teaching, helps the beershop and degrades the labourer. This brings me to a subject, in order to treat of which I put in evidence certain statistics in the Appendix to my former Report, but I am glad that I did not then call your attention to it, as I am now in a better position to justify the impression which I then entertained as well as to support my own impression by the opinions of persons whose judgment cannot fail to carry weight. The influence I allude to adverse to the fostering of provident habits is the present administration of the *Poor Law*, and especially the lax and uncertain manner in which *out-door relief* is given.

Pauperism.

Nothing will, I think, serve better to illustrate the effect of the manner in which relief is administered than a comparison of the rate of pauperism and cost of relief per head of the population in four of the rural unions in each county in which the general circumstances affecting the labouring class are as near as possible the same.

Rate of pauperism in eight unions in Oxfordshire and Berks.

County.	Union.	Population.	Acreage.	Acres per Head of Population.	Proportion of Paupers to Population.	Expenditure on Relief of the Poor for Year ending Lady Day 1868.		Proportion of Out-door Relief to In-maintenance.	Expenditure per Head of Population.
						In-maintenance.	Out-door Relief.		
						£	£		s. d.
Oxford -	Bicester -	15,555	64,127	4·12	1 in 18	698	3,430	About 5 to 1	5 3½
„ -	Henley -	18,200	61,662	3·38	1 in 11	1,848	6,981	Nearly 4 to 1	9 8½

„ -	Wantage -	17,308	75,700	4·37	1 in 14½	868	5,490	Above 6 to 1	7 4

Contrast between Faringdon and the other rural unions of these counties.

From this it will be seen that whereas in *Faringdon union* there was 1 person in 30 receiving relief on the 1st of January 1868, the average of the other seven unions gives 1 in 14. In Faringdon the proportion of the cost of out-door relief to in-maintenance is under 2 to 1, the average of the seven other rural unions which I have taken gives nearly 5 to 1. In Faringdon the cost per head of the population for relief of both kinds is 3*s.* 9*d.*, in the other seven unions it averages 7*s.* 7*d.*

Although taking each individual case, the amount of pauperism and cost of relief does not vary inversely as the proportion between the out-door relief and in-maintenance; on the average (as will be seen from Oxon evidence 101 and Berks evidence 90, where the amount of pauperism in each union of the county is given) it distinctly does so, and accounts for the fact that while the whole of England (towns and all) shows 1 pauper to 19 of the population; the rural districts show 1 to 16;

* On the beerhouse question, Mr. T. L. Goodlake, chairman of the Faringdon union (Berks evidence 80), says:—"The multiplication of low beerhouses beyond the control of the justices aggravates the social condition of our poor. I almost despair of any "improvement till beer and spirits are sold across the counter like any other necessary of life."

Mr. Walter, M.P. for Berks, says (Berks evidence 85):—"Instead of placing the licences in the hands of the magistrates, who would be "apt to exercise the power capriciously and sometimes unjustly, I would allow everybody to sell beer *not* to be drunk on the premises, "and give the magistrates ample power to take away the licence in case of its being abused. People must have beer, but there is no "occasion for them to meet and drink together in beerhouses—there is the evil. If they want to meet together for convivial purposes, "which they must be allowed to do occasionally as well as their betters, then let them go to the public-house, which I agree should be "licensed by the magistrates as at present."

Sir Henry Dashwood, in a private letter to me, expresses the same view, with some doubt as to whether the licences for the higher class of public-house should be left in the hands of the magistrates.

it is, in fact, the towns which reduce the average for the county of Oxford to 1 in 15, and the towns aided by Faringdon union which reduce the average for Berks to 1 in 16½.* J.

If then pauperism has been reduced in Faringdon union to less than one-half of the average of all the unions similarly situated in these two counties, or in fact of the rural unions of England, without any improper pressure on the labouring class, a lesson in providence has been taught which will do as much good as the legislative suppression of beershops.

That there is no such improper pressure, and that the decrease of pauperism is simply the result of good management and a proper administration of the poor law, I feel entirely convinced after questioning very closely the labouring class themselves, the officers of the union, and persons residing in it who had no interest in the matter sufficient to sway their judgment. In the cases where I found out-relief given it appeared to me to be given fully as liberally as in other unions; the difference between this and other unions being that out-relief is never given unnecessarily and never given at all until the whole facts of the case are known to the board; where help is desirable beyond what should legitimately be charged to the public purse it is given privately by those who are interested in and thoroughly acquainted with the case, and there is no tendency to use the rates in aid of low wages or slack work in winter.†

Faringdon union is fortunate enough to possess a very energetic chairman (as in most unions an ex-officio guardian) who is assisted by what appeared to me an unusual attendance of other ex-officio guardians and by an efficient and highly paid staff of union officers. Speaking of the chairman two or three of the labouring class, whom I questioned about the action of the board, used the same expression, saying, "he's hard at the board but he's a good man is Mr. Goodlake." I don't know that any greater praise could be bestowed on a chairman of a board of guardians.

I do not for a moment mean to say that the poor law is worse administered, or as some people might think more liberally administered, in the counties of Oxford, Berks, Beds, or Bucks than in other rural districts. I have seen the same effect growing in the very union in which Mr. Henley, in his excellent Report, pointed out to you the very favourable circumstances which surround the agricultural labouring class, and it may surprise you to know that in that "Northern Arcadia" there is 1 person in every 19 receiving union relief.

Consequences of lax system of out-relief.

In the north the effect of a lax system of out-relief manifests itself most in a growing disinclination on the part of well-paid labourers to do anything towards the support of their parents. In the counties which I have lately visited under your instructions it is exhibited in the number of young able-bodied men who without any hope of work in winter crowd themselves into the open villages. I scarcely visited any open village during last winter without finding a certain number of young men out of work and with no apparent intention of going out of their parish to look for it. In some villages, such as the Bartons, Childrey, and East Hendred, I found from 20 to 30 such men, and was told that it was quite amusing to see how they planned to get themselves on the union.

As to the effect of the present manner of administering out-door relief, Sir Henry Dashwood, formerly chairman of the Woodstock union, says (see Oxon evidence 93a):—

"It is becoming the means of granting pensions indiscriminately to *worthy* and *unworthy*, and places the worthy man, who has by good conduct earned assistance from his children or other sources of private charity, on a level with the *unworthy*, who has forfeited all such claims, and it will discourage the labourer from making any provision whatever for old age."

I could not express my own feeling on the subject better than by using Sir Henry's words.

Half-rating as a proposed remedy.

A proposed remedy for this state of things I have already alluded to, as explained a few days ago by Captain Dashwood at a meeting of the Central Farmers' Club, viz. such a system of half-rating as prevails in Ireland and Scotland, which by levying one half the poor rate on the owners of property would bring the question of rates home to the landowning class and induce them to aid in the administration of the poor law, instead of as now leaving it entirely in the hands of tenant farmers, except when some matter of patronage or of unusual interest is on foot. Whether such a system would result in all the good which its advocates believe, may be doubtful, but it would at least be an improvement on the present system.

Law of settlement and removeability.

95. One desirable amendment in the poor law itself has been frequently mentioned to me, and that is the abolishing of all that remains of the law of settlement and removability. It is so difficult for a board of guardians to exercise any supervision over out-union relief that very many unions now refuse such relief altogether, no doubt inflicting in some cases undeserved hardship. To make every person requiring relief chargeable to the union where he or she happened to be, would, no doubt, prevent any such hardship; but would perhaps cause some difficulty in dealing with vagrant or non-resident paupers. A scheme for the treatment of this class, as proposed by Mr. Thornhill, chairman of the Woodstock union and vice-chairman of quarter sessions for Oxfordshire, given in Oxon evidence 96, is worthy your attention.

Industrial schools.

96. In Berks evidence 65d and Oxon evidence 64b and 63a, will be found a description of the rules and expenditure of industrial training schools supported by Her Majesty the Queen at Windsor, the Countess of Macclesfield at Watlington in Oxfordshire, and the Rev. C. E. Ruck Keene at Swyncombe in the same county.

---

* I am aware that in some districts, where the rate of pauperism is lower, the proportion of out-relief to in-maintenance is higher than in the unions I am speaking of; but a comparison of the effect of such relief can only be made between unions in which the character of the labouring classes is the same. To the more self-reliant and independent Northern or Welsh labourer, for instance, the demoralizing effect of out-relief, administered by authorities who cannot or will not closely examine the cases of the recipients, comes less quickly, but not less surely.—G. C.

† Mr. E. W. Moore, agent to Lord Radnor, says (Berks evidence 33):—"The reduction of the pauperism in Faringdon union is only the "result of a careful examination of cases; the board are liberal when relief is necessary. The rule is not to give immediate relief to a "man who has been in regular work up to the time of application. We make him wait a few days or a week. Another rule is not "to pay a member of the patient's family as a nurse, except under peculiar circumstances."

Mr. Jas. Jeffries, R. O., Faringdon union, says (see Berks evidence 76):—"In this union we are very strict in examining into the "circumstance of every family by whom an application for relief is made; the result has been a great decrease in the expenditure on "out-door relief, while the persons who receive relief are better satisfied than under the old system, and the labourers generally have "been induced to subscribe to benefit clubs, such as the Farmers' Club, at Uffington, the Vale of White Horse Club, and the Farnborough "Club. Where cottagers keep lodgers we reduce the allowance by 1s. for each lodger; this has the effect of discouraging them from "crowding their houses with lodgers."

Mr. R. Gorton, master of the workhouse, and Mr. T. Wright, relieving officer, gave similar evidence.

J. G.

Her Majesty's at Windsor.

The following is my note taken at the time of my visit to Her Majesty's school,—

"There is an educational and industrial school in Windsor Park, entirely supported by the Queen, where about 120 children of persons employed by Her Majesty are educated free of expense; of these 50 boys and 50 girls are clothed (the boys in jackets and knickerbockers of black and white checked Scotch cloth and black leggings, the girls in a dress of a smaller check, with a scarlet cloak for winter); 30 boys and as many girls receive a dinner every school day, and 12 boys and as many girls under 7 years of age are admitted without either of these privileges. The school is an excellent building, with all the appliances necessary for teaching the girls cooking, baking, and washing, and there is a large garden where the boys receive their out-door training. A child of any person employed by Her Majesty is eligible after 7 years of age if it can pass the first standard of the Revised Code, and may remain, a boy till he is 15, a girl till she is 16, during which time each child costs Her Majesty about 6*l.* 10*s.* per annum."

A boy therefore who enters this school at 7 years of age, and leaves it at 15, will have cost Her Majesty upwards of 50*l.*; and a girl who remains till she is 16 will owe to the same kindly benefactress an education which has cost nearly 60*l.* I was particularly struck with the appropriateness of the dress of the children.

The Countess of Macclesfield's.

In Lady Macclesfield's school, which is for girls only, the pupils are boarded and lodged as well as educated, and the establishment, which provides accommodation for 12 girls and the matron, is perfect in all its arrangements; these as well as the yearly expenditure and general rules for the management of the school are so accurately described by her ladyship in Oxon evidence 64b, that I need only refer any person anxious to follow so good an example to the description there given. The cost of, as it were, finishing the education of each girl would appear to be about 40*l.*; after this expenditure the pupil is in every way fitted to obtain a good place in domestic service.

Mr. Ruck Keene's.

An account of the Swyncombe industrial school for boys founded so long ago as 1846 by Mr. Ruck Keene and since supported by him will be found in Oxon evidence 63a; here, too, the arrangements of the school, and especially the industrial department, are so well described that any person desirous of following Mr. Keene's example may find a pattern. An interesting feature in the Swyncombe school is that the garden department in which about 12 boys are engaged is almost self-supporting, and Mr. Keene thinks might be made entirely so. In the year Michaelmas 1867 to Michaelmas 1868 the balance against 12 boys, allowing a fair price for their labour, was only 5*l.*

Mr. Keene, after so many years of experience, may be allowed to speak with some authority on the advantages of industrial training; in his "Notes on Popular Education" (see Oxon evidence 91) he says:—

"In all cases of popular education I am of opinion that there should be a mixture of manual employment with the mental training. It relieves the irksome sameness of elementary education through the day, and in so doing allows the mind during the shorter period of tension to be more capable of digesting its lessons, whilst the bodily exercise and the incipient fitness for the employment and trade to which the child may afterwards be called will always be found most advantageous to its future career."

Example of the effect of better food and good example on inferior labourers.

97. To illustrate the difference of earnings at the same piece-work wages, and the levelling-up effect of good food and example, I have put in evidence an analysis of the pay-sheets, showing the earnings of mixed gangs of English and Irish drainers, employed during last autumn and winter on three estates in Northumberland (see Appendix C., 96):—The practice of these drainers is to work together in parties of two, or at most three, such parties being, in the cases taken, always composed of men of the same nationality; in other respects, they are entirely on an equality as to means of earning, the parties of two or three men taking each drain in succession as they finish that in which they have previously been working. It will be borne in mind that the English and Irish here compared are men probably of the finest class physically of their respective countries.

The total number of men composing these gangs was 46 Englishmen and 31 Irishmen; of these 43 Englishmen are described by Mr. Batty, the superintendent of the drains, as having "drained for "several years constant at the work," and 23 of the Irishmen are described as having been in England for several years, some of them for 15 years, none for less than 6 or 7 years, leaving a remainder of three Englishmen and eight Irishmen who are described as beginners, or not practised hands. The result of a comparison of their earnings shows that whereas the English beginner earns an average of 4*s.* a week more than the Irish beginner, better food and about 10 years' practice reduces the difference to 1*s.* 4½*d.* a week; this last difference is curiously enough the same to a fraction in the case of the practised hands engaged on Captain Leylands' estate and my own, though the earnings in the latter case are nearly 3*s.* a week higher than in the former.

In the first case—

The practised English drainers earned 16*s.* 10½*d.* a week.
„ Irish „ „ 15*s.* 6*d.* „

In the second case—

The practised English drainers earned 19*s.* 9*d.* a week.
„ Irish „ „ 18*s.* 4½*d.* „

Northern and southern labourers.

98. As a drainer is very much guided in the price he will accept for cutting by a comparison between what he supposes he can earn, and what his neighbours, who are not drainers, can earn, these earnings when compared with the evidence which I received on the same subject in Wokingham union, are another indication that labourers' earnings are not much higher in the northern than in the south-midland counties of England.

Deducting the value of the cottage and garden, which are supplied rent free by the landlord in the north, the Oxfordshire or Berkshire labourer costs his master nearly as much as the Northumbrian; and bearing in mind this fact, the following evidence which I received from northern bailiffs in Berks after considerable experience of the value of both classes of labourers, will at least be an indication to you that I cannot have made much error in my estimate of the cheapening of manual labour in the north through the superiority of the northern labourer, male and female. Mr. John Hedley (a Northumbrian) farm bailiff to Mr. Wroughton, of Woolley Park, in Wantage union, says (see Berks evidence 7b):—

"There is a great difference between the labourers here and in Northumberland. I would much rather pay a Northumbrian hind 16*s.* a week than a Berks carter 12*s.* I have one Northumbrian as a carter foreman, what you would call a ploughman steward; he has 17*s.* a week, besides his cottage free, say 18*s.* a week. Men are so inferior here that we are obliged to employ more than you do in the north." J.

Mr. Hardy (a native of Mid-Lothian), bailiff to Col. Lloyd Lindsay, in the same union, says (see Berks evidence 22b):—

"Our men here are very inferior to Scotch labourers; two men there do as much as three here."

Mr. James Robertson (a native of Perthshire), farm bailiff to the Earl of Radnor, at Coleshill, says (see Berks evidence 33a):—

"I always employ as many men here in doing such things as spreading dung as we used to employ women in Scotland, four to a plough opening the drills, and the men think they are going to be killed with hard work."

If you add to this the superior discipline, which having the cottages round the farm offices permits, you will have all the elements which induced me to institute the comparison, for which I had at the time ample means at my disposal and have since had ample means of verifying.

99. I cannot say that I see any marked difference between the labourers of the four counties which I have visited under your orders; what difference there is is in favour of the Berks and Oxfordshire labourers, and I would be inclined, falling back on the evidence which I received, to attribute the comparative physical inferiority of the Beds and Bucks labourers to the effect produced on the women by such occupations as straw-plaiting and lace-making. Beds, Bucks, Berks, and Oxfordshire labourers.

100. It only remains for me to thank all classes of persons in Oxfordshire and Berks for the anxiety which was everywhere displayed to assist me in conducting the inquiry with which I had the honour to be entrusted. However inquisitive and unnecessary the questions I asked might appear, there was ever the same readiness to answer, and if I have omitted anything which would have been interesting to you to know the fault lies entirely with myself.

I have the honour to be,
Gentlemen,
Your obedient servant,
GEO. CULLEY.

J. 2.

REPORT.

To Her Majesty's Commissioners.

Gentlemen,

1. I have the honour to lay before you the evidence which I collected during a short visit to the counties of Derby and Herts.

Time and mode of collecting evidence.

As the time at my disposal was limited to about a fortnight in each county, I selected the more central portions for personal inquiry, and devoted my time more especially to obtaining evidence illustrative of any peculiarities in the condition of the agricultural labouring class which might have escaped my notice or that of my colleagues in the reports which we have already had the honour of presenting to you.

2. I attended by appointment meetings of the boards of guardians for Bakewell, Chesterfield, Belper, and Burton unions in Derbyshire, and for Hertford, Hatfield, St. Alban's, and Hitchin unions in Herts. At these meetings the questions asked in the Commissioners' circulars of inquiry, especially those which have reference to legislative restrictions on the labour of children, were fairly discussed by intelligent employers of labour, with what result will be seen when I review the evidence, as it serves to answer the different subjects of inquiry.

To such persons as I had reason to believe would give me reliable information I issued circulars of inquiry, adding to the questions asked in the shorter circular forms for school or labour returns, or questions as to the mode of hiring and paying labourers, according to the occupation of the intended witness.

I find that in each county I issued about 35 circulars, and that of these I have had returned from Derbyshire 29, and from Herts 28, in all 57, of which 13 have been returned by clergymen for their respective parishes, 18 by landowners or their agents, 23 by occupiers of land, usually also guardians for their parishes, and 3 by other persons.

The remainder of the evidence, which includes that of 5 surgeons and 8 relieving officers, is chiefly taken from my note book as it was written down at the time of my interview with the persons who gave it.

Tabulated labour returns.

3. The tabulated labour returns show the whole ordinary staff employed on 3,899 acres, included in 13 farms in Derbyshire, and on 8,993 acres, included in 18 farms in Herts. These tables also show what proportion of labourers, male and female, whose ordinary occupation is that of farm labourers, are thrown out of work in winter.

School returns.

4. The table of school returns for Hertfordshire gives the number of children on the register and in average attendance in 7 rural parishes.

I distributed as many forms for school returns in Derbyshire as I did in Herts ; but, owing chiefly, I suppose, to the difficulty of separating children of the agricultural labouring class from those of the mining and manufacturing class, only 2 returns were made, and these are given at the end of the evidence from the parishes to which they refer.

Although I should have been glad to have put in evidence school returns from more of the parishes in Derbyshire where agricultural work forms the chief employment of the labouring class, there is abundant evidence to show to what extent farm labour interferes with school attendance. It will be seen that this interference as regards children under 13 years of age is chiefly confined to an irregularity of attendance during spring, summer, and autumn, and that boys under that age are rarely employed throughout the year.

Condition of the agricultural labourer in Derbyshire is favourably affected by demand for mining and manufacturing labour.

5. The condition of the agricultural labourer in Derbyshire contrasts very favourably with that of his fellow labourer in Herts, or in any of the four counties of the South Midland district which I have previously inspected.

The great cause affecting favourably the position of the agricultural labourer in Derbyshire is the ever-increasing demand for mining and manufacturing labour, which keeps up a continual drain on the labour market and constantly tends to raise the wages of those who are content to till the ground.

In my report on Oxfordshire and Berks I alluded to the absence of mining and manufacturing industry as one of the apparent causes of "local congestion" of the labour market ; and I think there can be no doubt that the farm labourer of Derbyshire owes a good deal of the comparative comfort of his position to the geological formation of his native county.

Under ground lie coal, iron, lead, lime, and gypsum, and over the surface run streams, which put in motion our earliest cotton mills.

In his essay on the Farming of Derbyshire (Royal Agricultural Society's Journal, 1853), Mr. J. J. Rowley says,—

"Towards the close of last century a new element was introduced amongst the wilds of the Peak, which exerted a mighty influence on the character of North Derbyshire : Arkwright had realized his great invention and introduced the cotton trade. Taking advantage of its streams and waterfalls, cotton mills began to occupy the most sequestered places, the Wye and Derwent put thousands of spindles in motion. These factories brought a population, wealth increased, both agricultural and manufacturing, and gave a stimulant to improvements of every kind. Progress became the rule, agriculture and manufactures joined hands."

The chiefs of the cotton mills are now amongst the largest and most improving landowners of the county, and though their mills still find employment for a large number of hands, especially for the youth of both sexes, iron, coal, and lead are more active causes in keeping up a healthy demand for the services of an increasing population.

J. 2.

6. Towards the south of the county the demand for mining and manufacturing labour is less felt and wages give way; the only corrective influence, if corrective it may be called, being the winter employment in the Burton breweries of men whose ordinary avocation is farm labour.

Effect of winter employment in Burton breweries.

This winter employment at Burton, occurring at a time of year when, especially in a grazing country, farm work is short, would have the best possible effect, if it was not that it is accompanied by an education in beer drinking. Mr. S. Faulkner, occupier and guardian of Scropton, gives, I think, a fair summary of the evidence on this head, where he says (see Derbyshire evidence, 38),—

"If it was not for the beer, the winter work supplied by the Burton breweries would be a blessing to our labourers, who sometimes cannot find work in winter."*

Agricultural economy of Derbyshire.

7. Besides the demand for mining, manufacturing, and beer-making labour, there are, however, other peculiarities and customs of the county influencing the position of the labourer, which will be best explained by giving a slight sketch of its agricultural economy.

In the first place, Derbyshire, unlike Herts or any of those which I have previously inspected, is a grazing county, and the number of agricultural labourers proper is still further reduced by the fact that farms are generally small and are, many of them, held by a class of men whose families do a large share of the farm work.

Of the 473,000 acres accounted for in the "Agricultural Returns" for 1868, 138,000 are arable and 335,000 permanent pasture, exclusive of heath, mountain land, and waste, which are credited with about 186,000 acres.

Nor is the large proportion of permanent grass a thing of recent creation, or dependent in any way on the cost of labour. It is the natural result of the climate and geological formation.†

The carboniferous limestone and millstone grit district, which extends over upwards of 300,000 acres towards the west and north of the county, is well adapted for dairy farming and the summer grazing of young stock, and few farms possess any larger proportion of arable land than serves to provide winter keep and litter for cows. There are large farms on the higher elevations of these formations almost exclusively devoted to the summer grazing of young stock, and requiring very little manual labour.

A large proportion of the surface of the coal measures which covers about 150,000 acres presents no very inviting aspect to the eye of a farmer intent on growing an alternation of corn, clover, and roots, although on the coal measures, where wages are highest, are to be seen well-cultivated farms (such as Mr. Crawshaw's at Staveley) having a fair proportion of arable land.

A large proportion of the clays and marls of South Derbyshire, owing probably to deposits from the more elevated limstone district, has obtained such fame as grazing land that it can create no surprise that it remains uninjured by the plough. Notwithstanding a dryer and warmer climate only the lighter land in this district is used for growing corn.

There remains then only some 20,000 acres on the magnesian limestone where one would expect to see much arable farming, and here you find it in spite of high wages, a somewhat elevated situation, cold climate, and not very gifty soil.

Wages and hiring in Derbyshire.

8. Some examples from the evidence which I received on the mode of hiring and rate of wages will serve further to explain how the pecuniary position of the Derbyshire labourer compares with that of the South Midland labourer.

Beginning with the neighbourhood of Bakewell, which I chose as my chief point for inquiry in North Derbyshire.

Mr. H. P. Bagshawe, relieving officer, after saying that "labourers wages average 2*s.* 6*d.* a day," (Derbyshire evidence, 7) gives the following example of payment to a married farm servant:—

"12*s.* 6*d.* a week wages, a quart of new milk per day worth 2*d.*, a house and garden and manure, from 300 to 400 yards of potatoes, leadage of coals from the pit, about half food and beer in haytime."

Taking the cottage and garden and manure at 1*s.* 6*d.* a week, this wage is at least worth 16*s.* a week.

As to the consumption of coal, Mr. Bagshawe says,—

"Coals are cheap, from 6*s.* to 6*s.* 6*d.* a ton at the pit, and from 9*s.* to 10*s.* 6*d.* at the station. With tolls, if the farmer leads them, coals will cost a labourer from 7*s.* 6*d.* to 8*s.* 6*d.* a ton at his door, and a ton will last him an average of eight weeks.

I wonder what a labourer on the Berkshire downs, who has a ton of coal led for him valued at 25*s.* by his master, would think of a fellow labourer who consumed six tons in a year; or what his wife would say if she could have a quart of new milk per day for her children.

---

* The following is some of the additional evidence as to the effect of the employment in the Burton breweries,—

Mr. John Shaw, relieving officer (Derbyshire evidence, 33), says:—

"The winter employment in Burton helps to keep up wages, especially for hired single men; I don't think the beer allowance of the breweries does so much harm as is usually attributed to it. At the breweries they give labourers 13*s.* a week and a quart to three pints of beer per day."

Employment in Burton breweries.

Edwin Dicken, labourer (Derbyshire evidence, 36b), says:—

"A good many men go to Burton in the winter, where they get 13*s.* a week and beer, and many of them would be out of work in winter if they didn't get work at Burton in the breweries, and if it wasn't the beer it would be a good job for them to get work there, but it spoils some of them getting to drink so much beer."

Mr. J. Hudson, occupier, Hilton (Derbyshire evidence, 37a), says:—

"Some labourers from about here go to Burton in the winter; they get no higher wages than we give, but as much beer as they like, and about three years kills them."

† According to Farey's Report, which gives the area of the county as 622,080 acres, instead of 658,803, as given by the Ordnance Survey, the area covered by the different geological formations is thus given:—

	Acres.
Clays and marls of South Derbyshire - - -	158,000
Yellow lime (magnesian limestone) - - -	21,580
Millstone grit shales - - - - -	220,500
Mountain limestone with toadstone - - -	92,000
Coal measures (with iron) - - - -	130,000
	622,080

J. 2.

9. Returning again to the evidence on wages, Mr. Greaves, a large occupier in Bakewell parish (see evidence, 11), pays his men 14*s.* a week upstanding wages, and 8*s.* a week in addition in lieu of food and beer for eight weeks certain in hay and corn harvest, i.e., an average of about 15*s.* 3*d.* a week for the year.

10. Mr. Young, an occupier in Bakewell parish, after describing (see Derbyshire evidence, 11a.) his cowman's and shepherd's wages at 16*s.* a week, and his ploughman's, including allowances (also stated in detail), as worth 17*s.*, says:—

"All my other labourers have 14*s.* a week at all times except harvest, when they take cutting corn and hay by the acre, and average about a 1*l.* a week for eight weeks; they also take up turnips and potatoes by the piece."

11. Mr. Lawrence Furniss, another occupier in Bakewell, which is a very large parish, says (see Derbyshire evidence, 11b.):—

"I board and lodge three men, to whom I pay an average of 16*l.* a year. A lad of 15 has 10*l.*

"I consider these men much better off than labourers living on their own account. Such men may save 10*l.* a year, and some of them do. A man has just left me who has saved 100*l.*, he is looking out for a farm.

"The men we have in the house are cattle or horse men. When such a man is boarded out he gets from 8*s.* to 9*s.* for board. The men we keep are the best labourers, a good deal, because they are best fed.

"Labourers who live at home have from 12*s.* to 14*s.* a week, but any good labourer can command 14*s.* As soon as we commence cutting hay it is customary now to pay 1*l.* a week, and give from two to three quarts of beer per day, this would last for four weeks, and there would be the same wage for four weeks in harvest on our farm."

12. Thomas Wilson, labourer, Chatsworth (Derbyshire evidence, 14c.), says:—

"Labourers under the Duke have 14*s.* a week; farmers sometimes pay more, but the work is not so constant." *

13. Mr. J. Young, agent to Colonel Leslie (Derbyshire evidence, 15), says:—

"Labourers wages are 2*s.* 6*d.* a day, though in summer good men get more, up to 3*s.*; still secondary men you may get for 15*s.* a week at any time of the year."

14. For Chapel-en-le-Frith union, Mr. Samuel Turner, bailiff to the Duke of Devonshire, says (Derbyshire evidence, 18):—

"Farms in this district are small, and few farmers keep more than one serving man, who is lodged and boarded in the house, and has from 16*l.* to 18*l.* a year, hired from Christmas at statute fairs.

"Where a farm servant does not lodge in the farmhouse he gets 10*s.* to 12*s.* a week and his meat."

15. For Chesterfield union, Mr. M. F. Mills, land agent, says:—

"The ordinary rate of wages is 15*s.* a week: unmarried men living in the farmer's house and hired by the year have from 10*l.* to 20*l.* and their food; 16*l.* would be about the average of full men."

16. The following are the wages in money and kind paid to two ordinary farm labourers examined by me on Mr. Crawshaw's farm near Staveley:—An upstanding wage of 16*s.* a week, three pecks of potatoes planted for them, extra pay in harvest, and a good cottage and garden let to them by their master at 1*s.* a week. Cottages such as these men occupy (which belong to the Duke of Devonshire) would in Staveley parish command a rent of 2*s.* 6*d.* a week; but putting the value of the cottage and garden at 1*s.* 6*d.*, I think the wages of these men are worth about 18*s.* a week.

The following is Mr. Crawshaw's account of the rate of wages (Derbyshire evidence, 21):—

"Hired servants from 14 to 20 years of age get from 8*l.* to 20*l.* per annum. The rate of wages for day labourers is on an average 15*s.* per week, for horsekeepers, who have longer hours, 18*s.*, and a foreman makes about 1*l.* This is *exclusive* of any extras; they make in harvest abont 40*s.* extra, and in piecework generally, such as hoeing turnips, &c., they make extra wages; they have also potatoes grown for their own consumption, the farmer finding land, manure, and labour, the man only seed, and coal carted free of charge."†

17. Passing now to the south of the county, Mr. Robert Spendlove, relieving officer, Belper union, says (Derbyshire evidence, 25):—

"Agricultural labourers in my district average 10*s.* a week and their food."

18. Mr. E. Harrison, agent for an estate which lies chiefly in Belper union, says (Derbyshire evidence, 27a):—

"Labourers wages are from 15*s.* to 16*s.* a week."

19. Mr. T. Travis, an occupier also in Belper union, says (Derbyshire evidence, 30):—

"I have three men who get their meat in my house and sleep at home; they have 9*s.* a week, except for 14 weeks in summer, when they have 13*s.* a week, their meat, and two quarts of beer per day. I consider the men's meat worth at least 7*s.* a week."

---

* This man, as is the case with several of the Duke of Devonshire's labourers, has eight acres of grass and keeps two cows, and any labourer may put a cow for 21 weeks in summer into Chatsworth park at a charge of 3*l.*

Mr. Crawshaw's farm at Staveley.

† Mr. Crawshaw, who farms 480 acres, of which 240 are arable in four-course husbandry, with the exception of the stiffest part of the arable land, of which a portion equal to about 20 acres per annum remains in clover seeds for two years, employs a staff of seven adult men and two lads between 16 and 18 years of age. Mr. Crawshaw's explanation of how he keeps his farm in the high state of cultivation in which I saw it, with what would strike a southern farmer as so small a staff of labourers, is as follows:—

"I never grow couch grass, though at one time some of the land grew little else, and I always take advantage of labour-saving implements, that, together with good active horses in good condition and well-paid men, is the only reason why in this district we, as a rule, can do with less labour numerically than is the case in some parts of the country. I may sum up as follows:—We manage the land so as to distribute the labour as evenly through the year as possible; we use all the best machinery to economize labour; we keep good horses and pay high wages; and, as a consequence, we can command good men."

Mr. Crawshaw's adult labourers cost him an average of 18*s.* a week; the two lads are boarded with the foreman at 11*s.* a week each and receive 12*l.* wages. On this farm you have an example of good cultivation, where neither women nor children are employed, and where adult male labourers earn 18*s.* a week, of which 16*s.* a week is an upstanding day-work wage. One point not mentioned by Mr. Crawshaw is, that his labourers reside on his farm; and there is another point which I am afraid you must take at my valuation, and which is, that his rent is as high as such land would command in the southern counties.

20. Mr. Joseph Brookes, bailiff to Mr. Smedley, a large occupier in the same parish as Mr. Travis, says (Derbyshire evidence, 30a) :— J. 2.

"We hire carters by the year from the 12th of May, and pay them 15*s.* a week, and give them a cottage free, say 16*s.* 6*d.* a week. Sometimes these men have piecework in harvest for a week or so; we have three such men.

"Able-bodied day labourers we pay 14*s.* a week in winter and 16*s.* a week in summer. In harvest they earn about 1*l.* a week for a month; we have 10 such men. An old man has 10*s.* and a boy of 15 has 9*s.* a week."

21. Mr. John Shaw, relieving officer, Burton-on-Trent union, says (Derbyshire evidence, 33) :—

"Young men are usually hired by the year, and live in the farmer's house: lads begin about 12, and get about 4*l.* a year; men get from 12*l.* to 16*l.*

"Married men, who are hired by the week and board at home, get about 14*s.* a week on an average for the year. In winter wages drop to 12*s.* a week, in hay time and harvest they rise to 15*s.* or 16*s.*, and in spring and autumn they vary from 13*s.* to 14*s.*

"Some weekly servants board in the farmer's house, and get about 8*s.* a week in winter and 10*s.* a week in summer; the board is worth 5*s.* to 6*s.* a week, and the man himself is better off and better fed, but his family suffers, having only the 8*s.* or 10*s.* a week to live on."

22. Mr. T. S. Radford, occupier in Burton union, says (Derbyshire evidence, 35) :—

"I hire waggoners by the year, Michaelmas to Michaelmas, at from 12*l.* to 14*l.* a year and their keep. Men keeping themselves and not hired by the year have 14*s.* a week for 39 weeks, and 16*s.* for 13 weeks in summer, when they also have luncheon and supper and beer, if working long hours; I also give my men 300 yards of a drill of potatoes."

As an example of how wages fall off as the demand for labour other than agricultural falls off, Mr. Radford, who also occupies a farm at Cole Orton (a few miles further south), in Leicestershire, says :—

"At Cole Orton I pay 13*s.* a week throughout the year, and 1*l.* for Sunday work, giving the same potato ground."

i.e., ordinary labourers at Cole Orton receive 1*s.* 6*d.* a week for the year less wages than labourers at Church Broughton under the same master. Mr. Radford, however, pays higher wages than some farmers in his immediate neighbourhood.

23. Mr. S. Faulkner, for instance, says (Derbyshire evidence, 38) :—

"Our labourers have 13*s.* a week for day-work for 39 weeks, and 14*s.* for 13 weeks in summer; these men also get piece-work, earning by mowing and shearing, say 4*s.* a day."

Summary of evidence on wages for different classes of farm labourers in Derbyshire.

24. These are examples of the rate of wages in different parts of the county, and when compared with other evidence on the same subject, such as is given in Derbyshire evidence, 6, 9, 12, 14a, 14b, 19, 23, 31, 36a, 36b, they appear to me to show that the average weekly wage of an ablebodied farm labourer in Derbyshire, who is able to work throughout the year, varies from 14*s.* to 17*s.*, being highest in those districts (as on the coal measures) where mining and manufacturing labour is in most demand. Throughout the greater part of the county any ablebodied labourer can command an average weekly wage of 15*s.*, and in almost every instance which came under my notice a farm labourer proper would have, in addition to the above wage, about 300 yards of a drill of potatoes planted for him.

25. Owing no doubt to the absence of cottages attached to the farms in a county where villages are not very frequent, and to the prevalence of small farms, a large proportion of the unmarried labourers are boarded and lodged in their master's houses. These men are hired for the year at statute fairs and receive from 12*l.* to 18*l.* wages, 14*l.* in the south and 16*l.* in the north of the county being the ordinary wage of an able man.

26. As will be seen from the evidence, where cottages are not conveniently placed, married men occasionally receive their food in the farmer's house and sleep at home; such men usually (see Derbyshire evidence, 30 and 33) receive 9*s.* a week in money, and taking the value of the food at 6*s.* a week, their wage is worth 15*s.* a week. There can, I think, be little doubt that these men, as is pointed out in the evidence, are themselves better off than if they found their own food, but that their families are apt to suffer; too large a proportion of the wage is in fact consumed in feeding the head of the family.

27. Of the classes of labourers I have named those who save money are the unmarried hired servants. A man of that class receiving 16*l.* a year out of which he has only to provide himself with clothes, will not unfrequently save 10*l.*, and if after a few years of such saving he is fortunate enough to marry a dairy-maid who can bring to his aid her savings and experience he is in a position to occupy a small dairy farm, or a cottage with grass land enough attached to keep two or three cows which his wife can manage leaving him to pursue his calling of farm labourer and the certain return of 15*s.* a week, rather than try the chances of a small farmer.

In comparing the earnings of the Derbyshire labourer with those of the labourer in the corn counties of the South Midland district, it is important to bear in mind how large a proportion of his earnings are an upstanding wage for day work. Of the 15*s.* a week which he can command in the greater part of the county as an average for the year, 14*s.* represents what he would earn by day work alone.

28. Boys where employed by farmers other than their own parents begin regular work at from 12 to 13 years of age at a wage varying from 4*s.* to 5*s.* a week.

29. Women (chiefly married) who are employed in out-door farm labour, as in South Derbyshire, receive ordinarily 1*s.* a day for eight or nine hours work. Dairy maids, who can take charge of a dairy are in great demand throughout the county. On large farms their wages occasionally reach from 18*l.* to 20*l.*, and 14*l.* is a common wage for an efficient dairy woman.

Agricultural economy of Hertfordshire.

30. Hertfordshire, unlike Derbyshire is naturally a corn county, possessing a warm and dry climate and presenting to the farmer the same variations of soil which he meets with in Berkshire and in the southern portions of Oxfordshire, Bucks, and Beds. Gravel and loam on chalk covers a large portion of the north and west of the county, while towards the borders of Middlesex the farmer finds his most useful soil to consist of a mixture of London or plastic clay and sand. Towards the borders of Essex some fertile land is apparently composed of the drift of sand, clay, flints, and chalk.

J. 2.

According to the "Agricultural Returns" for 1868 permanent pasture reckons for only 88,000 out of the 330,000 acres accounted for, which is about the same proportion as on the 8,900 acres to which my Labour Returns (see Herts evidence, Table A) refer. As the amount of labour performed on the farms by the farmer himself is small, an approximation to the number, ages, and sexes of all persons employed in Hertfordshire may be formed from these tables.

Natural increase of population not provided for as in Derbyshire.

31. Unlike Derbyshire too, Hertfordshire which employs a much larger agricultural population affords very little other employment to carry off the natural increase of that population. The proximity of London, no doubt, has a tendency to raise wages especially by absorbing young men and women as domestic servants, but the slightness of the effect has always astonished me, and I cannot but think that the ignorance of the labouring class in the counties bordering upon the great city have allowed her wants to be supplied from more distant sources.

Wages in Herts.

32. The day-work wage at the time I was in Herts was said, as will be seen by the evidence, to vary from 10*s.* to 12*s.* a week for ordinary day-men.

My own inquiries on this subject were confined to the Unions of Hertford, Hatfield, St. Alban's, and Hitchin, and I cannot say that I found any instance of an able-bodied labourer receiving a less wage than 11*s.* a week for day work, though I have no doubt that towards the north-east of the county such instances might be found.

The prevailing wage for day work had been 11*s.* a week since the harvest of 1868 before which it had stood at 12*s.* How far this represents the earnings of a fairly industrious man will be seen from the following examples of evidence, which distinctly confirm the evidence on wages and earnings which I have had the honour of laying before you from the counties of Bedford, Buckingham, Oxford, and Berks, where the means of adding to the day work wage are almost the same as in Herts.

33. Mr. D. Peck, Relieving officer of Watton district in Hertford Union, says Herts evidence, 6) :—

"The wage for day work just now in the north of my district is 11*s.* a week, towards Hertford it is 12*s.*; this was the rate of wage during last winter; if bread was dearer the farmers would probably raise the wages 1*s.* a week. Besides farm piece work such as harvesting, mowing, hedging and hoeing corn and turnips, men get piecework in the woods, barking and cutting faggots. An average able-bodied labourer ought to make from 13*s.* to 14*s.* a week for the year round, when the day-work wage is at 11*s.*

"Our labourers have neither pig, nor cow, nor poultry, when they are thrown out of work they come immediately on the rates, all they think about when they have money is drink. In harvest men can earn 24*s.* a week, and they seem no better during that season than any other, they drink the difference and get ill on it."

34. The following account of the earnings for 12 months ending May 1st 1869, of 15 men employed by Mr. J. C. Allen, a large occupier in Hertford Union, was kindly extracted for me from Mr. Allen's labour-book (Herts evidence, 11a.)

Name and Description of Labourer.	Earnings for 12 Months.			Average per Week.		
	£	*s.*	*d.*	£	*s.*	*d.*
1. Collins, bailiff, formerly labourer	74	0	0	1	8	5¼
2. Bush, working bailiff, formerly labourer	54	12	0	1	1	0
3. Chapman, works on the farm and drives the engine, formerly day labourer.	54	12	0	1	1	0
4. Edwards, gardener, formerly labourer	48	2	0	0	18	6
5. Pike, groom, formerly labourer	44	4	0	0	17	0
6. Smith, shepherd	43	5	0	0	16	7½
7. Young „	40	3	8	0	15	5
8. Milton, labourer, and feeds thrashing machine.	40	0	2	0	15	4½
9. Tyler, labourer, and thatcher	39	15	1	0	15	3½
10. Cakebread, common labourer	38	0	9	0	14	7½
11. Hollingsworth, „ „	37	1	7	0	14	3
12. Milton, „ „	36	6	6	0	14	0
13. Tyler, „ „	36	6	6	0	14	0
14. Peddell, horsekeeper	37	12	6	0	14	6
15. Warford, „	34	15	6	0	13	4½

This table besides giving the earnings for ordinary farm labourers, such as numbers 10, 11, 12, and 13, for 12 months, shews the positions of higher trust at higher wages which are open to industrious labourers on large farms.

Numbers 10, 11, 12, and 13 were not picked men, but represent the average of about 20 men of that class employed by Mr. Allen. They average as will be seen 14*s.* 2½*d.* per man.

Immediately after the harvest of 1868 the day-work wage was dropped (in consequence of the fall in the price of bread) from 12*s.* to 11*s.* a week, so that the earnings of these ordinary labourers exceed the average day work wage (11*s.* 6*d.*) by 2*s.* 8½*d.* per week.

You will observe how closely this addition answers to that of the same class of men in the examples I quoted in my report on Oxfordshire and Berks.

Summary of evidence on men's wages in Herts.

35. Other evidence on the question of wages will be found in Nos. 9, 11, 11b, 13a, 15b, 19, 22, 23, 23b, 27, 29, 31, 32, 33, 34 Herts evidence, and the result of it appears to me to be this, that the day work wage while I was in Herts varied in different parts of the county from 10*s.* to 13*s.* a week, being usually 11*s.* a week, and that the average addition to this wage for the year in the case of an able-bodied man in full work would be about 2*s.* 6*d.* a week.

36. Yearly hiring for farm servants is almost unknown in Hertfordshire, but as will be seen from table 13 of the labour returns a very small proportion of the adult labourers whose ordinary employ-

ment is farm labour are thrown out of work in winter. My returns give 285 men employed in winter as against 286 in spring, 289 in summer, and 288 in autumn on the same acreage. J. 2.

37. Supposing then that a Derbyshire labourer earns an average of 15*s.* a week and a Herts labourer an average of 13*s.* 6*d.*, is the difference of 1*s.* 6*d.* a week sufficient to account for the difference of the comfort displayed in the surroundings of the former as compared with the latter? Is this difference of income sufficient to account for the fact that the Derbyshire labourer feeds himself and his family better and keeps his children longer at school, and that in parts of Derbyshire where this wage prevails women have almost ceased to work in the fields? Wages and earnings in Derbyshire and Herts compared.

Eighteenpence is no doubt a great addition to a weekly income of 13*s.* 6*d.*, but eighteenpence, though the difference in the earnings of the heads of families, by no means measures the difference of the sum at the disposal of the family. In the one case the upstanding wage irrespective of piece-work or temporary additions is 14*s.*, in the other 11*s.*, and these are the sums for which the labourer usually accounts to his wife and family.

The additions by piece-work in Herts are as 2½ to 1 compared with Derbyshire, and I have very little doubt that the expenditure in self-indulgence, chiefly in beer-drinking, on the part of the Herts labourer, is as 2½ to 1 compared with that of the Derbyshire labourer.

38. Piece-work wages no doubt recommend themselves to every employer as the easiest means of allowing industrious men to profit by their industry, and economically they appear to be the only possible mode of payment with such a class of men as constitute the bulk of South Midland labourers, but piece-work in agriculture often implies physical injury to men ignorant of the best means of maintaining their working power, and a variable income with its many temptations. Piecework wages.

The remedy for this state of things does not appear to me to be to discourage piece-work, but to teach the labouring classes to be thrifty of their strength as well as of their money.

In the Derbyshire evidence, especially that given by relieving officers, you will see how often the treatment of their families by farm labourers is compared favourably with that of the labourers in other branches of industry earning much higher though not so regular wages, and here again is an evidence of the effect of variable incomes in the hands of uneducated men.

39. As an example of how boys of 10 or 12 years can contribute to the family income in Herts take the evidence of Mrs. Fitz-John (Herts evidence, 11*b.*), who says,— Earnings of boys in Herts.

"My husband is a farm labourer; he has 12*s.* a week. We have five children; the two eldest are boys, 10 and 12 years old, and they are at work, minding cattle and sheep; they get 2*s.* 6*d.* and 3*s.* a week now, but they will be out of work in winter."

40. Boys under 10 years of age employed chiefly in spring and autumn receive from 1*s.* 6*d.* to 2*s.* 6*d.* a week.

41. Ploughboys, who are employed throughout the year, and at an earlier age in the north than in the south of the county, receive from 3*s.* to 5*s.* a week, according to their age and strength; 4*s.* a week would about represent the wage of an active boy of 13.

42. In the straw-plaiting district, and towards the south of the county generally, except in hay time and harvest, very little farm work is done by women. Where they are more generally employed their day-work wage for eight hours' work varies from 9*d.* to 10*d.*, rising to 1*s.* a day in hay time, and 1*s.* 6*d.* a day in harvest: 19 out of the 21 women returned to me as more or less regularly employed in farm labour are married (*see* Table B., Herts evidence). Employment of women in Herts.

43. In those portions of western Herts which lie within, say, a dozen miles of Luton (the metropolis of plaiting) most of the young women and many of the older ones, besides children of both sexes, earn their livelihood by plaiting straw. There has been very little change in the position of the plait trade since I reported on the condition of persons employed in it in Beds and Bucks, and I have nothing to add to what I then said as to the effect of this trade on the morals and domestic habits of those engaged in it. Straw-plaiting.

Two examples of evidence on the subject of plaiting will show that some of the evil effects of this trade, which I pointed out in my former Report, still exist.

Mr. W. N. Sladden, relieving officer for Hatfield union, says (Herts evidence, 17),—

"In half of this union the women and girls plait straw, boys generally go to field work.

"1. The female plaiters are very useless for all domestic work; they can't even put a patch on their husbands' clothes, and they can't earn more than an average of 2*s.* a week just now where they have families.

"2. The guardians do all they can to discourage plaiting, and try to get the parents to send their girls to service. In the workhouse the matron prepares the girls for domestic service, and many have succeeded well."

In answering the question in the Commissioners' circular of inquiry which refers to the state of education, the Board of Guardians for Hitchin union say (Herts evidence, 28),—

"In consequence of the employment of children in plaiting, and also the indifference of their parents to the value of education, there is much neglect in sending children to school. There are plaiting schools in most of our parishes, to which children are sent from 3 years old. In many of these neither reading nor writing is taught, the object being to extract a large amount of work from the children. These greatly interfere with the attendance at the educational schools."*

Private gangs.

44. Passing now to a review of the evidence, as it serves to answer the questions asked in the Commissioners' circulars of inquiry: I found no evidence of the existence of gangs in Derbyshire. In Hertfordshire private gangs, or parties of adult women, are here and there employed in weeding corn, hoeing turnips, &c.; and gangs of boys under a foreman are employed by some farmers, chiefly in pulling charlock or in other light summer work. I see no reason for subjecting such private gangs to legislative interference other than such indirect interference as would be caused by educational restrictions, which might limit farm labour to children above a certain age or demand a certificate of ability to read and write before allowing a child to be employed. Private gangs.

* During the discussion, Mr. Pollard, one of the guardians present, said, "He thought they should mention in their answer that "the plaiting schools are most unwholesome; ventilation is bad and the health of the children suffers by preserving a high "temperature on the ground 'that it makes the straw work better.'"

General Farm Employment.

J. 2. Derbyshire labour returns.

45. The following is a return of the labourers, male and female, employed during the spring quarter on 13 farms in Derbyshire, extending over 3,899 acres, of which 1,058 are arable and 2,841 in permanent pasture:—

	Number of Farms.	Acres Arable.	Acres Pasture.	Total Acreage.	Males.						Females.						
					Under 8.	Between 8 and 10.	Between 10 and 13.	Between 13 and 18.	Over 18.	Total Males.	Under 8.	Between 8 and 10.	Between 10 and 13.	Between 13 and 18.	Over 18. Married.	Over 18. Unmarried.	Total Females.
North Derbyshire -	8	743	1,843	2,586	—	1	—	11	36	48	—	—	—	—	1	2	3
South Derbyshire -	5	315	998	1,313	—	—	4	7	25	36	—	—	1	5	11	5	22
Totals -	13	1,058	2,841	3,899	—	1	4	18	61	84	—	—	1	5	12	7	25

46. I have separated the returns for North and South Derbyshire, in order to show how small an element in the farm economy of North Derbyshire the labour of females and children under 13 years of age is.

Variation in staff of farms during four quarters of the year.

47. The following Table shows how the ordinary staff of these 13 farms, omitting extra hands in hay time and harvest, varies during the different seasons of the year:—

Employment on 13 Farms in Derbyshire covering 3,899 acres.	Males.						Females.						
	Under 8.	Between 8 and 10.	Between 10 and 13.	Between 13 and 18.	Over 18.	Total Males.	Under 8.	Between 8 and 10.	Between 10 and 13.	Between 13 and 18.	Over 18. Married.	Over 18. Unmarried.	Total Females.
In Spring - - -	—	1	4	18	61	84	—	—	1	5	12	7	25
„ Summer - -	—	—	4	19	63	86	—	—	1	5	14	7	27
„ Autumn - -	—	1	4	18	61	84	—	—	1	5	10	3	19
„ Winter - -	—	—	4	18	56	78	—	—	1	5	8	3	17

Extra hands in hay-time and harvest.

48. It will be well first to dispose of the item "extra hands in hay time and harvest," which I think one or two quotations from the evidence will do most satisfactorily.

Mr. Daniel Roberts, bailiff to the Duke of Rutland, speaking of the neighbourhood of Bakewell, says (Derbyshire evidence, 9),—

"Women do no farm work now, not even in hay and corn harvest. Upwards of 20 years ago women were a good deal employed in twitching, cleaning turnips, and other light work; now hay-tedding and mowing machines and reaping machines have entirely taken the place of female labour, and provided for an increasing deficiency of male labour in hay time and harvest. Formerly a great many Irish labourers came, but their number is greatly diminished; not one-half come now of the number who used formerly to come, and without mowing machines we should have a great difficulty to get through our hay-cutting. Irish labourers who do come, come here for hay time, then go further south, where harvest is earlier, and come back for our late harvest, and then go to Lancashire for potato-picking."

Mr. Wm. Greaves, also speaking for the neighbourhood of Bakewell, says (Derbyshire evidence, 11),—

"We have a good supply of labour, and they are employed throughout the year. Our extra men are generally Irish, who have been in the habit of coming here early in June and staying to assist in hay-making, which is of great extent here. About the end of July they go forward to the corn counties. For the last three or four years they have not come as much as before, and in 1866 and 1867 we were much perplexed to get the grass cut and made. Mowing alone cost from 6*s.* to 8*s.* per statute acre. This has compelled us to have machines, and most farmers last year cut their grass with mowing machines."

49. Whatever causes may be in operation to diminish the number of Irish harvesters who visit England, and the diminution of their number has been the cause and not the effect of the greater use of mowing and reaping machines, the almost entire absence of women from the hay and corn fields of North Derbyshire appears to me to point to a great improvement in the pecuniary position of the labouring class.

Mr. M. F. Mill's evidence is very much to the point here, where he says,—

"All labour, mining and agricultural, has risen about 30 per cent. during the last 25 years."

Proportion of men thrown out of work in winter.

50. As is natural, however, on an acreage consisting chiefly of permanent grass, the quantity of adult labour employed is comparatively small, and a larger per-centage of men are thrown out of work in winter. The ordinary staff of the acreage I have given, which consists of 61 adult male labourers for three-fourths of the year, falls to 56 in winter, *i.e.*, about 9 per cent. of men whose ordinary occupation is that of farm labourers, are thrown out of work in winter, and it is fortunate that other sources of employment are open to them.

I have reason to believe that this per-centage of men thrown out of farm work in winter would have been greater if I had received returns from a larger proportion of small farms.

51. The returns made to me show an average employment of 1 man to 64 acres, of which somewhat more than one-fourth are arable.

Employment of boys in farm labour in North Derbyshire.

52. The eight labour returns from North Derbyshire, which are from farms averaging upwards of 300 acres, show that on such farms in that part of the county boys under 13 are not regularly employed in agriculture. The other evidence on this subject (with the exception of that given by the Rev. D.

Vawdrey, of which presently) fixes the age at which regular employment begins at from 12 to 13, except on small farms, where children are employed by their parents. Up to 12 or 13 children in North Derbyshire are only employed (as far as farm labour is concerned) in odd jobs, which may from time to time make their services useful in spring, summer, and autumn. J. 2.

53. The Rev. D. Vawdrey (evidence, 13), in answering the circular question for Darley parish, says,—

"Boys are employed in agriculture from 7 or 8 years old upwards. They are employed from March till September."

In an excellent letter (Derbyshire evidence, 13*a*), on the general condition of the agricultural labouring class, which he addressed to me, Mr. Vawdrey says,—

"Twenty years ago we had at school a large class of boys and girls, all of whom were above 13 years old. Now there are few of either sex, especially in the summer time, older if as old as 10. The boy at 6 nurses the baby or gathers manure, and the boy at 7 goes to the nursery garden to weed, and the instant the law permits them the rest are off to the flax mill at half time, in which condition their education is supposed to be provided for."

It is evident therefore, I think, that in answering the circular question Mr. Vawdrey had in his eye the employment given in the large nursery gardens at Darley rather than farm labour proper. Nursery gardening would no doubt be considered agricultural employment in any enactment placing legislative restrictions on such employment. Mr. Vawdrey, however, says:—

"No restriction is desirable for any purposes except for *educational*."

54. For South Derbyshire the returns for five farms, including 1,313 acres, of which about one-fourth are arable, make no mention of any child under 10 years of age, and give 4, or about 1 to 300 acres, as the number of boys between 10 and 13 years of age in regular employment. The remainder of the evidence from South Derbyshire on this subject shows that the regular employment of boys as farm servants begins, as in North Derbyshire, at from 12 to 13 years of age, and that irregular employment begins rather earlier in the south than in the north of the county. Employment of boys in South Derbyshire.

In point of fact, in the north of the county the parents are rather better off than they are in the south, and most of the boys after they are 12 or 13 years of age find employment other than agricultural.

55. In some of the parishes in Burton union I found that about one-third of the labourers' wives and a few unmarried women were employed on the farms in spring, summer, and autumn. In the north of the county female labour, except in connexion with dairy work, is now very little known to the farmer. I have already quoted Mr. Robert's evidence. Mr. H. P. Bagshawe, relieving officer of Bakewell union, says,— Employment of women in field labour confined to South Derbyshire.

"The women grumble if you ask them to do a bit of hay making."

Lord G. H. Cavendish, M.P., chairman of Bakewell union, says,—

"I have seldom seen women employed in the fields, except in making hay."

56. The following Table shows the whole ordinary staff for the four quarters of the year on 18 farms, extendlng over 8,933 acres in Herts, of which 6,742 are arable and 2,191 are in permanent pasture:— Hertfordshire labour returns.

18 Farms extending over 8,933 acres in Herts.	Males.						Females.						
	Under 8.	Between 8 and 10.	Between 10 and 13.	Between 13 and 18.	Over 18.	Total Males.	Under 8.	Between 8 and 10.	Between 10 and 13.	Between 13 and 18.	Over 18. Married.	Over 18. Unmarried.	Total Females.
In Spring	—	4	40	84	286	414					19	2	21
„ Summer	—	2	45	84	289	420	Exclusive of women who only work in hay time and harvest.				20	2	22
„ Autumn	—	4	39	83	288	414					20	2	22
„ Winter	—	2	37	83	285	407					18	1	19

57. It will be seen that the per-centage of males over 18 years of age who are thrown out of work in winter is very small, and that the number of such men employed (harvest excepted, as extra harvest hands were omitted from the returns) is almost the same throughout the year. This is of course a healthy state of things in a county where agricultural labour forms the chief employment of men and arises from the large proportion of arable land and active cultivation of the farms from which the labour returns were obtained.* Proportion of men thrown out of work in winter very small.

* Deducting Earl Cowper's and Mr. Abel Smith's farms, which contain a large proportion of park ground, the labour account for 16 farmers (15 of which are occupied by tenant farmers) stands thus—

Herts.	Extent of Farms.			Males.						Females.						
	Arable.	Pasture.	Total.	Under 8.	Between 8 and 10.	Between 10 and 13.	Between 13 and 18.	Over 18.	Total Males.	Under 8.	Between 8 and 10.	Between 10 and 13.	Between 13 and 18.	Over 18. Married.	Over 18. Unmarried.	Total Females.
16 farms	6,472	1,242	7,714	—	4	38	78	252	372	—	—	—	—	18	1	19

Showing an ordinary staff of—
One man to about 31 acres
„ lad „ 100 „
„ boy „ 180 „
} Where about five-sixths of the land is arable.

J. 2.

Employment of young men and boys in Herts.

58. One lad between 13 and 18 is employed for about 110 acres (of which about three-fourths are arable), and that continuously throughout the year.

59. Of boys between 10 and 13 one is employed to about every 200 acres of such mixed cultivation, and of these 6 or 7 per cent. are thrown out of work in winter, while there is an addition of about 10 per cent. to their number in summer.

60. Of boys under 10 very few are employed continuously through any one quarter of the year, and only one to above 4,000 acres is returned as employed throughout the year. You will observe how closely these labour returns resemble those given for Oxfordshire and Berks.

Employment of women and girls in Herts.

61. It will be seen from Table A., Herts evidence, how the employment of women varies in different parts of the county. In the plaiting district, *i.e.*, towards the west of the county and towards the south generally, very little field work is done by women, except in hay time and harvest. North of Ware and east of the line of the Great Northern Railway the employment of women, four-fifths of whom are married, becomes more common, and on two farms of about 1,000 acres each in that district the employment of women in light work in spring and summer averages 1 to 100 acres.

62. Girls are not employed in farm labour in any part of the county which I visited or from which I have received evidence.

Medical Evidence and Provision of Milk.

Legislative interference to protect children from physical injury is not necessary.

63. The medical evidence (which will be found in Nos. 2, 3, 4, and 5 of the Derbyshire evidence and No. 7 of the Herts evidence), when taken in conjunction with the evidence I have already referred to, will, I think, entirely justify my repeating what I have already said for the counties I have previously reported on, "*That legislative interference for the sake of protecting children from physical injury supposed "to arise from the manner in which they are employed in farm labour is not necessary.*"

Derbyshire neck and provision of milk.

64. I need, however, I think, make no apology for quoting at length part of the evidence given by Mr. E. M. Wrench, a surgeon in practice in Bakewell union in Derbyshire, which refers to a malady (goitre or Derbyshire neck) peculiar to a certain district in that county, and shows his estimate of the value of a good supply of milk to the children of the labouring class.

Mr. Wrench (*see* Derbyshire evidence, 2) says,—

"The health of the agricultural labourer and his family is very good, and has much improved lately, from better cottage accommodation and water supply, though much remains to be done."

"The Derbyshire neck is not nearly so common as it used to be. It is, as far as I can ascertain, after careful inquiry, attributable to defective nutriment, perhaps monotonous diet, and *not*, as is commonly supposed, to the limestone water or repeated intermarriage. The largest family of cretins in this neighbourhood occurs in one where a very well-to-do farmer's daughter ran away with a labouring man, and where there was not the slightest consanguinity.

"The food of the agricultural labourer has much improved since the introduction of railways, by the substitution of wheaten bread for oat cake. Milk, in the summer or cheese season, is very scarce, but at other times is pretty plentiful and easily procurable, with great advantage to the women and children.

"It is the custom of some of the landlords, most especially his Grace the Duke of Devonshire, to allow the labourers to rent enough grass land to keep one or two cows, with the greatest advantage to the labourer, by aiding his wages (which average 14*s.* a week), and inducing thrift to his wife by affording her more employment, and to the children by providing them with milk for nearly half the year, when there is no cheese-making.

"The labourers form small clubs, each member of which has the milk of all their cows in turn, and by these means each family is able to make one or two good cheeses every week or ten days. The beneficial result of the labourer keeping his cow is wonderfully exemplified in the health of the children of Baslow, where, out of a population of over 900, the deaths under 10 years of age (including those who only lived a few hours from birth) has averaged less than 3 per annum for the last 10 years, or at the rate of 3·103 per 1,000.

"I need scarcely say that this preservation of infant life would be our destruction were it not for the constant exodus of our young people to the neighbouring large towns for work, for which their good education and healthy frames eminently fit them.

"The labourer's cow again being of use in affording a little capital to enable the parents to apprentice their children to lucrative trades, or to send them to the colonies, where their practical knowledge of cattle is most useful."

65. The Rev. D. Vawdrey, rector of Darley and vice-chairman of Bakewell union, on the same subject or subjects (Derbyshire evidence, 13a), says,—

"Goitre is an evil incident to this locality, so extensive and so mischievous that no report of the hilly districts of Derbyshire would be complete without some reference to it. There is a great deal of it in this parish. In one family six daughters were deaf and dumb, one son a maniac, and another imbecile. In another family four daughters were deaf and dumb. There are many other cases of imbecility and imperfect development, either of bodily or mental power or both, all in this parish. Yet this parish is well drained, has admirable water all flowing from gritstone, and is spread over a wide and very open valley. Goitre chiefly prevails among the aboriginal inhabitants. I know but of one instance where any strangers coming to live here (and there are many) have shown any symptoms of it. Among the aborigines the system of intermarrying has been carried on for generations to an extent which I have never met with out of Derbyshire, and to this fact, more than to any other, I attribute the prevalence of this disease. Some years ago I obtained from all the medical officers of our union an opinion as to the possible and probable effect of administering to sickly children, at a certain age, in the spring of the year, port wine and quinine (especially if good milk were a constant part of their diet) in gradually eradicating the seeds of goitre. Their opinion was unanimous that the systematic adoption of such a course would *in time* be effectual. But then the poor could not be expected to buy such articles. The guardians should have the power and indeed be *required* to dispense them whenever their medical officers recommended them to be given. It would be a most economical policy to do so.*

* Mr. C. Evans (evidence 3), says, "Cases of 'Derbyshire neck' are diminishing, though still hanging about the district in "which it used to prevail."

"In connexion with this subject comes the labourers' cow and cottage allotments. I am sorry to see that modern notions of political economy are year by year causing these things to disappear amongst us. Twenty years ago there were few respectable labourers in this parish who had not their cow or cows. The wife and children mostly did the work required by them, and the husband gave his own labour to his employer. About 12 years since a large portion of the parish changed hands, and the first thing which the new owner did was to abolish the old system on his entire estate. I am sure that the change has been prejudicial in everyway." J. 2.

66. The "Derbyshire neck" is certainly much less prevalent in the county than it used to be, and from whatever cause the malady settled itself in that district, there can be little doubt that the number of persons attacked by it is diminishing pretty much in the same ratio as the power of obtaining more nutritious diet increases.

67. The introduction of Mr. Wrench's and Mr. Vawdrey's evidence leads me to discuss here the provision of milk, and what I may call cow-allotment system, because I am unwilling to weaken the effect of their evidence by allowing any other subject to intervene. Cow-allotment system in Derbyshire.

I believe it would be impossible to over-estimate the value of such a provision of milk as is within the reach of the families of most of the Derbyshire labourers. There are features too in the manner in which it is sometimes obtained, which tend to show how the condition of the labourer and his family may be improved without the danger of making him above doing his duty in that state of life to which it has pleased God to call him.

68. Many labourers in the North of Derbyshire rent with their cottage six or eight acres of grass land with a shippon attached, and are thus enabled to keep two cows during both summer and winter. Others rent a smaller quantity of grass land which they mow, and graze their cows during summer in one of their masters' fields, or more commonly in the nearest nobleman or gentleman's park. Others again, who live near a park where they can enjoy this privilege, and who have no cow of their own, borrow one from a farmer and so get her milk for the summer months at a cost of from 3*l.* to 4*l.*

69. Some further examples of the evidence I received on this subject will perhaps explain the milk system better, and show how, in the opinion of persons who know both, a labourer with his cow-allotment compares with a small farmer.

Mr. R. Nesfield, agent to the Duke of Rutland, says,—

"Most labourers have a garden and two small fields enough for two cows, one field to pasture and one to mow."

70. Lord G. H. Cavendish, M.P., chairman of Bakewell union, says,—

"There are in the neighbourhood, both on the properties of the Duke of Devonshire and Duke of Rutland, allotments of land, but I think in this district the better class of labourers look more to renting an acre or two of land to enable them to keep a cow."

71. Mr. Young, of Ewe Close, says,—

"At Hassop Park (Col. Leslie's) they take cows in for 21 weeks in summer, as at Chatsworth. If a labourer has not a cow he borrows one. They have cow clubs to which the members pay 2*s.* 6*d.* a year."

72. Mr. Cottingham, agent to the Duke of Devonshire, speaking of Edensor, says,—

"The cottages have all gardens, and most of them have sufficient land to winter a cow. In summer they pasture their cows in Chatsworth Park, paying 3*l.* for the summer's grass, about 21 weeks."

On the subject of cow allotments *versus* small farms, Mr. Cottingham says,—

"I think that a man with an allotment of, say, 10 acres, to keep a couple of cows, is better off than the holder of 20 or 30 acres or a farm just big enough to tempt him to do nothing else but work on his farm.

"I reduced one man to 10 acres from 20 to compel him to work, and he afterwards told me I had made a gentleman of him; he now works for the Duke of Devonshire at 14*s.* a week, and has his grass allotment of 10 acres. This system works well, bringing up a good class of labourers, and giving their wives an occupation at home."

73. The Rev. J. Hall, vicar of Edensor, says,—

"I am clearly of opinion that the small farmers, *i.e.*, persons holding from 30 to 60 acres of land, are as a class worse off in this neighbourhood than the labourers, who receive generally from 14*s.* to 18*s.* per week.

"On the other hand, where a labourer can have, as is common with us, just so much grass land as will enable him to keep one or two cows, which can be managed by his wife with scarcely any demand upon his own time, his position is undoubtedly much better than that of those to whom this privilege is denied.

"I am satisfied that these views are shared by nearly all who are acquainted with the district."

74. Mr. Samuel Turner, bailiff to the Duke of Devonshire, for the Bakewell district, says,—

"We have a good many occupiers of a cottage and a few acres who keep one or two cows. These men are labourers as well, and are well off, fully as well off as a man who farms 30 acres and is not a regular farmer. A man who occupies less than 100 acres has great difficulty to make a living, as land here is chiefly grazing land. Men who have no land can 'lay' a cow for 20 weeks in summer for 4*l.*"

75. Mr. M. F. Mills, who has the charge of large estates in the neighbourhood of Chesterfield, says,—

"A labourer is best placed where he has just sufficient land to keep a cow, and that we encourage. Where I can give a man two or three acres to make hay of to keep his cow in winter, and provide a general cow pasture for summer at 3*l.* 10*s.* for 20 weeks (May 17th to October 10th). This works remarkably well, especially among mechanics. I think 20 poles quite sufficient for a spade-cultivated garden or allotment."

76. Such are the opinions of gentlemen who have every reason for understanding the position of the labourer and small farmer in North Derbyshire. I have not myself the smallest doubt that a regular labourer with 14*s.* a week and a grass allotment sufficient to keep two cows, is in a better position pecuniarily than the small farmer; and all the evidence I have received on this subject in Derbyshire, and have since received in South Wales, goes to show that he treats his family fully as well, *i.e.*, that he sends his children more regularly to school, and does not send them to work so early. Cow-allotment system *versus* small farms.

The amount of savings too necessary to become the possessor of a couple of cows and occupier of

J. 2.

from 6 to 10 acres is within reach of 10 times as many labourers, perhaps 100 times as many, as the amount which would be required to stock a farm which would maintain him with equal comfort as a farmer.

Here then lies the secret of the comfort of many of the labourers homes in North Derbyshire. The father brings in 14*s.* or 15*s.* a week, and the mother finds work enough at home in managing her cows and house, and looking after her husband's and her children's clothes; and when their turn comes the children go out to work with frames much stronger than those of their own age who have lacked one of the first necessaries of early life, and with the advantage of an industrial training which is certain to be of use to them in after life.

An allotment or garden is of the very greatest possible benefit to a labourer as long as it does not interfere with his legitimate employment, but a cultivated allotment very soon reaches that limit. The work to be done on such an allotment is chiefly man's work, whereas the management of the cow allotment may be left almost entirely to the woman.

The great difficulty in the way of introducing such a system in the southern counties, at least for those labourers who live near gentlemen's parks, is the ignorance of the women of the management of cows and dairy produce, a difficulty which might, however, be gradually overcome.

77. In South Derbyshire there is no such reason for the gradually diminishing number of cows kept by labourers. Formerly many cows were kept in the lanes in summer, and fed in the winter on grains purchased from the Burton breweries. During the last few years the grazing of cows about the roads has very properly been put an end to, but no provision has been made for the cows of labourers who had long enjoyed that privilege.

78. I have dwelt on what I consider the advantages of the cow-allotment system as against small farms; because unless we are altogether to abandon our approaches to free trade in land as in other things, it is impossible to resist the tendency to increase farms to such a size as to make it profitable to use on them all the means which reduce the cost of labour and add to the value of the produce.

Schools and School Attendance.

79. There has been a considerable improvement in the provision of schools in Derbyshire during the last few years, and their number is still increasing.

In answer to the circular question the Board of Guardians for Burton union (Derbyshire evidence, 32) say,—

"There are parochial schools in nearly every parish, and the children's attendance is not interfered with by early labour."

Quality of schools varies in proportion to the resources of the clergyman and presence of resident gentry.

The quality of the schools, however, varies very much, being chiefly dependent on the manner in which they are supported by aid other than that derived from the children's pence, which aid varies in proportion to the resources of the clergymen and the presence of resident gentry. Some of the parishes are very large and the whole teaching power is frequently expended on those children who are fortunate enough to live near the parish church.*

80. I will give an example from the evidence to show that in Derbyshire as elsewhere the clergyman is apt to be left to bear the brunt of the educational fight. In answering the circular question for Darley parish, the Rev. D. Vawdrey says,—

"The greater part of the property in this parish is owned by non-resident proprietors, most of whom contribute nothing to the education of the poor. Ill paid as my teachers are, the deficiency in the funds of the school has (every year) varied from 10*l.* to 30*l.*, which has invariably fallen on myself." †

81. In a county where school attendance is affected by other occupations much more than by farm labour it would be difficult to obtain such returns as would show accurately how far agricultural employment is a hindrance to education. The only return of any importance which I received was from the endowed school at Hilton in South Derbyshire. This school, which is a very popular one in its neighbourhood, has on its register 36 boys of the agricultural labouring class in summer and 58 in winter. *Of boys under* 10 there is an average attendance of 18 in summer against 24 in winter. Osier peeling (which you will find described in Derbyshire evidence, 35) might altogether account for this winter increase in average attendance, but it cannot, as it only lasts six or seven weeks, account for the fact that there are only 22 boys of that age on the register in summer against 30 in winter; it would appear in fact that 8 out of 30 boys under 10 years of age omit to attend school at all in summer. *Of boys between* 10 *and* 13, the summer register of 14 doubles itself in winter, and the average attendance increases from 5 to 22. A large proportion of boys of that age therefore who are otherwise engaged in summer attend school in winter.

At Hilton school the winter attendance of boys between 10 and 13 is very nearly equal to that of boys under 10, but it would be unsafe to draw any conclusion from this fact, as I have no returns to show how far the popularity of the master of this school affects the attendance of boys of that age at neighbouring schools.

School returns confirm general evidence as to effect of farm labour on school attendance.

82. There is, however, nothing in the return of the Hilton school nor in that from Handley, near Staveley (Derbyshire evidence, 21a), to contradict the general tenor of the evidence, which shows that up to 12 or 13 years of age farm labour does not altogether withdraw children from school, but that as early as 10 it makes their attendance irregular.

83. Owing to the fact that children remain longer at school in Derbyshire than in more southern counties, there is not the same pressure to keep up a regular attendance at an early age.

84. Opinions as to the extent to which the indifference or negligence of parents interferes with the

* It must not be forgotten that a large number of children in Derbyshire are educated by a half-time system in schools of variable quality attached to factories and supported by the manufacturers.

† I wish very much I had been permitted to give you an account of the income of the schools in two townships of the large parish of Duffield (which I used to know well in times past) showing how much of the necessary supply is derived from landowners resident and non-resident.

progress of education differ in Derbyshire as elsewhere, but on the whole I am inclined to think that the advantages of education are better appreciated in that county than in the counties I have already reported on. J. 2.

Indifference and negligence of parents as affecting school attendance.

Mr. John Coleman, whose experience was gained in Bedfordshire, says (Derbyshire evidence, 29):—

"I must say the working classes are very much more alive to the benefits of education than in other districts, where the farmer and his men are quite different classes, and not as here, the one in many instances sprung from the other; and it is the hope and struggle to get into a small farm that induces many a labouring man to keep his children at school when they might be pecuniarily benefiting him by work.

"I think there are many more inducements in this district for young men to get away from agricultural work, and therefore they are more careful about education.

85. On the other hand Mr. J. Young, whose experience was gained in the south of Scotland, says (Derbyshire evidence, 15):—

"There are plenty of parish schools about here (Hassop), but there is not that earnestness among the parents and the parish ministers that you find in the north."

86. The Rev. J. H. Jenkins, who has spent the last 20 years in humanizing, christianizing, and educating one of the most benighted districts in Belper union, says:—

"The poor think little of education, and are unwilling to pay the small sum required of them; on the smallest pretence they keep their children at home."

87. Mr. John Shaw, who can speak with considerable authority on this subject, in his evidence for South Derbyshire, says:—

"The means of education are national or parochial schools, and in a few instances endowed schools or private schools of landed proprietors. Advantage is *not* taken of these means to the extent which could be wished, although there is a general desire for the children to be 'taught.' This is not attributable, except in a comparatively small degree, to early labour or inability to pay, but I believe it arises from carelessness and negligence on the part of the parents, and in many cases, where it can be afforded, from an indisposition to pay the weekly pence. I know, however, of many instances where great anxiety exists to educate the children and for which purposes great sacrifices are made."

88. I did not visit any parish in Hertfordshire where the children were not within easy reach of some school, and I think there are few children, at any rate in the south of the county, who have to complain of the distance they have to go to school.

Schools and school attendance in Hertfordshire.

89. The Hitchin Board of Guardians, who discussed all the questions in the Commissioners' circular of inquiry, answered the one which refers to the provision of schools as follows:—

"Most parishes have national schools, and some have also schools on the British system. Parishes which are entirely without are usually within reach of neighbouring schools."

This answer reads as if the provision of schools is not quite so good in the Hitchin union, but for that I cannot answer personally.

90. Table C. of the Herts evidence contains in detail school returns from seven rural parishes lying near each other in the neighbourhood of Hertford. These parishes, which extend over 13,347 acres, contain 2,753 inhabitants, and their school account stands thus:—

School returns from seven rural parishes in Herts.

There are of the children of the agricultural labouring class in average attendance—

In summer	137	boys under 10.
	32	„ between 10 and 13.
	152	girls under 10.
	80	„ between 10 and 13.
Total children under 13 -	401	
In winter	131	boys under 10.
	32	„ between 10 and 13.
	152	girls under 10.
	80	„ between 10 and 13.
Total children under 13 -	385	

The same schools have on their registers,—

In summer -	-	517 children under 13.
In winter -	-	489 „ „

If the attendance at these schools is drawn entirely from the parishes which they represent, the number of children in the registers as well as in average attendance is higher in proportion to the population than in any group of parishes from which I have as yet received returns.

The only way, however, to settle this question fairly is to take every school in a large area, and that I had not time to do in Herts.

Excluding Watton school, where there is a much larger attendance of girls than boys, the number of boys under 10 who attend school is about the same as the number of girls. That the attendance of such boys decreases in winter, no doubt owing to the state of roads and weather, appears to me to show that farm labour, which at their age would be confined to the summer half-year, interferes very little with their school attendance.

At 10 a great change takes place. The summer and winter attendance is the same, but the number of boys between 10 and 13 in attendance (again excluding Watton) has sunk to one-half of that of the girls of the same age. The working life of the Hertfordshire boy begins soon after 10, and once begun it puts an end to school attendance, as is shown by the fact that the winter attendance for boys over 10 shows no increase on the summer attendance.

91. In Hertfordshire, where good schools are provided, you may expect to find children of the agricultural labouring class kept pretty regularly at school from 5 to 10 years of age; at an average of 11 years of age their education, as obtained at day-schools, altogether ceases.

Summary of evidence derived from school returns.

J. 2.

92. In Derbyshire children are not usually sent to school so early, and up to 10 the attendance is more irregular; the education, however, is continued at day-schools during the winter half-year, in the majority of cases, up to 12 or 13 years of age.

93. It is pretty clear from the returns of schools I have quoted that where good schools (always excepting the plait country) are provided, the labouring class in Herts speedily learn to take advantage of them.

As to Restrictions on Agricultural Employment for the sake of Education.

Resolutions of Boards of Guardians in Derbyshire.

94. The Board of Guardians for Chesterfield union (in Derbyshire) say:—

"In the opinion of this Board, it is highly desirable that all children should be able to read and write before being employed in agriculture, and that if they are unable to do so they ought not to be so employed before 10 years of age."

95. The Guardians for Belper union (Derbyshire evidence, 24):—

"We do not consider it desirable to place any restriction on the age at which children should be permitted to work on the land, inasmuch as children in this union are very seldom so employed under 12 years of age."

96. The Burton Guardians (Derbyshire evidence, 32) say:—

"It is not desirable to place any restriction on the age at which children should be permitted to work on the land.

"The children's attendance is not interfered with by early labour."

Opinion of majority of witnesses.

97. The usual answer given by employers of agricultural labour in Derbyshire, as well as by the majority of other witnesses from that county, to the question of limiting the age at which children should be employed in farm labour, is that no such limitation is necessary, as it is not usual so to employ children until they are 12 or 13 years of age.

Restrictions, if any, best suited to Derbyshire.

98. The arrangement which would suit Derbyshire best would be a compulsory attendance for eight months in the year up to 10 years of age, and for four months in the year between 10 and 13. An attendance of eight months for children under 10 would not interfere with the family picnic in time of osier peeling, nor with the chance of obtaining healthy exercise while assisting their parents in haytime or harvest. Nor would a four months winter attendance up to 13 years of age appreciably affect the earnings of boys between 10 and 13.

Restrictions best suited to Herts.

It is a very different matter in a county like Herts, where boys expect to obtain a yearly engagement by the time they reach their eleventh year. What I have already said of the neighbouring counties would apply here. A limitation of employment to children over 10 years of age should be qualified by a permission to work at 9, for those children who can obtain a certificate that they can read and write; and any limitation of labour for children between 10 and 13 by compelling attendance at day-schools must contemplate the fact, that it will deprive the families of such children of from 2*s.* to 3*s.* a week during the time necessary to fulfil such attendance.

Resolutions of Boards of Guardians in Herts.

99. The following was the resolution of the Hertford Board of Guardians, when I consulted them on this subject:—

"It is the opinion of the Board that no boys should be employed in agricultural labour under 10 years, or at 9 if they have a certificate from the manager of the school that they have made sufficient advance in reading and writing to admit of their leaving school at that age."

100. The Hatfield Guardians passed a resolution to the following effect:—

"The Board are not of opinion that it is desirable to fix an age for the employment of agricultural labour."

101. The St. Albans and Hitchin Guardians also passed resolutions against limiting the age at which children should be employed in agriculture.

102. To give another example of the difference of the two counties I am reporting on, where witnesses in Derbyshire are in favour of a limitation of labour, they say children should be kept at school till they are 12 or 13; in Herts few would place the limit above 10 years of age.

Suggestions as to an edutional scheme by the Rev. D. Vawdrey.

103. The only suggestions for an educational scheme which I have received from these counties in a form to quote here, are those made by the Rev. D. Vawdrey, who says that there should be,—

1st. "A school rate to be paid by the *owners and not by the tenants.*

2nd. "That one-half the cost of the school, &c. should be paid by Government to give them the right of interference and inspection.

3rd. "That it should be made obligatory on millowners to send their children" (*i.e.*, the children whom they employ) "to a school which has a *certificated* master, should there be any such within reach.

4th. "That the hire of any child should be prohibited, *unless certified by the inspector as able at least to read and perhaps write moderately*, under a certain age, say 9; and that the certificate should hold only on condition of a certain amount of attendance *subsequently* either at night school or in the winter months until 12 or 13, unless the inspector should certify sooner that the child's education is sufficient."

Curiously enough these recommendations come from Derbyshire. Mr. Vawdrey's parish in Derbyshire is, however, peculiarly affected by the demand for youthful labour in large nursery gardens. The limitations of labour he recommends resemble very much those which I suggested as applicable to Oxfordshire and Berks, and which would apply equally to Herts.

That a school rate should (unless the whole system of rating is revised) be levied on the "*owner* "*and not on the tenant*," I perfectly agree.

As to the second recommendation, that half the expenses of the school should be paid by Government, I disagree, as I think that the State contribution should in no case exceed one-third of the expenses of the school, leaving the remaining two-thirds to be equally divided between the children's pence and school rate.

Mr. Vawdrey's third recommendation points to what appears to me to be the first step in the direction of educational improvement, viz., a better system of inspection.

If for instance the school inspectors had access to every school of whatever description in the

district under their charge, we should have very little difficulty in discovering where a rate was necessary either to provide a suitable building or support a properly qualified (not necessarily "certificated") teacher. J. 2.

104. Since I have had the honour of serving on this Commission I have never lost an opportunity of impressing upon farmers the benefit of education to agricultural labourers as labourers, but before leaving the subject of education, I would like, while there is yet time, to enter my protest against encouraging "book learning" to the exclusion of all industrial training. Influence of education on the quality of labour and character of the labourer.

I do not for a moment wish to undervalue the benefit of education to the agricultural or any other labourer. It is, no doubt, one of the reasons why the northern labourer is superior to the southern, and, *coupled with a more earnest religious training*, it is, perhaps, *the* reason why the border labourer is superior to the Derbyshire, but it is not the reason why the Derbyshire labourer is superior to the Herts.

The same determination which led the northern labourer to overcome all the difficulties which lay in the way of his educating himself is at work now in enabling him to make the most of that education, and it must not be forgotten, in trying to measure how much of his superiority is due to education, that the fact of his being now educated is the effect of a superiority existing before he was educated.

To me, the most apparent advantage to the labourer as well as to the country of a more extended education, seems to be, that it will put it in the power of an able and industrious man, wherever in England he may chance to be born, to see that he may go and share with the Derbyshire, or any other highly paid labourer, the advantages which are now shut out from him by a cloud of ignorance; but the power of reading, writing, and ciphering alone, will not make him an able or industrious labourer.

Cottages.

105. The state of cottages in Derbyshire varies, as I believe in all other counties, from very good to very bad; on the whole, I think, the proportion of good cottages is larger than in any of the counties I have previously inspected. Provision and quality of cottages in Derbyshire.

There is evidently a general desire on the part of landowners to provide decent dwellings for the labourers on their estates, and this work is progressing pretty much in proportion to the means at the disposal of the owner.

A good many of the best cottages I saw have been recently built for the accommodation of large farms, and are let with the farms; but the most prevailing practice is for the cottager to hold directly from the landowner.

106. One or two examples from the evidence will probably help me to explain the state of matters.

Mr. R. Nesfield, agent to the Duke of Rutland, speaking of the Bakewell district, says (Derbyshire evidence, 6):—

"Cottages are generally good in this neighbourhood, and are sufficient for the supply of labour, and are for the most part conveniently situtaed with respect to the farms."

107. Mr. W. Greaves, a large occupier in Bakewell parish, says (Derbyshire evidence, 11):—

"The great drawback to the farmers generally is the want of cottages on their farms, and the rule is that the labourers live in the towns and villages, and I should think average two miles from their work; this tells on the men heavily, both in distance and the baneful effects of beer-houses."

As a matter of fact a good many labourers living in the town of Bakewell, in houses which cannot be described as good, have to go much further to their work than is good for them.

108. The Rev. D. Vawdrey, answering for a large parish (Darley), says:—

"The cottages are substantial and not overcrowded."

Edensor parish, as everybody who has visited Chatsworth knows, finds excellent accommodation for its 600 inhabitants from the noble duke who owns it to his poorest labourer.

109. Mr. M. F. Mills, land agent, speaking of the neighbourhood of Chesterfield, says:—

"Agricultural labourers cottages are above the average. They belong to the landowners, and are held directly from the landowners, except on large farms where one or two cottages are let with the farms."

110. Mr. T. W. Evans, landowner, speaking of Allestree parish, says:—

"The cottages in this parish are many of them new and generally good; a few, however, are very bad."

The good cottages in Allestree belong to Mr. Evans himself, the bad ones to small freeholders.

111. The Rev. J. H. Jenkins, of Hazelwood, says:—

"Our cottages are very bad; there is rarely more than one bedroom in them, in which adults and children crowd together. This is partly owing to the circumstance that they belong to small proprietors who are desirous to get as much as possible at the least outlay."

What struck me most about Hazelwood and the adjoining township of Shottle was the wretched state of several of the small farmhouses. If any man is desirous of receiving a practical answer to the question of large or small holdings, as affecting agriculture, I would advise him to visit these townships.

112. Mr. John Coleman, land steward to Lord Scarsdale, speaking of the neighbourhood of Kedleston, says (Derbyshire evidence, 29):—

"In this parish the cottages are nearly all new and good, but in the district I must say they are bad and small, with very poor accommodation for the division of the sexes, and are ill ventilated. They are situated in villages, and the inhabitants have a long distance to go to their work. I cannot say anything in their favour, and as they are short in number in many districts, they are very much overcrowded."

113. Mr. John Shaw's account of the cottages in South Derbyshire may stand for the county. He says:—

"Some of the cottages in South Derbyshire are very poor indeed, and in some places they are not sufficient for the supply of labour in the respective localities, nor are they conveniently situated. Some are also overcrowded, and evil results to morality have come under my notice in consequence. Within the last 20 years,

J. 2. however, very great improvements have been made in the cottages in this county, and on many large properties with which I am acquainted a very excellent state of things exist, cottages with all necessary conveniences having been erected, and good gardens having been provided."

114. I don't recollect visiting any cottage in Derbyshire in which there was not a fireplace with a boiler on one side and an oven on the other, a provision which one seldom sees in southern cottages. Fuel is no doubt cheaper in Derbyshire than in the south of England, but there are many occasions on which a labourer's wife if she had such a kitchen range would make shift, even where fuel is dear, to keep a hot dinner or supper ready for her husband.

There was, too, an air of cleanliness and comfort about the interior of the Derbyshire cottages which gave me a very favourable impression of their mistresses.

Condition of labourers' cottages in Herts;

115. To report on the condition of labourers cottages in Herts would be to repeat, with a change of names, what I have said of their condition in Bedfordshire, Buckinghamshire, Oxfordshire, and Berks.

What I said, for instance, of the Duke of Bedford's estate in Bedfordshire, I might repeat for Mr. Abel Smith's in Herts; no expense has been spared in providing for the comfort of everybody connected with it. With the exception, however, of Mr. Abel Smith's, I know no large estate in the part of the county to which my inquiries were confined where the cottages are, either in quality or quantity, what the owner would like to see them.

116. Cottages, it must be remembered, are a very much more serious item in estate economy in Herts than in Derbyshire. Less than one-half of the cottages required to supply labour in the former county would be sufficient (taking the average of the counties) for the same acreage in the latter. When the great landowner in Derbyshire has supplied one cottage for every 60 or 70 acres of his best land, he has done well; but his brother in Herts has not done well till he has supplied twice as many.

Measured in this way, I am afraid a very small proportion of the Hertfordshire landowners have done well; too many of the labourers working on their estates live in cottages which do not belong to them, and of which, if they did, they would be heartily ashamed.

I do not remember visiting any town or large village in Herts, with the exception of Watton, where I did not see some very bad cottages inhabited by farm labourers. As bad as any a man need to occupy may be found in Hatfield, St. Alban's, Harpenden, Hitchin, and Stevenage.

Allotments.

in Derbyshire;

117. I have already described the cow-allotment system of Derbyshire. All cottages belonging to the landowners in Derbyshire have either gardens attached to them or small allotments of garden ground. Allotments of land are provided near many of the towns and mining villages, and are greatly prized by the miners and mechanics. The Duke of Rutland, for instance, provides allotments of 40 poles each in the neighbourhood of Ilkeston, which are in great demand amongst the colliers and framework-knitters.

Allotments of land for garden cultivation are even of more importance to colliers and men engaged in indoor work than to farm labourers; and the example of his Grace of Rutland is one which might perhaps be followed more extensively.

in Herts.

All the cottages on Earl Cowper's and Mr. Abel Smith's estates near Hertford are provided with good gardens or allotments, and such a provision is becoming very general in the county. Mr. Trethewy, Earl Cowper's agent, whom you will accept as a high authority on the subject of allotments, and from whom I received great assistance while I was in Herts, told me that he did not find allotments so much appreciated or so well done by in that county as in Bedfordshire.

118. On the subject of benefit societies, beer-houses, and pauperism, I have nothing to add to what I have already said in my last report.

After expressing my thanks to the many persons who gave me kindly help in Derbyshire and Herts,

I beg to remain,
Gentlemen,
Your obedient servant,
GEO. CULLEY.

August 28th, 1869.

REPORT by Mr. R. F. BOYLE on SOMERSETSHIRE.

TO HER MAJESTY'S COMMISSIONERS.

GENTLEMEN, July 1869.

1. I VENTURE to lay before you the evidence which I collected on the employment of women and children in agriculture in the county of Somerset during the months of June and July last year, and the February and March of the present year; and in the course of my inquiries I came to the conclusion that while demanding in a conspicuous degree inquiry into the general condition of the agricultural labouring class, the wages they receive, and the habitations in which they dwell, the county of Somerset does not so much require a special inquiry into the employment of women and children in agriculture, the principal object of my mission, except in one or two districts. There are two main causes to account for this. (1.) Somerset is more peculiarly a pastoral county than any other county in England, possessing, though only eighth in size of English counties, a greater extent of surface under grass than any other county except Yorkshire, and breeding stock more extensively than any other except Yorkshire and Lancashire; and in a pastoral country there is less work for children than in an arable country, while much of the milking is done by men and by farm servants. (2.) All the women in the most southerly part of the county, where wages are low, are engaged in sewing gloves in their own cottages, to be sent to Yeovil, Milborne Port, and other centres of the glove trade.

Somersetshire a pastoral county.

2. There are only two districts in the county which seem to demand a very special inquiry on these subjects, that is districts in which the extent of arable land exceeds that of the meadow and pasture, and therefore employs many women and children, viz., the valleys and slopes of Exmoor and its offshoots, and the cold soil on the hills around Somerton. All over the rest of the county meadow and pasture prevails, though the districts are few in which there is not also a small proportion of arable land intermixed, and in which women and children will not be found more or less employed.

Only two important arable districts.

3. To these two districts we must look, therefore, for the principal employment of women and children; to the former principally, comprising the sandstone formations due west of the Quantock hills and Taunton to the borders of Devon, through the whole extent of which there is no employment for women, except agriculture; whereas the latter district comprises the lias formation between the valleys of the Yeo and Brue, and to the eastward of Sedgmoor, into which the gloving district extends, and where gloving will be found sharing the labour of women with agriculture.

4. In West Somerset the wages are far lower than in East Somerset, consequently there is a greater necessity for the labour of boys and women, and we shall find it far more prevalent. About Bristol, where wages are often 12*s.*, women will hardly work out at all. In West Somerset, where the prevalent wages amount to about 8*s.*, nearly every labourer's wife works. In the south, where gloving prevails, wages are also very low; a circumstance attributed to the money made in gloving by the labourers' wives and daughters being ample to supplement any deficiency.

Low wages necessitate the employment of women and boys.

5. With respect to the employment of boys, a general rule may be laid down for almost all the county; for all the county west of the Mendip hills certainly. The differences are only differences in degree, according to the circumstances of the farmers and labourers in each individual place. In some places we find children taken earlier from school than in others; in some places receiving better wages than in others; but in all they are taken away from school earlier than the school authorities think advisable, and in all for the same employments.

Employment of boys.

K.

6. The first employment to which they are put is "keeping birds," an employment which occupies them only for certain months in the year; they are taken away from school for a month or six weeks at a time, just after the corn is sown, and just when it is ripening. This is an employment shared also by little girls. Mr. Corner, of Sampford Brett, told me that he would just as soon have a little girl to do the work; and Mr. Hancock, of Halse, said that you generally have to get a little girl to keep birds, as boys get regular employment so soon. The ages at which they are taken vary, but in many places boys go as young as 6 and 7; 5 years of age is the youngest I have found; these, however, are exceptional cases; 8 and 9 would be the more common time. At the time just before the corn ripens they are often expected to be out at 5 a.m., and remain out till sunset. At the sowing time of course their hours are shorter, as the days are shorter, and they are only expected to remain out as long as daylight lasts. Sunday is no exception, so that they get no holiday at all during the week. They have to be out in wet or fine weather alike, sheltering themselves under a tree or hedge when it rains, and sometimes getting hold of a hurdle, and thatching themselves a little hut in the corner of a field. They frighten the birds, as a rule, by shouting, sometimes by beating sticks together; and as the time gets on the birds are more difficult to frighten, for they get accustomed to the voice, and the child has to follow them about, hunting them from one place to another, so that it sometimes becomes very tiring work.

Necessity of bird-keeping.

7. Nearly all the farmers are of opinion that it would be very difficult to get on without children to "keep birds," and of course it is their object to get children out as young as possible, smaller remuneration being required for a smaller child. There are opinions, however, at variance with this. Some farmers complain of boys being so idle, they are really of little use; one expressing it so strongly as to say, that each boy requires a man to look after him. Some prefer to employ an old man with a gun, often without shot, merely to frighten the birds, or with shot to kill a rook, the bird most dreaded, and scatter a wing here and a leg there, a precaution that will often drive the rest away for some time. Those who are in favour of children "keeping birds" say that it is not so much the one child that does the good, but that his little brothers and sisters bring out his dinner, or come to see him, and the noise made by several children scares the birds. Yet again it is objected to this that a number of children running about destroys hedges and other property.

Bird-keeping by twine.

8. Some farmers have tried to substitute bird-keeping by twine, but this can only be done when a farmer has not a large extent in corn; besides which birds very soon become accustomed to seeing the feathers shake about on the twine. Mr. Featherstone, at Wiveliscombe, remarked that a peck more wheat sown does more good than all the boys.

Regular employment of boys.

9. The first regular employment obtained by boys is "driving plough," in other words, becoming carters' boys; for the term "driving plough" includes generally being with the horses. The ages at which they begin this work vary according to the means of the parents; in general, after "keeping birds" for a year or two a boy will be given regular work by the farmer who employed him irregularly before. In many instances he is then taken to live in the farmhouse, and then, even when not "driving plough," other work, such as minding the sheep or pigs, is found for him, or he makes himself generally useful in the yard. The greatest necessity for shepherds' boys is found on the moors, which are cut up by unprotected ditches, and it is the boy's duty to prevent the sheep from falling into the water. In certain parts of Somerset it is also usual to have in the farmhouse what is called a "scrub boy," who does all the dirty work about the yard, but has no special duty; such a boy is sometimes a poor relation, and therefore more in his employer's power.

"Driving plough."

10. To expect a boy of 7 or 8 years' old to mind a horse seems at first absurd; but I was often told that unless a boy begins very young to be with horses he becomes timid and of little use, and never learns to make them obey his voice. Accidents occur; in fact they must sometimes, but, as a rule, the horses are very tame, and the boys gain power over them by being unconscious of their own danger. Still some boys complained of having been knocked down or having had their feet trodden on by horses; and I had many complaints of the danger attending the system. In some districts the actual necessity for a boy to lead the horses with the plough is going out, for the use of reins is becoming very general in the light soils, but where the soil is heavy, and it is neeessary to plough with more than two horses, it is impossible for the ploughman to plough and drive at the same time, and a boy becomes indispensable. Here again it is natural for the employer to wish to have the work done as cheaply as possible, and the smaller the boy the lower his wages; whilst the boy's father, receiving very low wages himself, is only too glad to send his boy out as young as possible, and make him support himself.

11. It is not an unusual thing to meet a large cart drawn by one or more horses, and entirely under the control of a boy not 10 years of age. A little girl, 8 years of age, at Somerton, told me that her father trusted a little brother of hers, "not as big as me," with the cart and horses. Her father is a small farmer, and I found that the youngest children employed were generally the children of small farmers, not much removed above the condition of labourers themselves, who find the labour of their own children cheaper than hired labour; of course, such labour though often harder than hired labour would be far more difficult to restrict.

Employment of little boys and girls mixed.

12. So far, with the exception of bird-keeping, I have spoken of labour done by boys only; but there is a good deal of work in which little girls are found equally efficient. We shall, however, never find them employed to so great an extent as boys, and scarcely ever in regular employment, going out usually for a job, and usually with their mothers, and generally beginning at a rather later age than the boys. The school authorities did not complain so much of little girls being taken away to work in the fields, as of their being kept at home to nurse children, while their mother was out at work. The work done chiefly by girls, and by little boys as well, consists in stone-picking from the land, potato-setting and picking, and apple-picking. Mr. Hancock, a great employer of labour in Taunton Vale, told me that at a certain time of year, when he wants children to work among the turnips, he sends out a man into the village to collect all the boys and girls he can induce to come to work. It is the nearest approach to any gang system I have found. To a question as to the existence of gangs I always met with a flat denial: but in this instance some 20 children work in a row under the superintendence of a farm-hand; in fact, there are all the accompaniments of a gang system.

K.

13. A great deal of out-door work is done by children in the neighbourhood of Axbridge and the parish of Merriott. These two places are famous for their market gardens. Near Axbridge and Cheddar there are little plots of land on the slope of the Mendip hills, which, besides being very fertile, face due south, open to the full glare of the sun. Quantities of peas and early potatoes are grown for the London market, and at certain times of the year nearly every child in the neighbourhood, as well as every woman, turns out, and works long days in the gardens, setting and picking potatoes and picking peas. A great deal of hard work too falls upon them, as the husbands do the carrying, and all other work falls upon their wives and families. The case is very similar at Merriott, a large and fertile parish near Yeovil. Similar cases, too, are the whortleberry harvest in the neighbourhood of Porlock and the withy-peeling on the moors, both of which give employment to all the women and children of the neighbourhood for a few weeks. The Exmoor hills are covered with whortleberry plants in great abundance, and when they are ripe the women and children turn out to gather them, spending all the day on the mountains. A child can earn often as much as 1*s.* a day at this employment. Withy-peeling on Sedgmoor lasts for several weeks in the spring; it is generally done by a woman and child, the woman splitting the peel with an instrument called a break provided for the purpose, and the child pulling it off. Children as young as 5 are well up to such work, and it is no hardship, except in so far as it keeps the children from school, to which we shall have to refer presently.

Market gardens.

The whort harvest on Exmoor.

Withy-peeling on Sedgmoor.

14. The ordinary career of a girl in the purely agricultural districts is to be kept at home till about 12 or 14 years of age. During that time, in a well-ordered parish, and if one of an orderly family, she will probably go to school, with intervals of being kept away now and then for perhaps a little work in the fields in busy times, or to nurse the babies when her mother is at work. Some few, who get independent habits, prefer to remain on working in the fields, but it is the exception, and instances are becoming more rare; they usually take to millinery, or go out to service in a farmhouse. If milliners, they will stay at home, or, in some cases, join other girls and take a room, as more independent, but this occurs more often among the agricultural population resident in small towns than in the purely agricultural villages. All witnesses join in reprobating the system; they agree in saying that the custom of girls withdrawing themselves from the parents' supervision leads to immorality, and that they never make such good thrifty wives as the farm-servants. Of those who go to service a good many go away to the towns, such as Bristol or Weston, and such girls probably marry in the towns, and never return home, except on a visit; but the greater part still go to service in farmhouses. They begin service at 12 or 14 years of age, as soon as they are old enough to look after a child; for their keep first, and then with wages gradually increasing. As they become older they are given dairy work; they milk the cows, making the cream, &c., and probably end by marrying one of the farm labourers. Those who continue as young women to work in the fields are very few; and there is generally something against them, either they are deformed or deaf and dumb, or they are girls whom service has not suited; some have had what is usually called "a misfortune" in the country districts; but that does not prevent them in most cases from obtaining another place in service if they wish it.

Career of a girl in agricultural districts.

15. With married women the case is very different. They do not work out so much now as formerly, but in the west of the county labourers' wives still go out usually at busy times for their 8*d.* a day. It is not that there is a want of male labour; from time immemorial there has been certain field work that is looked upon as women's work, and they are often to be seen working when men are out of work. But there are few women who work as a regular thing all the year round; most of them only come out for haymaking, harvest, and to work among the turnips and mangolds, which last seems to be always considered the principal women's work. Few work out, except widows' and labourers' wives. In West Somerset an employer often expects his labourer's wife to come out in busy times if she is abled-bodied. In some cases the employer will stipulate that she is to come out to work at such times. I was told of a case at Combe Florey where the family have to turn out if the wife does not work out. Such instances point to the probability that it is really more to please the employers that the woman goes out, than for any profit that accrues to herself. Her wages are only 8*d.* a day for out-door work, and against that she has to set the wear and tear of clothes, the need of more food to support her, the payment to persons employed to make clothes, which she would make herself if at home, and the damage done to house and furniture by children left at home to take care of themselves. Many will allow that it is no real use to them. On the other hand, the evidence is very much at variance as to whether out-door work exercises a baneful influence on the character. With unmarried women there can be little doubt that working with men and boys, hearing bad language, and seeing sights among the beasts that they had better not see, cannot be for their good; but their work lies chiefly in the dairy farms, where they are out and about milking with the boys, and seeing a great deal of them in the farmhouse; whereas the work of married women, usually in the fields, is either only shared by other women or by their husbands. It may give them a certain roughness, but I saw many women who worked habitually in the fields, and were quite as respectable, if not more so, than those who stay at home; so on that point no very general rule can be laid down. As to the state in which their cottages are kept, of course they cannot be so tidy as those of the women who are always at home; but it becomes a question as to whether the disadvantage of their absence from home is counterbalanced by the advantage of more money coming in. Perhaps the worst part of the female labour is the influence it brings to bear upon the character of the husbands and children; little girls, sometimes boys, have to be kept at home to look after the younger children, and so lose their schooling; and the husbands come home and find the home uncomfortable, no supper ready, the fire probably out, and what more natural than that they should prefer instead of staying at home to go to the public-house?

Out-door work of married women.

16. The slight rise in wages of late years, and the dawning conviction that they do not really much increase the family comfort by going out to work, is now keeping the women more and more at home; in some parishes it is only the more old-fashioned, who have been accustomed to work, that keep it on now. The farmers, naturally, do not approve of the change; it is an extensive source of cheap labour that is

Women do not work out so much as formerly.

K.

gradually being drawn away from them. But, with the spread of education and general improvement the labouring class are beginning to see that the woman's place is by her own fire-side.

Ought female labour to be restricted?

17. With regard to the necessity of putting restriction on female labour, the majority of witnesses wish to put a stop to the working of girls, at any rate up to a certain age; but as to the labour of married women opinions are much divided. The majority, however, think no restriction advisable for one of two reasons, either that in the present low state of wages it would be hard to take away any means of increasing the family earnings; or that the supposed evil is righting itself, that female labour is gradually disappearing. If a woman can add 3*s.* or 4*s.* to the purse, when her husband only earns 8*s.*, it sounds very hard to prevent her doing so, even though you think you can prove to her that she is not really augmenting the wages as much as she supposes.

Reasons for the necessity of female labour.

18. The lowness of wages is the most usual reason assigned for the necessity of female and juvenile labour; when told that you cannot expect a man with a large family living on 8*s.* or 9*s.* a week to support his wife and children at home in idleness, it is difficult to find an answer to the objection; to say "raise the wages" is easy, but it is very difficult for the farmer to do so; there is pressure brought to bear upon him from above and below. Every one, except perhaps the farmer himself, wishes to see the wages raised; nay, he would be willing enough to raise the wages if he could do so without impoverishing himself, but with the present great demand for land the rents paid by the farmers are gradually rising, and it is impossible for them to pay higher rents and higher wages at the same time. At more than one meeting of guardians that I attended it was stated that the wages could never be raised till rents were lowered, and that as long as rents continue to rise the least that can be expected is that wages shall not fall. On one occasion a magistrate having suggested that the only means to check female labour is to raise the wages, a farmer retorted that the only means to raise the wages is to lower the rent. It is equally difficult to expect the landlord to lower his rent in the face of a rapidly increasing demand for land, and to expect the occupier to raise wages in face of an increasing demand for rent. The Rev. Mr. Hickley, of Walton, with whom I had some conversation on the subject, said that as long as there is no combination among the labourers it is very unlikely that wages will rise much; in towns where artisans are constantly thrown together combination is the natural result, but labourers scattered all over a large agricultural county, even if it occur to them to combine, find in the fact of their being scattered an almost insuperable difficulty. It is probable that the constant migration that is going on will ultimately lead to a rise of wages. The introduction of machinery is perhaps the cause that has hitherto prevented any such effect, and the fact that it is usually the strongest and best hands that go to seek higher pay elsewhere, and that the hands who stay behind are not worth so much money to their employers as those who have gone.

Wages in east and west Somerset compared.

19. Throughout the county of Somerset there is a most striking variety in the amount of money wages paid. Near Bristol and Bath an ordinary labourer will receive 12*s.* in money; in the far west, among the hills, usually 8*s.*; in some cases as low as 7*s.*; in one case I found it as low as 6*s.* But this money payment is not to be taken as a criterion of the full sum that passes from the pocket of the farmer into that of the labourer; where the wages are so very low there is almost always an allowance of cider given, sometimes a cottage, and there are various other perquisites, the extent and value of which vary according to the liberality of the farmer, and according to whether he is on a good footing with his men. Thus the system of low wages made up by perquisites to the value of a few shillings more puts a labourer far more in his employer's power than if he receives 11*s.* or 12*s.* a week in hard money; but it cannot be denied that the labourers prefer the old system as a rule; they know they cannot hire a cottage so cheap elsewhere, and they know that they cannot buy so much cider elsewhere for the money as they have allowed them by their employer instead of money. There is much to be said in favour of the cider truck and much against it; in its favour there is no doubt that it keeps the husband from the public-house; having been provided with enough to drink by his employer he usually goes home straight, whereas if he leaves off work thirsty he will probably go straight off to the public-house and spend far more money there than he can afford, returning home late more or less drunk. On the other hand, the cider being valued by the farmer at 1*s.* or 1*s.* 6*d.*, such a sum is a good deal to be allowed, say, out of 8*s.* or 9*s.* wages for one member of the family to spend in drinking; again, in many cases, the cider given is very bad and unwholesome, and assists materially to undermine the constitution. To obtain as much cider as possible is a great object to the labourer, besides for the mere purpose of drinking it; for condemned, as he is, from his poverty to eat so much dry bread, he uses it as a relish in which to dip the bread. There is little variety and little that is inviting in the food of the Somersetshire labourer. A little girl in the vale of Taunton Deane, being asked what she had for breakfast said, "bread and butter." What for dinner? "bread and butter." What for supper? "bread and butter and cheese." It is a fair sample of what the agricultural labourer lives on, except that where no cheese or butter is produced he has nothing but the bread dipped perhaps in cider: the wife drinks tea, and there is sometimes a bit of bacon for the husband after his work, unless they are so poor that they have to sell every atom of the pig to pay the rent. There is besides a concoction, called teakettle broth, given to the children: hot water flavoured with a few herbs or tag ends of bacon, sometimes little but the pure hot water.

The cider truck.

Food of a Somersetshire labourer.

Comparison of wages at Mr. Corner's two farms, Sampford Brett and near Bath.

Wages given by Mr. Risdon of Timberscombe.

20. Mr. Corner, of Sampford Brett, who has also a farm near Bath, gives at his Sampford Brett farm 10*s.* a week, and at his Bath farm 12*s.*; no cider at either. At the former, in way of perquisites, he gives "anything wanted in the way of turnips or straw," at the latter nothing; yet he reckons his Sampford Brett men the best off, and one of them who went up to the Bath farm with the idea of bettering himself chose to come back again. If wages are lower, provisions are cheaper in West Somerset. Mr. Corner's is a case of a farmer who gives few perquisites on either farm. The following case, that of Mr. Risdon, of Timberscombe, is that of an employer whose people are very well off, and yet are paid about half their wages in kind. In actual money he only gives an ordinary farm-labourer 1*s.* a day=6*s.* a week (it must be remembered this is only to an ordinary farm labourer, and to him whilst not working by task work; shepherds and carters always get a little more money in regular wages because they do less task work); but besides this he gives a cottage and garden and a quarter of an acre of potato-ground, his men working for him from 7 a.m. to 5 p.m., which gives them spare time to

work in their own gardens; also a quart of cider daily; grist corn at 6*s.* a bushel all the year round, and the run of a pig generally in an orchard; besides this he gives a good deal of task-work, which he prefers and which the men prefer. Mr. Risdon's father offered his men 1*s.* 8*d.* a day=10*s.* a week, to give up all perquisites, but they preferred to adhere to the old system. If his men now want more than he gives, he offers the 1*s.* 8*d.* a day like his father, but they prefer the old system, and he does not find that they leave him. K.

A special instance of the value attached to perquisites in West Somerset will be found in a letter from Mr. A. S. Lovelace, of Leigh farm, Winsford (Appendix 46). Mr. Anderson, the rector of Winsford, told me that Mr. Lovelace had offered one of his men 12*s.*, in lieu of 9*s.* a week and perquisites, and the man had refused it. Having been unlucky enough to miss Mr. Lovelace, I wrote him a letter, and he wrote back to me describing how by perquisites the 9*s.* weekly was made up to 12*s.* 1*d.* Mr. Lovelace, of Leigh farm, Winsford.

	s.	*d.*
Cash per week	9	0
Cottage and about 15 perches of good garden, rent free	1	0
Thirty perches of potato ground (30*s.*) nearly	0	7
One quart of cider a day from Lady-day to Michaelmas	0	6
Keep of a pig	0	3
Wheat, ¾ths of a bushel a week, at 6*s.* a bushel (market value 7*s.*)	0	9
Total	12	1

besides a few other minor advantages; this man is a carter. The other labourers receive 1*s.* less in money, but the same perquisites, and are at piece-work half their time.

21. Of course the value of privileges varies with different employers; for instance, though nearly every farmer will say he allows the run of a pig, it is not everyone who, like Mr. Risdon, will allow the run in an orchard or meadow; it is usually in a piece of waste land, sometimes by the side of the road to which the employer has no more right than the employed. At Cutcombe the people joined to buy a bit of land on which to run their pigs. With regard to potato-ground again, this can hardly be considered an advantage, except in some few cases, where, as in the case of Mr. Lovelace, it is actually given. Potato-ground is usually rented of the farmer at a very high rent, so that he makes a considerable profit on the rent he himself pays to the landlord; in return for this he usually does the haulage and manuring, but giving too much potato-ground is a subject on which he is naturally jealous from the fear of it taking the labourer away from his work and the facility it affords him of taking a few turnips or mangolds from his employer, and pretending that they grew on his own piece of ground. Grist corn is perhaps the most doubtful privilege of all. Some farmers, and these are the best instances, will give it at 6*s.* when the market price is above 6*s.*, and at the market price when it is below 6*s.*, but usually they will keep the man to 6*s.* even when the market price is below that sum, saying that he need not have it unless he likes. Sometimes when the market price is above 6*s.* he will make some such excuse as that he has no corn left; thus with most perquisites the value depends on the temper of the employer.

Value of privileges; run of a pig. Potato ground. Grist corn.

22. Mr. Knollys, agent to Lord Ashburton, was good enough to provide me with some estimates made by farmers on Lord Ashburton's property about Fitzhead of the wages given to their labourers (Appendix 62). The usual money payment in that neighbourhood to an ordinary day-labourer is 8*s.* or 9*s.*, and the five gentlemen with whose estimates he has provided me calculate that perquisites and task-work (Mr. Lovelace, above, did not calculate task-work) make the weekly wages up to sums varying from 11*s.* 6*d.* to 13*s.* 1*d.* Thus Mr. Fishleigh (Dean, Fitzhead,) takes the extra money earned in harvest, haytime, turnip-hoeing, mangold-pulling, and lumping it together at 88*s.* spreads it over the 52 weeks at 1*s.* 9*d.* a week. Mr. Knollys remarks that in some cases the extras are counted more closely than in others, for instance, two of the gentlemen calculate that they give the labourer 6*d.* extra by giving him a cottage at 1*s.* for which elsewhere he would have to pay 1*s.* 6*d.*, "but you will "readily see what the average will come out at." "I find," he adds, "a growing feeling among our "best tenants to give money instead of cider."

Wages given, as estimated by five farmers on Lord Ashburton's estate.

23. The enclosure containing a statement of money payments for one year to his labourers by Mr. J. Lutley (Appendix 62), also forwarded to me by Mr. Knollys, is of great interest. Mr. Lutley pays by the day, and the actual money payment, excluding task-work, is about 8*s.* weekly; to this he adds the task-work, and strikes an average of about 9*s.* per week in cash all the year round, before he proceeds to add the perquisites.

24. The most important task-work given, that is, that at which most money is earned, is of course the harvest, next to that the turnip-hoeing, and a few shillings also at haymaking and mangold-pulling. Hedging and draining is also piece-work, and at grubbing up a hedge the labourer is allowed to take what he requires for firing. When at harvesting a man, woman, and boy, to cut, to pick up, and to sheave, can clear about two acres in a long day, and sometimes make from 8*s.* to 10*s.*, besides cider unlimited. Harvest is the time when the labourer has it all his own way. Farmers as well as labourers prefer to give piece-work; they get the work better and more honestly done, and the men do not require to be looked after and kept up to their work. Besides it enables a distinction to be drawn between the man who is worth his money and the man who is not. Farmers complain very much that the custom of the country requires them to give as much to a married man who has passed his prime as to a thoroughly able-bodied labourer. Mr. Follett, of Bishop's Lydeard, with whom I had a talk while his corn was being thrashed, pointed out one of his men and said, "That man is worth 12*s.* a day to me, and I "have to give him the same as another who is not worth 5*s.*" Task-work or piece-work.

25. The following is a table of the wages given by various farmers in West Somerset, all taken down from the farmer's own lips. It includes simply the actual money payment given to an ordinary day-labourer, *exclusive of extra money earned by task-work.* Estimate of wages in money given by various farmers in West Somerset.

K. TABLE of MONEY WAGES paid by 25 Farmers in West Somerset, exclusive of Task-work or Piecework.

Name of Union.	Farmer.	In Money per Week.	Cottage.	Cider.	Perquisites.
Wellington	Mr. J. Lutley, Parsonage farm, Wiveliscombe.	8*s.*	Cottage	3 pints	Run of a pig, potato-ground manured and ploughed, firing from hedges, and drawing.
,,	,, John Davis, Blackgroves -	8*s.*	,,	2 quarts	Grist corn at 6*s.* if they choose, firing for cutting, and drawn for them.
,,	,, Corner, Wellington - -	9*s.*	—	1*s.* 6*d.* worth a week.	——
,,	,, Langdon, Chilworthy, Raddington.	9*s.*	—	Cider	Grist corn at reduced rate, 30 square yards potato ground, run of a pig, and keep of poultry.
Dulverton	,, A. Lovelace, Leigh, Winsford -	8*s.*	Cottage and garden.	1 quart daily	30 perches potato-ground, keep of a pig, wheat at 6*s.* per bushel, fuel hauled for them.
,,	,, Hardinge, Highercombe, Dulverton.	Summer, 7*s.*; winter, 8*s.*	Cottage	1 quart daily extra in summer.	30 yards potato-ground, keep of a pig, wheat at 6*s.* per bushel, firing "like I have."
Williton -	,, Risdon, Manor farm, Timberscombe.	6*s.*	Cottage and garden.	1 quart daily	¼ acre potato-ground, run of a pig, grist corn at 6*s.* a bushel.
,,	J. King, Esq., Cutcombe - -	8*s.*	Cottage	—	Grist corn at 6*s.* per bushel.
,,	Mr. G. Risdon, Higher Marsh, Dunster.	8*s.*	—	3 pints daily	Grist corn at 6*s.* per bushel, half their firing, potato ground.
,,	,, Gibbs, Carhampton - -	9*s.*	—	3 pints daily	Potato-ground.
,,	,, Oatway, Withycombe - -	8*s.*	—	3 pints daily	Potato-ground, grist corn at 6*s.*
,,	,, Charles, Dibble, Clatworthy -	8*s.*	Cottage and good garden.	Some cider	Grist corn at 6*s.*, turnips, run of a pig.
,,	,, Corner, Sampford Brett -	10*s.*	—	—	"Anything they want in the way of turnips, straw, &c."
Taunton -	,, Follett, Bishop's Lydeard -	9*s.* 6*d.*	—	3 pints.	——
,,	,, Hancock, Halse - -	9*s.*	—	,,	——
Chard -	,, Hull, Chillington - -	9*s.*	—	Cider.	——
,,	,, Paull, Ilminster - -	10*s.*	—	—	——
Yeovil -	,, Woolcott, Montacute - -	9*s.*	—	Cider.	——
,, -	,, Peren, South Petherton -	10*s.*, which is 1*s.* more than in the district generally.	—	,,	——
Langport -	,, Snook, Somerton - -	9*s.*	—	,,	——
,,	,, Nutt, Compton Dundon -	9*s.*	—	½ gallon of cider.	——
,,	,, Bond, Kingsdon - -	9*s.*	—	Cider.	——
,,	,, Fry, Curry Rivell - -	10*s.*	—	—	——
Bridgwater	,, Jeffery, Huntspill - -	10*s.*	—	Cider.	Garden and lets potato ground.
,,	,, Biddicombe, Shapwick -	9*s.*	—	½ gallon daily.	——

2.—EDUCATION.

Difficulty of restricting boys' labour to any fixed age.

26. When I first began my tour of inspection in the east of Somerset, I fancied it would be easy to fix some age prior to which children might not be allowed to work, or if allowed to work only allowed under certain restrictions, similar to those placed on factory children; but as I went farther and farther west I began to see what great difficulties lay in the way of any such legislation. In the country east and north of the Mendip Hills it seemed to me that it would be no great hardship to the labourer's family to draw a line at 12 years of age; but in the neighbourhood of Taunton, and on the slopes of Exmoor, I found that while wages are what they are it would be very hard to restrict a sturdy boy of 10 or 11 years old, who requires much food, from supporting himself, which he is then fully able to do. On the ground of health early labour cannot do boys much harm. I had a few complaints of over-fatigue while leading the plough horses all a long day, and of getting wet and soaked while bird-keeping, but as a rule I found a pretty general agreement that out-door work is good for boys. To ill-treatment they are never subjected; the parents take good care of that; nay, even in the schools they will sometimes take the boy away, if he is beaten by the master. If an employer ill uses him, they will speedily have him up before a magistrate. It is on the ground of want of education that most complaints are made about boys going early to work, and the more the value of education is appreciated among the labouring class the louder the complaints will become; but it is a very distressing fact that in many districts boys are being now taken from school earlier than they used to be taken. The Rev. Mr. Vassall, of Hardington Mandeville, told me that he has hardly a boy over 8 years of age in his school, and the reason given is that with the constant migration of the older and more able hands much of the labour formerly done by young men now falls upon big boys, and the work of big boys is done in consequence by the smaller boys.

27. In such a parish as Hardington, for instance, it would be a very great hardship to keep boys at school till 12 years of age—a great revolution in fact that could hardly be worked out. In such parishes it seems that personal influence is the only power that can be brought to bear; where there is an active clergyman or a good squire boys will generally be found remaining at school one or two years longer than in a neglected parish; but it is only in the smaller parishes where the clergyman can bring his influence to bear on each individual that personal influence can really work. It is in the larger parishes, and on the outskirts of small towns in agricultural districts that the people are more behindhand and the children not so well educated.

Antagonism of farmer and clergyman on

28. There is generally a sort of struggle going on between the clergyman and the farmers, the former endeavouring to keep the children at school, the latter to get them out to work. Farmers do not see

K.

the good of what they call over-education; it raises a man above his work; he thinks himself fit for higher employment, and goes away to the towns or railways; consequently there is a scarcity of labour, and men who stay behind are less fit for their work than those who migrate, and require the same, nay even higher wages. What wonder then if the law of self-preservation induces the farmers as a body to be against education? I found, however, some striking exceptions to the rule—At Witham Friary the farmers support the school by a voluntary rate, and here and there were individual men who were above class prejudices. But the majority will say that this system of over-education teaches the labourers more than their employers themselves know. subject of education.

29. This brings us to the subject of middle-class schools. Of such schools there is a great want; while there is ample provision in nearly every part of the county for the education of the labourer's child, needing only to be taken proper advantage of, there is next to none for the farmer's son. Some of the smaller farmers send their children to the National school, but among the richer there is a marked disinclination to send them to mix with people of a different class of life. I had the pleasure of visiting one admirable institution of the kind, the middle-class school at Failands, near Bristol, where farmers' sons are educated. There is a farm of 60 acres, where they can learn the practical working of their profession. This institution seems to have far better carried out the purposes for which it was intended than the Agricultural College at Cirencester. A few more such schools would be of great advantage to the farming interest. Middle-class schools.

30. With the low wages she and her husband receive it is but natural that, as soon as ever a child is capable of frightening a bird, the mother should come to the farmer and ask for work for him. The work is always given, though many a farmer will tell you such a boy is no real good, but that it is customary to employ the son of one of his own labourers; on the other hand, the mothers will often say the farmer requires the boy, and they do not like to refuse him. When Lady-day comes the clergyman knows as well as possible that the school will be half deserted, and it becomes his object to induce as many parents of children as he has sufficient influence over to suffer their children to remain. He has a hard task to perform, for while he is urging the advantages of education he knows that those advantages, though real enough in themselves, do not appear as real to the parent's eye as to his own, and it is hard sometimes to be told such things as that if he (the clergyman) will pay the money the child would have earned, had he not been taken from work, the child shall come to school. Besides which, though the money payment is small, still there is a money payment for schooling to be asked for. On the other hand, the employer comes and offers money for the work the child will do; wages are low, times are hard, there is a large family to be supported, and the natural result follows, the child is taken from school, and if he does return in the winter has forgotten all he has learnt; very likely he gets regular work, and never comes back to school again. Comparative advantage of education and employment in parents' eyes.

31. Forgetfulness is one of the great evils complained of by teachers; a few weeks often suffice to make a boy forget nearly all he has learnt. What wonder then if a boy taken from school at 8 years of age, and never sent inside its walls again, utterly forgets all he has learnt? at that age few boys read sufficiently well for reading to be any pleasure to them. Several boys, who had been at school, when younger, told me that they could not now write their names. Forgetfulness.

31a. Opinions differed very much as to how long a boy must be kept at school to enable him to leave it sufficiently well grounded in the elements of education to find such grounding of any subsequent use to him. Most of the clergy said that a boy required to be kept at school till 10 or 12 years of age for it to do him any good; but the Rev. Mr. Luttrell, of Minehead, showed me some admirable writing by a boy of 9, quite as good as some by a boy 2 or 3 years older, and at the Rev. Mr. Coles' school, I was told that at 9 or 10 a boy can read perfectly and write; at 7 he can read words of one syllable and some of two syllables, can write capital and small letters, and add and subtract up to 10. The Rev. Mr. Yarde, of Porlock, though saying that any such rule would be a great loss to several families in the place, thought no child ought to be taken from school under 10 years of age. He said that if sent to school at 5 years, and kept there till 10, they can learn quite enough. The Board of Guardians at Wincanton, though protesting against any limit being fixed at all, passed a resolution that, if any age is to be fixed by government, it ought not to be before 9 years. A year at that age, 9 or 10, is worth all that have passed before. Still it must be borne in mind that the resolution at Wincanton expressed pretty generally the sense of opinion in the west and south of Somerset: that if the boys of a family were debarred labour, the family could not get on at all under the present system of low wages. The earliest age at which a boy can leave school, having gained any advantage from it.

32. Under these circumstances the maintenance of a good school is very up-hill work, and great credit is due to those gentlemen, who in the face of such obstacles have succeeded; it is not to be done without immense effort, and when once done, great energy is necessary to keep up what has been done. In many parishes the day school has been supplemented by a night school, and so much good is done by an efficient night school, that it becomes advisable to recommend that such schools should be put on a footing of equality with day schools as to Government allowance and advantages. In most cases the number of scholars is very limited, but it must remain so as long as the burden of education falls almost entirely on the clergyman, or the day-schoolmaster or day-schoolmistress, already tired with a long day's work in the school. But there are many other difficulties complained of beside; for though it is one of the best features of the system that such schools are open to all ages, and men of 30, 40, 50 attend, the varieties of age very often become a drawback, the men and bigger boys not liking to seem to know less than the smaller boys, as must be very frequently the case. Then they come in from labour at a late hour, have their supper, and come off to school, and are naturally very much tired after a long day's work, so much so, indeed, that many of them fall asleep over their books. Again, with respect to the difficulty of finding a sufficient number of teachers, more teachers are required than for an ordinary school, for there is such a variety of acquirements among the scholars that it is almost impossible to classify them, and almost every scholar requires to be taught separately. Again, there is no Government allowance given for children under 12 years of age, and in a parish where children are taken away from the day-school to regular work at 8 or 9, it is very important that they should come to evening-school for the next few years, and not let their minds lie fallow up to the age of 12. There is a great want too of evening-schools for girls; generally there is only a staff available for the one school, and it is considered objectionable to mix the boys and girls, owing to the supposed evil Night-schools. Difficulty of combining night schools

K.
for boys and girls.

results of dismissing them to walk home together in the dark; evil results that make some clergymen object even to evening church-service. On the other hand, in the peculiarly argricultural districts, girls are kept longer at school than boys, and a night-school is consequently not so necessary in their case; but in the gloving districts the case is different; there the girls are taken away from school fully as early as the boys, and there are many of them growing up utterly uneducated.

Arrangements of a night-school.

33. The usual arrangement of a night-school is to keep it open for about 20 weeks in the winter months, two a week, and two hours a night; reading, writing, and arithmetic are generally taught; in some schools the elements of geography and Scripture; the attendance usually begins very well, but declines as spring comes on and field-work is more pressing.

Question of how far Factory Acts applicable to agriculture.

34. To encourage night-schools as much as possible, so as to enable them efficiently to supplement the deficiencies of attendance at the day-school, seems a more practicable way of spreading education among the children of the labouring population, than to apply the Factory Act or fix an age prior to which it shall be unlawful for children to labour. There was a lamentable want of practical answers to those important questions in the circulars, with which you were good enough to supply me, viz., those which asked how far it is possible to apply to agriculture the provisions of the Factory and Printworks Acts; usually no answer was given; when given, it was with few exceptions a statement that they were utterly inapplicable, without any reasons assigned. Farmers, whom I consulted on the subject, said that as a rule there are not enough boys as it is, and it would be a great hardship to make necessary a number twice as large as the present by adopting a half-day or half-time system. In many cases I was told that practically the Printworks' Act works in agricultural districts, for that it is only in summer months that there is work for children; in winter there is none, and they can go to school; but the fact is, that having once gone to work they get regular work, living in the farm, perhaps, or doing odd jobs about the place all the winter, and when once they have passed the bird-keeping age, hardly ever come back to school at all. The Rev. Mr. Vaughan, of Wraxall, with whom I had the pleasure of a long talk on this subject, made what seemed to me, if it could only be carried out, a very admirable suggestion, viz., that "no child under 12 years of age should be permitted to be em- "ployed in any agricultural work without a certificate that he can read without spelling any common "book, such certificate to be signed by the master or mistress of the school he has attended, the "clergyman of the parish, the minister of the chapel, or some householder in the parish, rated, say "above 20*l.* in the parish books, not being the child's employer; an appeal to the truth of the certifi- "cate to be allowed to Her Majesty's inspector of schools, or in the case of the Church of England "children to the bishop's inspector." Seeing, however, how the Small Workshops Act is daily eluded, it cannot but occur to us how very difficult any such plan would be to carry out, when we recollect that it would need inspectors in a scattered neighbourhood, who would labour under disadvantages unkown to a factory inspector. Besides the objection that supervision is far harder to exercise in the country than in a town, it must be recollected that farmer and labourer would always consider it for their interest to elude it; for the interest of the employer it would certainly be to elude it, and it is to be feared that education is not yet sufficiently appreciated for the labourer to rate the benefits of education as highly as do the upper classes.

Causes of insufficient education.

35. The result of the present system is that in a parish of which care is taken there are very few children who have had no education at all; but there are generally a good many growing up with insufficient education, and forgetting the more the older they grow. Those who are utterly uneducated are generally the children of one or two families who do not bear a very good character in the parish, the parents being people who either spend every penny they can collect on drink, and grudge it to the school, or who having never been educated themselves, do not see what is the good of education to their children. Nothing but personal influence can diminish the number of such families, but it is being much brought to bear now. However there are still few parishes in which there are not children who have never been to school. Early labour, though interfering with the sufficiency of education, does not of itself forbid the elements of education; few children go to work before 7 or 8 years of age, and by that time they can have obtained a smattering of knowledge. The difference of education between the present generation and the past is most marked. The Rev. Mr. Cartwright, of Butcombe, with whom I talked long on this subject, assured me that it is impossible to make much of the older people; he must train his people by getting a hold of a few members of the rising generation, and winning an influence over them. It is an extraordinary fact how great a change the influence of an energetic man can work in a parish in a few years; but it is much to be regretted that if after his death or departure the people fell into less efficient hands, his good work is undone in far less time than it took him to do. Parishes in which great ignorance prevails, such as Wiveliscombe, Nunney, Compton Dunden, all owe it materially to the lack of personal influence of clergyman or squire.

3.—Cottages.

General state of cottages in Somerset.

36. A special complaint that I found urged by all classes alike was the deficiency of cottage accommodation throughout the whole of the west of England. In this county it is not an uncommon thing to find large families brought up in a cottage of two rooms, sometimes even in a cottage of only one room. At Butcombe a cottage was shewn to me, in which a man and wife and a family of little children live, a mere lean-to against the wall of another house, with open thatch, and the sky visible through the thatch in many places. In Chillington were some nearly as bad. The worst cottages are generally the small freeholds, inhabited by the persons who own them, and who being unable to make more money than absolutely necessary for their immediate wants are too poor to afford repairs of any kind. Next to these the worst class of buildings are generally those belonging to small proprietors, such as tradesmen in towns, who have invested in them as a money-speculation, and to make it pay are forced to charge a high rent and spend little in repairs. The best cottages are usually those belonging to the larger proprietors, most of whom, from a wish either to see the estate present a flourishing appearance or to see their people well off, charge a rent far too small to repay them for their outlay; but it must be remembered that it is only a rich man who can afford such munificence.

K.

37. Mr. Ponsford, agent to Mr. Luttrell, informed me that he always tells Mr. Luttrell he must expect to lose by his cottage property; that no man can be liberal in such matters and yet make a profit; yet in a man of large landed property he looks upon it as a duty to hold a certain amount of cottage property; acting on which principle he induced Mr. Luttrell the other day to let him buy him some cottages for sale in Dunster, most of which place is Mr. Luttrell's property, cottages that were let by the outgoing proprietor at a far higher rate than he could ever suggest to Mr. Luttrell to ask. A pair of these cottages had been let at 5*l.* yearly; for these he had to give 80*l.*; repairs were needed at once, and yet he thought it right to reduce the rent to 3*l.* In the present low state of wages it is almost a hardship to ask 1*s.* 6*d.* a week for a cottage; most of the farmers who have cottages on their farms let them to their men at 1*s.* a week, and the same is usually asked by the more liberal proprietors who have their cottages in hand. To make cottage property pay, a rent of 6 to 7 per cent. on the outlay is necessary. Suppose a cottage built to be let at 1*s.* a week, and let at 6 per cent on the outlay, it must be built for 42*l.*, a sum for which it is impossible to build a cottage fit for human habitation. Good cottages, built in pairs to make them cheaper, and provided with three bedrooms, which universal opinion is now beginning to think necessary, vary in Somersetshire in price from 200*l.* to 300*l.* A gentleman of large landed possessions in the far west, who has been building and repairing his cottages all through a long tenure of the property, was good enough to let me see his cottage account, and join me in a very careful perusal of it. The conclusion we came to was, that after the value of repairs had been deducted, and a calculation made of arrears of rent unpaid, there was no balance left for the proprietor at all, for the repairs swallowed up the whole of the rent. His cottages were let for various sums, some as low as 1*l.* a year, few more than 1*s.* 6*d.* a week. Consequently for every new cottage he builds he is out of pocket by the value of that cottage; for say he builds a cottage of the value of 125*l.*, and lets it at 3*l.* a year, he only makes 2½ per cent. on his outlay, and a sum equal to that is to be allowed for the average annual value of repairs.

Cottage property cannot be remunerative.

38. Sir Alexander Hood, who builds his new model cottages of red brick and tile from Bridgwater by contract, calculates that he puts up a pair for 300*l.*, 50*l.* or 60*l.* of which are expended in an out-building, containing the copper, &c., for he thinks it a bad thing to have steam in the house. The cottages are plain, though neat, for he considers that they lose in strength wherever the roof is broken, so there are no gables, and the only break is where the chimney rises. He lets them for 4*l.* a piece, rather more than 2¾ per cent. Lord Taunton's model cottages, built of red stone found on the spot, cost 220*l.* a pair, besides pig-sty and privy, which are away at the back of the garden. They are perfectly square, according to a plan of his agent, Mr. Robertson, the block of two measuring 48 feet by 24. Mr. Robertson thought they were a little too small, and is going to build some 54 feet by 27, of which he calculates the cost at about 10*l.* more. The present cottages are let at 3*l.* a piece. Mr. Birmingham, agent to Sir Thomas Acland, told me that he calculated the value of a pair of three bed-roomed cottages at 200*l.*, but the stone is close at hand, and the estate provides timber. They are all thatched, Sir Thomas preferring thatch for the picturesque effect. Bridgwater tile would be delivered on the ground cheaper. Some of the best cottages I saw in Somerset were those that had been converted from old farmhouses; as the farms were enlarged many of the smaller farmhouses fell out of use, and have been divided into pairs of cottages. In most of these, though the roofs are low and the windows small, the rooms are more spacious than in the modern cottages. It is a great question whether the people themselves do not prefer one large bedroom for the whole household to sleep in to the same space cut up into three bedrooms for decency's sake. The one big room they generally divide with curtains and screens, which, though not ensuring privacy to the same extent as partitions, have the advantage of being removeable at pleasure. I visited with Sir Alexander Hood a very good new cottage with the bedrooms divided, in which were living a labourer and his wife and family. They were only there temporarily, while their own cottage, an old one with big, but few, rooms was undergoing repairs. He asked them which they preferred, and they hoped most earnestly they were to be allowed to return to their old cottage. Their ideas of comfort differed strangely from ours; the new cottage was superior even to the ordinary run of model cottages—in the old cottage the rooms were low, the windows small, and the floor up and down hill. A similar case came under my notice at Winsford. A husband, wife, six children, and a pair of old people lived all together in a cottage with but one bedroom and one sitting-room, and were all moved into a new three bedroomed cottage. They said there was not room in the new cottage for the old people, who remained in the old cottage. The fact was that the new bedrooms were small. In the old cottage the one bedroom had been very large, and they did not appreciate the advantage of separate rooms. It is very much to be deplored that they do no not see in the same way as we do, that a sense of decency demands separate rooms for the boys and girls, and that the parents should have a room apart from their children. Unless it is positively stipulated no lodgers are to be admitted, the third room is too frequently given to one, and the prohibition is often eluded in cases where there is such arrangement by a pretence that the lodger is a relation or a visitor. Mr. Ward, Sir Arthur Elton's agent, informed me that where there are three bedrooms they will often fill the house with lodgers, and herd with the whole family in the kitchen. Where there was no lodger, I saw in most cottages I entered that the third room was unfurnished, and used as a store room for potatoes and other vegetables.

Sir Alexander Hood's cottages.

Lord Taunton's cottages.

Converted cottages.

The people scarcely appreciate the new model cottages.

Lodgers.

39. With regard to the question of making cottages pay their landlord, and at the same time be fit for habitation, I scarcely received any answers to the circular of questions. The most practical suggestion was that offered by Mr. Porteous, Lord Cork's agent. He did not see why, as is always the custom at the present time, at which there is a great move in favour of the erection of model cottages, the price of building the cottage should come out of the pocket of the tenant for life. A good cottage when built will last with judicious repairs 80 to 100 years, and Mr. Porteous thought that the present owner should be empowered to raise money on the land for building necessary cottages, not on the principle by which money could be borrowed from Government to be paid back in 22 years, which, on striking an average of the duration of a life's possession, would almost all fall on the present possessor, but so that a great part of the burden should fall upon his heir. I saw at Clevedon some cottages that had been built with money borrowed from the Lands' Improvement Society. Mr. Ward, under whose superintendence they had been constructed for Sir Arthur Elton, did not seem in favour

K.

of the plan. The plans have to be submitted to an inspector, and the society are very particular in trivial points of detail, besides which they are obliged to charge such a per-centage as will enable them to pay a dividend to the shareholders. The plan and elevation seemed good, but the expense

Gardens.

was great, and the whole affair naturally a very losing business for the proprietor. The only other valuable suggestion besides that of Mr. Porteous is to let with each cottage a considerably larger garden than is the present custom, so that the labourer shall be able to sell the product of his garden, and be able so to pay a higher rent. But against this there is to be set down that they will be liable to leave their other work earlier, which the farmers will not allow. After all it seems that the cottage must be considered in the light of a part of the farm buildings, from which the landlord expects no return except in the shape of part of the rent of the farm.

Pulling down cottages is going out.

40. Partly owing to the Union Chargeability Act, and partly to the increasing sense of responsibility among proprietors, the custom of pulling down cottages, to force the people to live in the villages, and come out to labour in the farms, is disappearing rapidly. In a country which is chiefly pastoral it was a great disadvantage to the farmer to be left at night, as was the case with some, with a large stock of beasts, and not a soul, except his family, to look after them. It bore more hardly on Somerset than on a county of greater arable extent. But now it is becoming an exceptional case to find a farmer who has not at any rate two cottages on his farm, one for the herdsman, the other for the

Ownership of cottages.

carter and the majority have more. As to the ownership of the cottages the landlords are now trying to get them as much as possible in hand, with the exception of the two for the shepherd and carter, which most are agreed in thinking should be let with the farm. They consider that it leaves the labourer less at the mercy of his employer. But the farmers, naturally, do not like it so much; they naturally wish to have a hold over their people. The people themselves, as a rule, would rather hold directly of the landlord, but if not of him would rather take a cottage of their employer than live in the village; for they are nearer to their work, and seldom pay a landlord or employer more than 1*s.* a week, whereas in the village they cannot often get a cottage under 1*s.* 6*d.* most of the cottages there, unless it is a close parish, belonging to some small proprietor, who must make his house property pay.

Deficient cottage accommodation,

41. Boards of guardians were very energetic in their wishes that Government would do something to improve cottage accommodation. Clergy and farmers alike combined in saying that the bad cottages were the crying evil of the country; that as long as the people herd together in small dirty cottages you cannot expect to raise their moral or intellectual condition. The problem is most difficult to solve. A labourer has 8*s.* or 10*s.* a week, and to be able to afford the very worst cottage that is now thought fit to live in he must have at least 14*s.* or 15*s.* a week. The only means by which he gets on at present is by living in a cottage unfit for human beings, or living on sufferance in a model cottage, for which he does not pay more than one-third of the market value. It is, however, to be very much feared that the labouring class are not fully sensible of the degradation attending the fact of all ages and sexes sleeping together in one room. I was often told that their sense of delicacy is not so fine as in a higher class; but if we wish to raise that sense it cannot be done as long as they live as they live at present. Everywhere were complaints of the low state of morality, a state generally

supposed to lead to immorality.

attributed to the overcrowding in cottages; to the labour in the fields it was seldom attributed. When I inquired why it was that the girls who laboured in the fields were generally a lower class, I was told it was not because they labour in the fields, but because they have tried service or other employment, or had a "misfortune," and fallen back afterwards on out-door labour. As a rule, the state of morality is lower in the gloving than in the purely agricultural districts; in both, the boys live at home till they marry and set up for themselves. In the gloving districts the girls stay at home too, and crowd the cottages, whilst in the agricultural districts they do not stay at home so much; most go out to service, and only a few stay at home for millinery or field work. Then in the purely agricultural districts there is no substitute for the system about Yeovil of girls leaving their homes,

Morals worse in gloving districts than in agricultural.

and setting up gloving on their own account. But in such districts there is a good deal of immorality among the farm servants, who assist in the dairy work with the men and boys, and being left much with them the usual consequences result. As a rule, if a child is coming the father will marry the girl, and generally before the child is born; in fact, it is considered almost a point of honour; but when the father is in a higher class, as sometimes happens, a young farmer for instance, her character is lost. If too, through negligence and delay, as sometimes happens, the child is born before the

"Misfortune."

marriage, the father will often try to fight off, for the other girls jeer, and he does not like that. Still even in the case where a child is born before marriage it is thought more a misfortune than a fault, as the term "a misfortune," generally used in such cases, implies, and so leniently is it regarded, that after the girl has been home to be confined the farmer in whose service she has been employed will generally take her back, while the child is kept at home by the grand-parents, and just as well treated as if born in lawful wedlock.

The Rev. J. King on immorality.

42. The Rev. Mr. King, of Cutcombe, who was very strong on this subject, writes:—"Having had a "long and intimate acquaintance with the habits of the labouring class I am able to speak with some "degree of accuracy. The principal immorality exists among young people about to be married, "who think there is neither guilt or shame in such conduct; so little harm do they see in this form "of immorality that they will quote Scripture against you in their favour. 'Let them do what they "'like—they sin not—let them marry.'" It seems to be a pretty well-established fact that though the number of illegitimate children born in the county is not large, the number of women married who

Attempts of the clergy to check it.

are not about almost immediately to become mothers is very small. To check this evil various devices have been adopted by the clergy in various parishes. The wife of one clergyman offered to fit out the bedroom with washhand-stand, table, &c. in every new establishment where the woman was not married pregnant. She thought she had found a case at last, and fitted out the room accordingly, but only two months after the marriage almost the first use to which the basin was put was to christen a baby. The Rev. Mr. Carter, of Kingston, refused to church the woman in such

Not so bad a form of immorality as in towns.

cases, though he knew such refusal was illegal. He found himself in a scrape on this account once, but public opinion stood by him. After all it is a question whether it is not better that such a form of immorality should prevail than that common in towns. At any rate, it is not a worst form; and it

is so thoroughly established a custom now that, even if improved cottage accommodation ever have any effect in putting a stop to it, it will be only gradually that it will do so.

Early marriages and consequent poverty.

43. Early marriages are a great disadvantage, but under the present system of morality they must prevail. Men marry at from 18 to 22 years of age, girls younger, and generally must do so to save themselves. They begin very poor, taking a cottage, and being forced to borrow money to buy furniture, and perhaps not getting out of debt for years, perhaps never at all. It is during the first few years after marriage that the greatest poverty prevails, while the mother is herself often unfit for work, and the children are too small to earn anything. When the children cease to come so often, and the mother can herself work, and the elder children are beginning to be able to do so, the family begins to be more prosperous; but such prosperity is in the agricultural districts entirely dependent on out-door labour.

4.—Gloving.

44. In conclusion, I have ventured to append a short statement on the system of sewing gloves that prevails extensively among the wives and daughters of the agricultural labouring class in a large extent of this county, and which seemed to me to demand interference far more than the actual field labour.

District in which gloving prevails.

45. Gloving prevails principally in the four unions of Chard, Yeovil, Langport, and Wincanton, and spreads also slightly into the unions of Taunton and Bridgwater. A line drawn from the Blackdown Hills at Corfe through Taunton, Durston, and Middlezoy, along the line of the Polden Hills, and out to Castle Carey and Wincanton, would form the northern boundary; and Yeovil, Stoke, and Milborne Port are the chief centres of the trade. Taunton is to a smaller extent a centre, but employs few women in the parishes north of itself. The overseer at Bishop's Lydeard expressed a wish that he could introduce it in that parish. Gloving is generally to be found extending further along the line of the high road than in the intermediate districts. Where it prevails, scarcely a woman is to be found engaged in out-door work; it is difficult to combine the two, as a softness of hand and delicacy of touch is required for sewing gloves that soon disappears in manual labour, and gloving is naturally most often preferred as the more remunerative employment.

Effects of gloving on education.

46. Thus, in all the above-mentioned districts scarcely a woman or girl works out, but the girls are taken away from school at as early an age as the boys, often younger, and when once that is done, they do not, as do the boys, come back sometimes for the four winter months, but take to gloving as an occupation. They begin now at 7 or 8 years of age, some even earlier. They begin earlier than they used to. In one house I visited I found a small girl at work, and was told she had begun at 5 years of age. The woman, in whose house she was working told me that all her own children began at 6 or 7; another woman that she had herself begun at 6. It is obvious that to take children away from school so young as this interferes terribly with education, and it is very difficult to bring the Workshops Act to bear, as the work, not being done in factories or workshops, but in private houses, is far more scattered, and it would be very great labour to seize upon each individual instance of the infringement of the Act. On this subject Mr. Tregarthen, Her Majesty's inspector of schools, is at present engaged in getting up statistics. Many children also, who are at school all day, work at gloving all the evening. When I visited the school at Shepton Beauchamp, the mistress, who was teaching the first class, told all those who glove in the evening to hold up their hands, and every girl, even a little thing of 8, held up her hand. She worked every evening from 5 p.m. to 9 p.m.

Evil effects on health.

Injury to the eyes.

47. But besides the hindrance to education, there is the damage to health and morality to be considered, subjects on which I gleaned a good deal of valuable information from Dr. Wills, of Crewkerne (Appendix 134). The constant concentration of the sight on a small machine is acknowledged by the glovers themselves to be most injurious. They use a brass machine which holds the glove in a vice, and has a row of little holes close together, through which the needle passes, and which keeps the stitches regular. They will all say that the reason that the machine is bad for the eyes is that the brass dazzles them, especially at candle-light, at which time so injurious is the effect that many have to leave off altogether. Dr. Wills, however, does not so much attribute such bad effect to the brass being dazzling as to the holes being so close together, that when they have been working long many of the glovers find that all the holes seem to run into one. He thinks that if the holes were of different colours the eyes would not suffer so much. He showed me one very painful case of a girl of 14, who had quite lost the use of her eyes; she was evidently far gone in consumption also, and the mother said that, though all her children "glovey," this was the only one whose eyes had suffered. Dr. Wills explained that she being naturally a delicate child, the disease had attacked the part so much used, but said that it was an unusual case. In another cottage we entered was a little girl, of 8, a "learner," who had just worked a twelvemonth. At first she used to miss stitches, and the woman teaching her thought it was laziness, and proved her, but she found when candles were brought that her eyes were bad, and she has to leave off work sometimes, and cannot work at all by candle-light. "Some eyes do fail; my own are not as strong as they were."

"Learners."

48. Girls are "learners" for 12 months, for the first three of which they receive no pay; after that they are paid regularly, but overlooked. They work usually, I am speaking of those about Yeovil now, in the cottage of some agent or overlooker, up to the age of 14 or 15 years of age, when they go to work at home, paying their mother 2*s.* 6*d.* out of their earnings, and doing what they like with the rest. We visited several cottages in East Chinnock, where the younger ones were working; in one there were 11 girls at work, besides which some women came in a friendly way to finish off just before the overlooker started with the finished gloves for Stoke. All were sitting in rows at their machines. The atmosphere was very stuffy, as was natural with 15 to 20 persons in a small room, but it was a clean cottage, and belonged to a respectable woman. Not all of the employers however treat the children well. A girl at Ilchester complained that her eyes had suffered, that she could see well at the beginning of the week, but at the end all the holes seemed run into one. When her eyes felt bad the woman would not let her look up, and thought it was laziness, so used often to bang her on the head as a hint to go on.

Gloving agents.

49. The system of agencies is new, and seems to have been, on the whole, a great improvement. Before it was adopted the woman and girls themselves used to have to walk once a week into the town where

K.

their employers resided, often as far as 10 or 15 miles, and wait about till their turn came to have their gloves examined. Many of them were kept waiting till 9 or 10 o'clock at night, and did not get home till early morning The consequences to health with people tired and ill-fed can readily be imagined. The gloves were severally examined, and those that were found to contain a fault were returned to them, and the full value deducted from their wages, and when it is recollected that the market value of one pair of kid gloves is greater than the sum paid to a glover for sewing a dozen pair, and that many of them cannot sew more than a dozen or a dozen and a half pairs in a week, it must naturally have resulted that sometimes they received no wages at all. The system of girls bringing in their work has not however entirely gone out. I found it still about Ilminster, though there was no great distance to be walked, and they were not kept waiting a long time; and Mr. Cuthbert Raymond, a prominent manufacturer at Yeovil, told me that he goes down himself now to Langport, and takes a room there, where he receives the finished gloves from the neighbourhood, and distributes fresh gloves to be sewn.

Value of gloves.

50. The value of gloves varies. If we turn to the kid gloves, which are the principal manufacture, we find that some years ago as much as 5*s.* a dozen could be earned; but those halcyon days are past; the demand for gloving has increased so among the labourers' families that no more than from 2*s.* to 3*s.* a dozen pair can be earned. Mary Eyres, at Ilchester (133) told me that the price she obtained was 2*d.* a pair; the agent received from the manufactory 2*s.* 2¼*d.* a dozen, and the odd 2¼*d.* went to herself, the 2*s.* to the gloving girl.

Abuse of agencies.

51. This system of agencies is, however, very liable to be abused; an agency is very often obtained by the small shop, grocer's or general shop, and the gloving girls will be expected to take out part of the wages in tea, dress, &c., the agent being herself paid in money, and able to put her own price on the wares she sells to the girls employed. For sewing the backs of cotton gloves Mr. Southcombe, at Stoke, gives 5½*d.* to 8½*d.* a dozen. Miss Adams, a girl at East Chinnock, and a very fast good worker (Appendix 135), told me that she has made 24 pairs of kid gloves a week at 2¼*d.* a pair = 4*s.* 6*d.* a week!; she has done as many as 34 pairs in a week, but that was working a day and a half each day; and it is hard to earn more than 3*s.* 6*d.* a week. At the Yeovil Board of Guardians there was a discussion as to how much a woman could earn in a week at gloving; the manufacturers set it down at 6*s.*, but the farmers did not think half so much, and though an average was struck at 4*s.* the farmers still said that that was outside the mark. Though a girl working hard all day and every day may make as much as 4*s.*, it must be recollected that a woman with household duties to perform besides will probably make scarcely half as much.

Overwork at gloving.

52. In busy times when there is a great demand the glovers are liable to be very much overworked; a younger sister of the girl mentioned above (Appendix 135), only 10 years of age, would sit and work all day, sometimes for 18 hours, and this was in her mother's house. The Rev. Mr. Salmon (Appendix 137) remarks that the number of hours of work at home is often far beyond the number in factories. The girls cannot afford to take a long time for meals, but sometimes get up and run about for a few minutes. One little girl, at Somerton, 14 years of age, told me that she works from 8 in the morning till 9 at night, and never has a holiday; another, only 8 years of age, who began to "glovey" at 5, that she works with her grandmother from 7 in the morning till 8 at night; and a third, 11 years of age, who likes doing it, that she works from 9 in the morning till 11 at night; never has a holiday, and never goes out while working. This last girl has a little sister of 8, who "gloveys" too and nurses the baby when tired, but she herself never nurses the baby, except on Sunday.

Consumption among glovers.

53. It stands to reason that a child must feel the worse for sitting so long and so continuously, but I did not hear of any special complaints at all peculiar to glovers, or that prevail more among them than among other persons engaged in sedentary occupations. It must be remembered that they are not so highly fed as persons of a higher class engaged in such occupations, and therefore are less likely to suffer from indigestion and similar illnesses. But the chief disadvantage, next to the injury to the eyes, results from so continuous a stooping posture; most of the women will be seen to have more or less of a stoop, and are narrow-chested. Dr. Wills informed me (Appendix 134) that there had been a doctor down some time ago trying to collect statistics about consumption, chest diseases, &c. among the poor glovers, supposed to come from sitting in a cramped attitude over the machine; but he himself attributed what consumption there is to that habit, formerly so common, but now going out, of having to walk once a week, without respect of weather, 6, 8, or 10 miles to the gloving place to have their gloves examined; being often kept out hours in the rain waiting for their turn, and having afterwards to walk home on wet nights. Mrs. Sweet, at High Ham (Appendix 171) said that though she "gloveys" herself, and has "gloveyed" for 30 years, she does not like her girls to do it. She thinks it bad for the health to sit so long without exercise; one fell sick and, in her opinion, died of it, and she pointed to another sickly looking girl sitting over the fire, and said that she had suffered from it too.

Character borne by glovers.

54. With respect to the general character of the gloving girls, the Rev. Mr. Salmon, of Martock, who was good enough to write me a special report on the subject, remarks that, "As a general rule, they "begin work at 8 or soon after. They grow up in a state of deplorable ignorance, very few of them "being able to write their own names. At an early age they become independent of their parents, "and submit to no control, even when it is exercised judiciously. The evil-disposed at once go out "to lodge, if their parents will not allow them to keep late hours; their morality is very low, their "ignorance excessive, and their language and behaviour often very rough and coarse. Sunday schools "do a little for the best of them, but the roughest will not attend them, as they are ashamed of their utter "ignorance, and impatient of any control." It is very painful to think that though the district is blessed with a more fertile soil than any other part of England, and affords more variety of and more continuous employment than any other part of Somerset, the morality of this part is lower than that of any other part of the county. The simple cause seems to be this, that there is more overcrowding of the cottages. In the purely agricultural districts girls go out to farm service, and few are at home after 13 or 14 years of age; in this district few go out to service; they like the independence of gloving, and either they stay at home and crowd the cottage or go out to lodge, and worse forms of immorality result. I was surprised at hearing from many competent witnesses that the women who work in the fields bear a higher character, as a rule, than either the glovers or the factory hands. The

Rev. Mr. Evans, of Merriott, a large parish, where the female population is pretty equally divided among these three classes, assured me of the fact. The factory hands get together after dark on returning from work ; the glovers at 15 or 16 get habits of independence of their parents. The glovers too make very useless wives in most cases; many of them have never learnt to make a bed or light a fire, for constant work gives no time to learn domestic duties. Doctor Wills told me a case of a girl who had a great wish to go out to service, and was found when in her new place not to know how to make a bed. She had always lain in bed while her mother rose and lit the fire and did the household work, and then risen and gone to work.

Ill-adapted for domestic duties.

55. While on this subject it may be as well to mention other cases of infringement of the Small Workshops Act that came prominently under my notice, either due to the negligence of the proper authorities to take action, or their ignorance as to whether they have the power.

Infringement of the Workshops Act.

56. At Pawlett, while not complaining of the labour of children in the fields, the Rev. Oland Crosse said that interference is much wanted in the brickyards, where children of 6 and 7 work barefooted in the clay. I had a like complaint from the schoolmaster at Clevedon.

Brick-fields.

57. At the request of the Rev. C. S. Grueber, I visited in his parish, Hambridge, a button-hole establishment, where from 30 to 40 girls between the ages of 8 and 12 work all day and never go to school. I was unfortunate in timing my visit on a day when there was a holiday, but Mr. Grueber subsequently wrote to me a letter containing more particulars on the subject, which I have printed in my Appendix (189). It appears that some children begin as young as 7 years, and work about 12 hours every day ; in the summer longer. He considers that they will be left without any education at all, and that unless he can get some of them to school, it will be no use keeping a school at all. He is willing to give every accommodation as to hours of attendance at school as may best suit the young person who employs the children.

Button-holing at Hambridge.

58. In conclusion, I must apologise for having wandered considerably wide of the immediate objects of our inquiry, in discussing the state of wages and the condition of the glovers in the south of Somersetshire ; but I found both subjects so inseparably mixed up with the question of the employment of women and children in agriculture, with the state of the education of the children, and with the want of cottage accommodation, that it would have been impossible to discuss any of these subjects without lengthened digressions into the general state of poverty, and the attempts to supplement wages by carrying to extremes such employments as gloving.

I have the honour to be,
Gentlemen,
Your obedient servant,
ROBERT F. BOYLE.

June 1869.

REPORT by Mr. J. HENRY TREMENHEERE on CUMBERLAND and WESTMORLAND.

Table of Contents.

	Page
I. Description of the district:	
Cumberland and Westmorland the last of the English counties civilized	134
Influence of small farms upon the employment of children and women in agriculture	135
Westmorland a county of small farms	„
Rent of farms	136
Average rent of land in the two counties	„
Proportions of arable and pasture land	„
Westmorland not a corn-producing county	„
II. Employment of women in agriculture:	
Once very general in Westmorland	„
Has much diminished	„
High rate of wages the cause	„
Female farm servants still so employed	137
Employment of women in agriculture more general in Cumberland	„
Opinion generally against such employment	„
Farmers opposed to legislative interference	„
III. Public and private gangs:	
Public gangs in Cumberland	„
Private gangs in Cumberland and Westmorland	„
Require to be placed under regulations	138
Work on farms often done by contract	„
IV. Farm servants and agricultural labourers:	
Cause of the general employment of farm servants	„
Scarcity of cottages	„
Farm servants a peculiar class	„
Little immigration of labour	„
Slow increase of population	„
Wages of farm servants	„
Mode of living	139
General efficiency	„
An independent class	„
Immorality in farmhouses	„
The system acts as a discouragement to marriage	„
Hiring fairs, and their evils	140
Wages of agricultural day labourers	„
Cause of high wages	„
Comparative cost of farm servants and day labourers	„
Evils of the farm servant system	„
The "terms" of farm servants	„
Savings of farm servants	141
Benefit societies occasionally used	„

	Page
V. The "statesmen" of Cumberland and Westmorland:	
Their origin	142
Still numerous	„
Causes of their decline	„
Their bad farming and hard living	143
Influence of small estates on the education of the children of the proprietors	„
VI. The small farmers of Cumberland and Westmorland:	
Predominance of small farms	„
The number gradually diminishing	144
Hard lives and bad husbandry of small farmers	„
Defective education of small farmers	145
Rate of wages paid on a large farm in Westmorland	„
Cost of labour per acre	„
VII. Farmhouses and cottages:	
Many farmhouses deficient in proper sleeping accommodation	„
Cottages generally bad	146
Instances of cottage improvement	„
VIII. Gardens and allotments:	
Gardens small and not appreciated	147
Allotments not generally needed	„
Often offered but declined	„
IX. Education:	
Satisfactory position of the counties in that respect	„
Education generally appreciated	„
Endowed schools numerous	„
If schools are not taken advantage of indifference of parents is the cause	148
Farmers favourable to education	„
Many endowed grammar schools not adapted to the present wants of the population	„
Reforms required	149
Industrial schools	„
Mr. Curwen's at Workington	„
Its success	„
Value of children's labour to the parents of small farmers and statesmen	„
Hours of labour not objectionable	150
Suggestion of farmers in reference to education	„
Early labour not generally the cause of neglected education	„
Exemption of Cumberland and Westmorland from serious crimes	151

To Her Majesty's Commissioners.

L.

1. I have the honour to submit my report on the employment of children, young persons, and women in agriculture, in the counties of Cumberland and Westmorland into which I was instructed to inquire, for the purpose of ascertaining to what extent and with what modifications the principles of the Factory Acts can be adopted for the regulation of such employment, and especially with a view to the education of such children. The district assigned to me being one in which landed property is much subdivided, it was your wish that I should incidentally direct my attention to the condition of the remanent of the class of statesmen or yeomen for which these counties have been long known, and especially to the influence which small properties and farms possess upon the education of the children of their owners and occupiers, I accordingly made them the subjects of my inquiries, and the conclusions at which I arrived will be found embodied in this Report.

Peculiarities of the district.

2. These counties possess several remarkable social peculiarities. The minute subdivision of landed property which took place at an early period of its history is still one of its most prominent characteristics; there does not, therefore, exist that constant and general demand for the combined labour of children in agriculture which forms so marked a feature in the rural economy of some other parts of England.

Counties of small estates and farms.

3. Cumberland and Westmorland are counties of small estates and small farms. They are, as compared with other fertile and populous counties in which large capitals and scientific farming have long been applied to draw out the latent capabilities of the soil, with some notable exceptions, still in a somewhat backward condition.

Sparsely peopled.

4. They are sparsely peopled. They possess very few large resident proprietors. There is very little immigration, except for temporary purposes such as the construction of railways, and the great majority of the farm servants and day labourers are natives.

Probably the last civilized of the English counties.

Cumberland and Westmorland were probably the last counties of England to receive the impulse of advancing civilization. Their mountainous nature, their extensive commons and moors, their large tracts of cold and barren fells, their distance from any great centre of civilization, the general

L.

absence of markets and of manufactures long continued to impress upon them a character of social isolation. The roads less than a hundred years ago were little better than traversed ruts and many were merely dangerous tracks over commons. A few sheep and herds of the poorer breeds of Irish and Scotch cattle grazed upon the mountains and fells, while thousands of acres were lying waste, not so much from natural barreness as from the want of capital and enterprise to bring them into cultivation. The highest aim of the small owners and occupiers was to feed and clothe themselves and their families from the produce of their land and to keep their half-starved stock alive through the long and inclement winters. Crops of stunted oats, barley, or rye were occasionally to be seen on the sides of hills and in the mountain dales, but wheat was an unknown grain; wheaten flour was imported and wheaten bread was consumed only by a few of the resident gentry, and by the better class of shopkeepers in the towns.

Long want of internal communication.

5. The want of internal communications compelled every farmer to grow a sufficient quantity of oats to provide meal for his family. The implements of husbandry were of the rudest description. Lean half-fed cattle were occasionally killed for food, but even as late as the end of the last century it was the practice of the butchers of Whitehaven to advertise in the newspapers their intention to slaughter a beast on a certain day. A side of bacon with a few dried legs of mutton formed the year's store of meat for the farm house, while oaten porridge, rye bread, and blue or skimmed milk cheese was the ordinary diet of the labouring men.

Commons formerly the chief dependence of farmers.

6. The chief dependence of the farmers was on the commons, and if one or two horses were kept they were expected to pick their own subsistence from the waste. Geese were the only description of stock that possessed any appreciable value, great numbers were kept on the commons, and a considerable profit was derived from their feathers and quills. Large patches of moorland were annually pared for fuel and for providing thatch for roofs.*

Rude state of agriculture continued until the end of the 18th century.

7. This rude and primitive state of society continued until nearly the end of the last century, when the attention of lords of manors first began to be directed to the enclosing of commons.

Continued progress since.

8. From that period the progress of these counties has been uninterrupted, and some districts will now bear a comparison with any portions of England for the skill and success with which farming operations are carried on.

Cumberland and Westmorland considered as one district.

9. Their physical and social features resemble each other so closely that I have deemed it expedient for the purposes of this report to consider these counties as one district. For certain purposes indeed they are combined. They possess between them but one lord lieutenant, one chairman of the court of quarter sessions, and one chief constable, and their moral is even more complete than their political and geographical unity.

Classification of farms, and their influence in the employment of children and women in agriculture.

10. The average size of farms in Cumberland is less than in any other of the northern counties, with the exception of Westmorland and perhaps a part of Lancashire. Large farms either of arable and pasture land or of both combined form the exception rather than the rule. Bailey and Culley, writing in 1805, say, "On the large estates there are some farms of from 100*l.* to 150*l.* a year, few reach "200*l.*, and we only hear of four or five that get as high as 300*l.* or 400*l.* a year, and only one of 600*l.* "The more general size of the farms is from 15*l.* to 28*l.* or 50*l.* a year."† The smallest farms are now found near villages and in the vicinity of collieries and iron mines, where occasional employment in carting offers inducements to many poor men to rent a few acres of land, and to endeavour with their aid to become independent. Very little time can therefore be spared from their work to cultivate their small holdings, which vary from four to 20 or 30 acres. This class of men can scarcely be called farmers, although they are occupiers of land. A more numerous class of farms consists of those of from 40 to 150 acres, which are either in the hands of small tenants or of their proprietors, the "statesmen" or estatesmen of these counties who generally cultivate their own land. The occupiers of from 200 to 1,000 acres are chiefly tenant farmers, and the farms are both arable and mixed, the land capable of cereal cultivation constituting, it has been estimated, about one-half of the area of Cumberland.

Small farms more numerous in Westmorland than in Cumberland.

11. In Westmorland small farms are even more numerous than in Cumberland, although there has long been the same tendency as in Cumberland to their gradual aggregation. Pringle, in his general view of the agriculture of this county in 1805 says, "Farms in general are so small that it is hard to meet "with one of 100*l.* a year rent, though there are some of 200*l.* or 250*l.* a year." From an inspection of the rate books of 62 parishes and townships in Westmorland, taken indiscriminately from the four wards into which the county is divided, and assuming that the same proportion exists in the remaining 47 parishes and townships, it appears, from a calculation made by the Rev. James Simpson, vicar of Kirkby Stephen, a gentleman to whom I am under the greatest obligations for his valuable assistance in prosecuting my inquiries in Westmorland, and whose communication‡ in the social and economical condition of that county will be read with much interest, that the total number of occupiers at the present time amounts to 1,405, of these—

803 hold from 50 to 100 acres.
432 „ „ 100 to 200 acres.
107 „ „ 200 to 300 acres.
33 „ „ 300 to 400 acres.
60 „ „ 400 and upwards,

the last being chiefly but not wholly hill-sheep farms. There are in this county 131 occupiers paying less than 50*l.* a year rent, but there are a great many statesmen still living in the county upon their patrimonial property, varying in value from 20*l.* to 150*l.* a year.

---

* See Nicholson's and Burn's History of Westmorland and Cumberland for the early condition of these counties.

† A general view of the agriculture of the counties of Cumberland and Westmorland, drawn up for the Board of Agriculture, London, 1794–5, by Mr. John Bailey, of Chillingham, and Mr. George Culley, of Fenton, Northumberland.

‡ See Appendix.

L.

12. The great majority of farms in Westmorland are under 100*l.* a year rent. In the Kendal union, taking all holdings rented at 20*l.* a year and upwards, the proportion per cent. is as follows:—

Farms under 100*l.* a year - - -	72
Above 100*l.* and under 150*l.* - - -	15
Above 150*l.* and under 200*l.* - - -	6
Above 200*l.* - - - - -	7
	100

Rent of farms in Westmorland.

Applying the same rule to the eastern union the proportion would be,—

Farms under 100*l.* a year - - -	78
Above 100*l.* a year and under 150*l.* - -	12
Above 150*l.* and under 200*l.* - - -	4
Above 200*l.* - - - - -	6
	100

the same proportion, it is believed, would be found in the western union, with perhaps a slight advantage in favour of large farms.

Average rent of land in both counties.

13. The average rent of land in Cumberland, I was informed by Mr. W. Dickinson, an eminent land agent at Workington, is about 20*s.* per acre; the average rent of good grass land is 50*s.* per acre; the average rent of arable land is 27*s.*, if such land is favourably situated, *i.e.*, in the vicinity of a town, about 50*s.*, decreasing according to quality and distance. There are, however, many thousand acres on the mountains not worth more than 3*d.* per acre. The average rent of land in Westmorland, according to Mr. C. Webster's estimate, is 15*s.* per acre, the average rent for good grass land is from 35*s.* to 45*s.* per acre; the average rent paid for arable land is 1*l.* per acre; and the average rent for arable farms in the neighbourhood of a town such as Kendal is 30*s.* to 35*s.* per acre. I may add that the average price of corn is higher in Westmorland than in any county in England.

Proportion of arable and pasture land.

14. *From an able paper on the farming of Westmorland written by Mr. Crayston Webster, land agent of Kendal for the Royal Agricultural Society of England, it appears that in 1868 one-tenth only of the gross area of this county was under the plough, and that of the 22,130 acres under cereal cultivation no less than 17,042 were in oats. There is very little cultivation in the mountain districts, the heavy rainfall and the generally poor quality of the soil being unfavourable to the production of corn. Oats were formerly grown to a greater extent than they now are, but the crop was always a precarious one, and the small farmer finds it cheaper to buy the grain that he requires than to raise it from his land. The demand for agricultural labour in these secluded districts is therefore very restricted; shepherds and a few men to tend cattle are all that are required.

Westmorland not a corn producing county.

15. The above figures plainly indicate that Westmorland is not a corn-growing county; breeding cattle and sheep and the production of butter and cheese form the chief stay of the farmers of that county, and Westmorland, having a smaller population in proportion to its area than any county in England (the number of inhabitants per square mile being only 80, while the average of England is 373), it will be evident that there is little scope for the employment on a large scale of children or women in agriculture, although they are freely employed in such occupations as the character of the cultivation admits. This remark applies in a less degree to Cumberland where the quantity of arable land is much greater than in Westmorland.

Employment of Women in Agriculture.

Employment of women in agriculture once common in Westmorland.

16. Pringle, in his view of the agriculture of Westmorland, published in 1794, says, "It is painful "to behold the beautiful servant maids of the district toiling in the severe labours of the field; they "drive the harrow and the plough, when they are drawn by three horses; nay, it is not uncommon to "see toiling at the dung carts a girl whose elegant features and delicately-proportioned limbs but ill "accord with such rough employment."

The employment of women in agriculture has diminished.

17. The employment of women in agriculture in both of these counties has considerably diminished within the recollection of many persons with whom I communicated on the subject. Bailey and Culley state that in their time more than half the carts in the county of Cumberland were driven by females, many of them under 20 years of age. I frequently heard farmers in Westmorland complain that women could not now be got to work in districts where such labour was a few years ago abundant.

The high rate of wages the cause of the diminution.

18. The high rate of wages in both counties has, to a great extent, removed the necessity which formerly existed for the wife to supplement the earnings of her husband by her own. The wives of agricultural labourers still generally assist at the hay and corn harvests, but they consider this work as a holiday, and field labour which entails exposure to wet and cold, and requires more exertion than women in general are willing to submit to, is left to a lower class which is found in towns, to girls of doubtful character, or to poor widows who gladly avail themselves of any employment to eke out their little means of subsistence. A farmer of Westmorland to whom I put the question whether he employed any women but his own farm servants in field labour, replied, he would willingly do so if he could get them, but that if he wanted a single extra female hand he should have to go to Carlisle, a distance of 30 miles, to hire her. That farmers should gladly avail themselves of female labour when they can obtain it is natural; it is comparatively cheap, and for certain purposes equal to, if not superior to that of men. There are several occupations in which women are more expert than men, and which the labourers of Westmorland and Cumberland would regard as a waste of their power and as derogatory to their manhood if they should be employed in them. The greater part of such work, as spreading dung, weeding crops, thinning turnips, and taking up potatoes, is still done by female farm servants and by extra women when they can be procured.

* Essay on the agriculture of Westmorland, Royal Agricultural Society's Journal, 1867.

L.

Female farm servants employed in field work.

19. There is probably scarcely a farm in either county in which the female servants do not contribute some portion of the outdoor labour, and the work demanded of them is often very heavy and unsuitable to the female constitution. I would direct attention to the communication of Dr. Tiffen, a gentleman of extensive practice in one of the districts of Cumberland where women are much employed, in which a strong opinion is expressed that they suffer considerably from exposure in the fields and from certain kinds of work which they are expected to perform. Loading dung carts is not only unseemly but involves an amount of exertion to which women are not generally equal; lifting and carrying heavy burthens, such as sacks of corn, tending cattle, treading down hay, pitching corn sheaves into the carts at harvest, or receiving and arranging them on the top of the rick, are all occupations more or less unsuited to their sex. A case was mentioned to me of a young woman having contracted a complaint from the hardships to which she had been exposed by working in a farmyard, and from which she died.*

Employment of women in agriculture very general in some parts of Cumberland.

20. I found the employment of women in agriculture very general in some parts of Cumberland, indeed, in some districts farmers seem to rely almost entirely upon the abundant supply of female labour which they can command. One of the largest farmers in the neighbourhood of Longtown, near the Scottish border, who rents 2,000 acres, chiefly under tillage, had not even thought it necessary to provide himself with a reaping machine, as he could get his harvest in with equal speed by women "shearers." In this town, containing a population of 2,300, almost every female capable of work, with the exception of a few who go out to domestic service, gains a living by field labour; and I may mention as a proof of the demoralizing effect of such labour upon the female character, that it was stated to me by the deputy chairman of the board of guardians, himself one of the largest employers of that labour, that the workhouse of the union in the district wherein women are so largely employed, has become little else than a great lying-in hospital.

Opinions against it.

21. Opinions were freely expressed in favour of putting a stop by legislation to some of the heavier and most unbecoming descriptions of female labour, particularly for girls under 18 years of age, under the impression that the very character of farm work has a tendency to degrade the moral nature of women, and that it unsettles and unfits them for domestic life. What they are constantly seeing and hearing in a farmyard must, it was often said, necessarily destroy all delicacy of character.

Farmers opposed to interference. Remedies for abuses best left to the influences of time and education.

22. I found, however, a strong feeling on the part of the farmers against any legislative interference with the employment of women, and many persons who had no pecuniary interest in the question frankly admitted the difficulties of dealing with even acknowledged abuses by law, believing that the practice would in time disappear under the influence of public opinion and the gradual improvement of manners. "As to the employment of women in the fields," writes Mr. George Moore, a gentleman to whom Cumberland is greatly indebted for his admirable schemes for the improvement of education, "I think that in another generation it will be discontinued, as I observe amongst the girls "educated in the schools in many parts of Cumberland that they show a decided aversion to "field work, and it would only be by those whose character was lost or who had not been regularly "to school that rough farm work would be chosen. In past years there was nothing done to "civilize or indeed to humanise the labouring classes of Cumberland, and besides, there were so "few resident gentry that they saw nothing of a more refined life; there was no opening for servants "in indoor places in their own immediate neighbourhood, and the greater hardships of out-door life "had greater wages and entire freedom to tempt them to follow in the way of life of their own "mothers."

Public and Private Gangs.

Public gangs partially employed in Cumberland.

23. It was with some surprise that I found the public agricultural gang system prevailing in parts of Cumberland. It seems to have been introduced about 21 years ago, and to have been adopted in several districts. At Penrith I discovered by the assistance of the police authorities that there are eight public gangmasters residing in that town, and seven women carrying on the same business. The gangs are composed, I was informed, of women, girls, and boys, but none under 10 years of age. The demand for these gangs, which generally consist of from 20 to 40 persons of both sexes, is continuous from March to the end of November, and about 300 children, young persons, and women who reside in or near the town of Penrith find employment in them. The Act of Parliament passed in 1867 for the regulation of agricultural gangs seems not to have been known in this district, and I availed myself of the opportunity which my presence at Penrith offered of assembling and addressing the gang-masters, of pointing out to them the consequences to which they had exposed themselves by violating the law, and of explaining its provisions. The men expressed their regret at having acted in contravention of the law, but said they had done so in ignorance, and promised compliance with it for the future. I also considered it my duty to call the attention of the magistrates of the district to the Act in question, and I received assurances that its enactments should henceforth be strictly enforced. I had no opportunity of seeing any of these gangs at work, the season for field labour not having commenced, but I was informed that the gangs superintended by women were far worse regulated than those conducted by men, the gang-mistresses generally setting a very bad example both in language and conduct to the children and young persons under their control. The attention of the magistrates having been directed to the subject of public gangs, these women will hereafter be obliged, in order to continue their employment, to apply for licences, which, as their characters are well known, will in most instances be refused. Some of these gangs go to work as far as nine miles from the town, but carts are sent by the farmers employing them to convey them to the spot where their labour is required, and they are sent back in the same manner.

Private gangs used in some parts of Cumberland and Westmorland.

24. I found private gangs much used in districts of both counties where large tillage farms prevail and where a sufficient supply of children could be obtained. Their principal employment is in turnip thinning under the superintendence of a farm servant. The work is done in West Cumberland by boys and girls of from 10 to 16 years of age who creep along the ground upon their hands and knees,

* See the evidence of Rev. J. S. Hodgson, Appendix.

L.

the knees being protected by leather caps, and who placing a finger on the finest plant at the proper interval, sweep out by a grasp with the other hand all the superfluous plants up to the one selected to remain. When properly instructed, three children can single an acre of turnips in a day.* A number of boys and girls of all ages creeping along the drills together upon their hands and knees gives rise, I have no doubt, to much impropriety of conduct. The posture of girls necessarily produces exposure, and the sexes should certainly be separated while engaged in such work.

25. There is constant employment for these private gangs in parts of Cumberland and Westmorland for nearly nine months of the year. The period during which I was occupied on my inquiries in these counties, namely, from the beginning of November until the middle of March, when there is an almost total suspension of outdoor field labour except ploughing, necessarily afforded me no opportunities of observing them at work, or of testing the state of education of the children employed in them; but I heard from persons on whom I can rely that they are chiefly composed of children of the lowest class, that they are not properly looked after while at work, and that their education is greatly neglected. The rate of payment for turnip thinning is 1*d.* per 100 yards, and a sharp boy or girl can thus often earn from 1*s.* 6*d.* to 2*s.* a day. The children employed in these private gangs have, in the vicinity of Cockermouth, to walk four or five miles out to their work, the only food brought by them consisting of a piece of dry bread; the farmers, however, occasionally send into the fields some milk as an addition to their scanty mid-day meal.

Require to be placed under regulations.

26. These private gangs require to be placed under regulations, and the separation of the sexes while at work enforced where the gang is large. This would subject the farmer to no material inconvenience, and if on leaving work they were conducted to their homes by some trustworthy servant it would be a wholesome check upon misconduct, which I have no doubt is much required.

Work on small farms often done by piece by a man and his family.

27. On small farms any work that is required to be done quickly is generally done by piece-work. A man contracts to single a certain quantity of turnips, for example, at a stated price per acre, and he does it by employing his wife and children, or he enters into a temporary partnership with a neighbour, and their united families do the work. The parents having their children under their eye no objection can be made to such an employment of the young.

Farm Servants and Agricultural Labourers.

Explanation of the general employment of farm servants. Origin of half-yearly hirings.

28. About two-thirds of the farm work of these counties is done by men and women who are hired by the half year, and boarded and lodged in the farmhouses. The arrangement is found to be attended with some advantages both to employers and employed. The practice of hiring by the half year originated in the desire of the farmers to prevent labourers from gaining a settlement by hiring for a year, and the practice has been continued partly from habit and partly from motives of convenience.

Scarcity of cottages.

29. A marked peculiarity in the economy of these counties is the paucity of cottages. This was not felt as an evil when almost all agricultural work was done by the small proprietors or small tenant farmers and their families, and where the subdivision of land was so general cottages were not built because they were not required. Employment for a day labourer moreover was too uncertain and precarious to encourage men from other districts to settle where they could not rely on regular wages, and the work of these counties was done almost exclusively by the native population. To a great extent this is still the case. There are no large agricultural villages from which regular supplies of day labour can be drawn. The farmhouses are generally isolated and remote from other habitations, and, if a farmer had not his labourers lodged under his own roof, he could not get the work of his farm done at all.

Farm servants necessary. Advantages of the system.

30. Farm servants who reside in the house live quite as well as their masters, and are thought to have their employer's interest more at heart than common labourers who are paid by the day. In the hay and corn harvests, for example, it is not unusual, if the weather should be unsettled or rain expected, for farm servants to work until very late at night, and even all night, and they never expect or require any extra payment for such overwork. They are always at hand to attend, early and late, to the horses and the stock, the master's eye is constantly upon them, and he often works as hard as themselves.

Farm servants a peculiar class.

31. Farm servants in these counties have always been a peculiar class. They are not like the agricultural labourers of some other parts of England, a well-defined portion of the community who marry without regard to consequences, and multiply beyond the requirements of the labour market. The mode of living and the objects in life of the farm servants of Cumberland and Westmorland discourage early marriages, and thus keep down the number of those who compete for wages, and prevent the supply of labour from ever exceeding the demand.

Geographical position not favourable for the immigration of labour.

32. The geographical position too of these counties, as will be seen by a glance at the map of England, is such that they are not favourably situated for the immigration of labour. They are bounded on three sides by great manufacturing districts. Westmorland is to only a very limited extent a manufacturing county; it has its bobbin mills in many a picturesque glen where water power is abundant, but it has only one town of manufacturing importance, namely Kendal, but Cumberland is a mineral county, and its mines employ a considerable number of men.

The census returns for both counties show a slow increase of population.

33. The population of both counties increases only at a slow rate. The census returns for 1861 for Westmorland indicate a considerable amount of emigration from that county. There were then living in England, but out of the county, 23,068 persons who had been born in Westmorland, and the whole population amounted only to but 60,810 souls.

Enclosure of commons has not much added to the population.

34. The increase of the population, compared with the area of the land brought within the present century into cultivation, has also been but small. The commons in Cumberland enclosed between the years 1793 and 1816, have been estimated at 200,000 acres, and since 1816 the enclosures have amounted to about 100,000 acres more. In Westmorland the proportion of modern enclosures to the area of the county has been about the same as in Cumberland.

Wages of farm servants.

35. The hiring of the farm servants male and female takes place half-yearly at Whitsuntide and Martinmas in the principal market towns. Their wages varying according to their age, strength,

* In some parts of Cumberland and Westmorland the hoe is exclusively used.

L.

and qualifications. A boy of 14 when he first enters service receives from 30*s.* to 50*s.* the first half year, and if he proves to be a smart lad and willing, he is very soon in the receipt of 6*l.* or 7*l.* for the half year; and when he can take charge of a pair of horses and hold his own in the harvest field he is entitled to and receives man's wages. Girls go to farm service when about 14 and receive from 30*s.* to 2*l.* the first half year, and as they become stronger and are able to take a more active part in the household or farm work their wages rise rapidly until they receive 5*l.* 10*s.* or 6*l.* for the half year. An able-bodied farm labourer before he rises to the position of "head man" obtains from 18*l.* to 20*l.* yearly, and a "topsman" has seldom less than 28*l.* or 30*l.* a year with food, washing, and lodging. The increase in the money rate of wages within the present century has been very great. According to Bailey and Culley the wages of men farm servants in 1805 were from 5*l.* to 7*l.* for the half year, and of women from 2*l.* to 3*l.*

Present mode of living of farm servants compared with the past.

36. The labourers who reside in the farm houses are abundantly fed. The improvement which has taken place within little more than half a century in the diet of the labouring classes of these counties is most remarkable. In 1795 Mr. Curwen, then member for Carlisle, to show the inability of the labouring population to bear any further taxation, entered the House of Commons dressed as a Cumberland labourer in a grey homespun coat, wearing the wooden clogs of the county rimmed with iron, carrying under one arm a brown "groudie" or loaf made of mixed barley and rye, and under the other a "whellimer" or skimmed milk cheese, and bearing in his hand a "gully" or large knife with which when he cut the black loaf and the cheese he had placed on the table, he produced a sound in the one resembling the crushing of cinders, and in the other that of planing a deal board.* Eden, in his History of the Poor Laws says, that about the year 1740 so small was the quantity of wheat consumed in the county of Cumberland that it was only a rich family that used a peck in the course of the year. The ordinary dietary of the Cumberland and Westmorland farm servants at the present day is, for breakfast porridge made with milk, at 10 a.m. a meal consisting of bread and cheese with in some districts beer or milk, which is taken out to the men at their work by one of the female farm servants; dinner consisting of fruit puddings according to the season, or if plain, with treacle sauce, and meat, either mutton or beef, baked, boiled, or made into pies, puddings, or stews, with potatoes and other vegetables. At four o'clock follows a light meal, consisting of bread and cheese, or tea and bread and butter, or sometimes gooseberry or apple cake, which is taken to the men at their work as in the morning. The supper is usually porridge as before, or milk, bread and cheese without stint. The bread is composed of two-thirds of the best wheaten flour, and one-third of rye, and which for sweetness and nourishing properties cannot be surpassed. Beer is rarely given except at harvest, tea is but little used.

Efficiency of farm servants.

37. Sustained by this ample and generous diet the Cumberland and Westmorland farm labourer is in the highest possible physical condition, and with his mind at ease as to the future, (for he is well able after providing for his clothes, and indulging in occasional recreation to put by at least two-thirds of his wages,) is not only an able but a willing labourer, and does his work honestly, thoroughly, and cheerfully.

No one who has entered a Cumberland or Westmorland farmhouse at the dinner hour and seen the servants seated at their long table could fail to have been impressed with the picture of rural comfort, abundance and health which the kitchen then presents. "Our people," said a large farmer to me on the occasion of one of such visits, "live quite as well as ourselves. There is no difference "in the quality or cooking of the food for my own family and my servants."

Independence of farm servants.

38. There is, however, another aspect in which this picture must be viewed. From the scarcity of labour and the demand for farm servants they are quite aware of their importance. "The men are "becoming our masters," said the land steward of one of the principal proprietors in Westmorland to me, "and if the present deficiency of labour should increase we shall speedily change positions "in this county."

Prevalence of immorality.

39. These counties have become notorious for the very large per-centage of illegitimacy as compared with others. The Registrar-General's reports reveal a state of society in that respect very much to be deplored. The farm servant system is credited with much of the evil. The men farm servants are as a rule unmarried, and as there are always one or two and sometimes three or four female farm servants living in the house the temptations to immorality are great; and girls who enter young into service fall easy victims to men who are not likely to impose much restraint upon their passions, and who have no other opportunities of gratifying them than the farmhouse affords. Unchastity, too, is not regarded in a very serious light by the class from which farm servants are taken. No disgrace, scarcely any discredit, attaches to a girl who has had one illegitimate child, which is generally denominated a chance child, the event being merely spoken of as a misfortune.

It cannot, I think, be doubted by any one who has investigated the subject, and heard the opinions of persons in the district competent to form an opinion, that a vast amount of immorality takes place in the farmhouses. "I firmly believe," writes the Rev. Thomas Goss, the rector of Stapleton, Cumberland, "that the living together of male and female servants under very little proper supervision or "restraint is productive of far more evil than is generally supposed. I believe there is more immo-"rality in the farmhouses of this county than in the poorest cottages." I heard of young female servants having had as many as three, four, and even five illegitimate children by different men, but the notorious fact did not in any way affect their prospects of future employment. The children are either put out to nurse or taken care of by the mothers' relations.

Farm servant system discourages marriages.

40. It is one of the disadvantages of the farm servant system in these counties that it acts as a discouragement to marriage. In some parts of England this might not be considered as an evil, but in one where the population is already insufficient for its industrial requirements any arrangement which keeps the labour market permanently under supplied cannot but be regarded as unsatisfactory. A farm servant when he marries loses his situation and becomes a day labourer. The disinclination to marry under these circumstances is natural. He is abundantly fed, need take no

* See Lonsdale's Life of John Christian Curwen, M.P.

L.

thought for the morrow, and if he aspires, as many of his class do, to become a farmer himself, or possibly even a small proprietor, he must relinquish, if he marries young, all his cherished hopes and objects in life. Whether these objects are the most desirable for that class of the community I shall have an opportunity of considering in the sequel of this report.

Hiring fairs.

41. Farm servants are hired at the statute or hiring fairs. This system is generally condemned as one of the great incentives to immorality. Attempts to abolish it have been occasionally made, but they have not been seconded either by the farmers or the men. An employer likes to see those upon whose industry the success of his farming mainly depends, to form an opinion on their capabilities for work, and to learn something of their antecedents. He can accomplish all these objects at once at the hiring fair, for the place is full of farmers assembled for the same purpose as himself. The farmers are less particular than they ought to be as to the moral character both of the women and of the men whom they hire; but the men are very inquisitive indeed as to the character of the farmers. If an employer has once acquired the repute of being ill-tempered, rough in his manners, and above all illiberal in his table, he may seek in vain for a labourer such as it is his interest to engage; he may tempt him with the offer of high wages, and perhaps promise an additional meal, but he will turn a deaf ear to all his advances, and the master will have to put up with the refuse of the market, and possibly find after a few days' experience that he had got a servant whom it would be almost better to be without. "I will inquire into your character," said a farmer to a man who offered himself for hire, "and you "shall know my decision in the afternoon." At the appointed hour the man re-appeared, and addressing the farmer who desired to engage him, said, "Since I saw you this morning I have got *your* "character, and *my* decision is to have nothing to do with you."*

Hiring fairs not attended with the same abuses as formerly.

42. The hiring fairs, I was informed, are conducted with more propriety than they formerly were. The towns are earlier emptied of their visitors, the railways conveying them in the direction of their homes. The public-houses have not so much custom as they had; and there are fewer inducements to squander in a week the wages of a half year.

Proportion of servants to a farm.

43. The number of men hired for a farmhouse generally depends upon the number of "draughts" employed upon the farm, one man being considered enough for each pair of horses, with a boy or two in addition according to circumstances. For any additional labour the farmer employs day men, if he can get them at 1*s.* 3*d.* or 1*s.* 6*d.* per day, with food, but, as a general rule, the employer prefers giving a labourer 1*s.* 6*d.* a day, with meat, to allowing him 2*s.* 6*d.* without meat; and, so far as the value of the labour is concerned, he is right; less time is lost, and a well-fed labourer is much better able to do his work than one who is perhaps compelled to pinch himself for the sake of his family. Instances were mentioned to me of day labourers breaking down under work that a well-fed farm servant would accomplish with ease.

Wages of day labourers.

44. The wages of agricultural day labourers, when they provide for themselves, vary from 15*s.* to 18*s.* and 1*l.* 1*s.* per week. To these high wages are frequently added privileges worth from 4*l.* to 5*l.* a year. In some places cottages are allowed rent free; in others a labourer is permitted to plant potatoes in his employer's land, the labourer finding the manure, which is carted to the field for him free of expense. To these must be added the additional wages paid in haytime and harvest. In haytime as much as 5*l.* a month is sometimes given with board and lodging, but the usual wages in those seasons are 3*l.* 10*s.* or 4*l.* a month.

Cause of high wages in Cumberland and Westmorland.

45. One reason why day labourers are paid higher wages in these counties than in most others is that they are not very generally employed. The principal work on small farms is done by the resident farm servants and by the farmer's family, and the farmer obtains his labour upon the whole of a better quality when he boards and lodges his men than when he hires labourers by the day. In the comparative cost of farm servants and day labourers I heard different opinions expressed, but much of the food consumed in the house is the produce of the farm, and as the men live better than day labourers, are always at hand and less particular as to hours, they not only do more and better work in a given time, but work longer and harder. On many farms the farmers' sons and the farmer himself work with the men, who cannot object to labour which the master's family share with themselves.

Comparative cost of farm servants and day labourers.

46. Taking the keep of a farm servant as costing 9*s.* a week, which with the present price of butcher's meat is not too high, the expense of boarding a man for a year would be 15*l.* 12*s.*; add to this his money wages of 20*l.* and the total charge will amount to about 14*s.* 6*d.* per week. But although the cost to the employer will not exceed this sum the advantage to the employed is very great. He could not buy and cook food of the quality and quantity which he obtains in a farmhouse and pay the rent of a cottage for anything like 14*s.* 6*d.* per week, and the health and strength which an ample and nutritious diet secures are beyond calculation and price.

Evils of the farm servant system.

47. Against these advantages are to be set the isolation of farm service, and the celibacy which is one of its conditions. The servants residing in farmhouses have little to vary the monotony of their daily life. Most of the homesteads being far from villages or towns farm labourers have little intercourse with the world; a reading room or public library is seldom within their reach, a provincial newspaper which they read or hear read is the only resource for the Sunday, their mental vision is necessarily very bounded, and it is not surprising that animal gratifications should possess irresistible attractions when there is nothing to supply their place. That farmers might do much more than they are in the practice of doing to elevate the intellectual and moral character of their men there can be no doubt, but I am glad to have it in my power to state that I met with many instances in which farmers took considerable pains to provide recreation and amusement for their men after the hours of work.

The "terms" of farm servants.

48. There are two periods of the year, however, in which farm servants, male and female, fully indemnify themselves for the seclusion in which they pass the greater part of their lives. For a week at Whitsuntide and Martinmas, when the half-yearly hirings take place, there is an almost total suspension of agricultural labour throughout these counties. These periods are designated "terms." The hirings being invariably only for six months, the stipulated period of service being at an end, there must either be

* This incident was mentioned to me by Rev. J. S. Hodgson, Rector of Aikton.

a renewal of the engagement or another place must be sought. As a rule farm servants seldom remain more than six months in one place, however good may be the situation; they generally seek a change of masters. The brief interval between the leaving an old and entering upon a new place is a general holiday. Some visit their relations, or make excursions to towns; others who are saving money and hope to become small farmers embrace the opportunity of visiting neighbouring farms that may have acquired a reputation for good management; the greater number give themselves up to such enjoyments as are to their taste and are too often drawn into a vortex of dissipation. L.

Amusements of farm servants. Passion for dancing and love of dress.

49. The Cumberland and Westmorland farm servants are naturally a pleasure loving class. All the arts of the innkeepers are employed on these occasions to induce them to spend the wages they have just received. Prizes for wrestling, racing, leaping, shooting at a mark, &c. are among the attractions held out to draw them to the vicinity of the public house; but the most powerful is the "ball" in the evening, without which no entertainment would be considered complete. The "accomplishment" of dancing is universal. A day labourer with a large family may declare that he is too poor to pay the weekly pence for his children's schooling, but he seldom fails to find money enough to pay for the lessons of the itinerant dancing master. A passion for dress among the women is universal, and no inconsiderable part of the wages of a farm servant girl is expended on her person. At church it would be difficult to distinguish a farm servant from the daughter of a statesman or of a substantial tenant farmer, and a girl whose ordinary costume is a coarse petticoat, pinned close round her body, and wooden clogs, will appear at a dance in a white muslin dress, white kid boots and gloves, and with a wreath of artificial flowers on her head.

Savings of farm servants.

50. Farm servants are most favourably circumstanced for making a provision for themselves in after life, but the temptations to spend money have so much increased that they are, I was informed, less provident than they were when wages were comparatively low. Many, however, avail themselves of their opportunities of saving money, and in a few years accumulate a little fortune. By the courtesy of the managers of the Morland Branch of the Carlisle Savings' Bank I obtained a list of the existing deposits by farm servants of sums over 100*l.* in that district, which may be taken as examples of the savings which that class can effect if they please:—

Males.

	£	s.	d.		£	s.	d.
T. R.	148	8	7	R. B.	152	9	0
J. G.	172	6	6	T. R.	110	4	3
M. L.	182	13	6	J. W.	120	10	8
J. R.	132	11	10	J. G.	133	6	10
T. B.	171	1	2	J. E.	118	18	11
J. H.	136	7	11	J. S.	109	8	11
J. B.	162	9	10	J. K.	100	2	4
J. J.	100	0	2				

Females.

	£	s.	d.		£	s.	d.
S. H.	106	15	10	G. H.	163	1	0
R. P.	180	0	0	A. P.	189	4	2
F. N.	149	19	1	A. T.	107	7	0

These lists, however, by no means represent the full amount which farm servants of prudent habits have the power of accumulating for establishing themselves in life, or as a provision for old age. There are instances of sums of 500*l.* having been saved, and a case was mentioned to me of a man, still young, who commenced saving by depositing when a boy 10*s.* in the savings' bank, and whose account now shows 400*l.* to his credit.

Return of the Carlisle Savings Bank.

51. By the last annual report of the Penrith Branch of the Carlisle Savings' Bank it appears that the total amount due to 260 male farm servants is 9,259*l.* 9*s.* 5*d.*, to 240 female farm servants 7,904*l.* 8*s.* 9*d.*, and I was informed by the ex-manager and secretary of this bank that according to his experience farm servants are in the habit of depositing 10*l.* or 15*l.* a year.

Other modes of investing savings.

52. In some places private banks receive deposits from servants of small sums saved out of their wages, but there are many who do not use a bank of any kind, or if they do they withdraw their money after it has reached a certain sum, and lend it to some person who is willing to pay higher interest. Farm servants also often leave their wages in the hands of their masters, receiving interest, and they occasionally trade or speculate a little on their own account.

Benefit societies partially used by farm servants.

53. Farm servants being hired by the half year their employers are bound to maintain them and take care of them during illness; but sickness among this class is rare, their excellent diet and regular hours keeping them in excellent health; nevertheless, there is among the list of subscribers to benefit societies of these counties a fair proportion of farm servants. The annual club procession and the subsequent social meeting act as inducements to young men to join these societies, and when they have once become members they continue to pay their subscriptions, although they rarely derive any benefit from their membership unless they marry and become day labourers.

Returns of farm servants subscribing to benefit societies.

54. The numbers of farm servants on the books of the under-mentioned lodges represent pretty correctly the proportion in which they may be supposed to join these societies:—

The "Statesmen" or Yeomen of Cumberland and Westmorland.

Origin of the statesmen.

55. There is a class of small proprietors known in these counties from time immemorial under the denomination of statesmen or estatesmen. The subdivision of landed property, which gave rise to this order of men, originated in two causes.

1. In encroachments upon the rights of lords of manors in a district which from its remoteness from the more advanced districts of England was little valued, and regarded as scarcely worth the trouble and cost of supervision,thus affording facilities for irregular appropriations of the wastes.

2. In the policy which prevailed during the Border wars of enfranchising villeins and of creating a number of small customary tenants bound to military service on an extensive scale for the purposes of providing an adequate force for the defence of the country.

This system of the subdivision of the land ceased after the union of the two crowns, but it had then proceeded to such an extent as to give to these two northern counties the peculiar character of a community of small proprietors farming their own estates. Up to end of the last century, the great majority of farmers in these counties were the owners of the land they tilled.

Statesmen still numerous.

56. Proprietors of estates varying from 20 to 150 or 200 acres are denominated statesmen, and they still, although greatly reduced in numbers, possess a very marked influence upon the social features of these counties. I have been unable to obtain even an approximation to the existing number of such proprietors, but there can be no doubt that, greatly as they have diminished within the present century, they still own no inconsiderable portion of the land of both counties. They exist in their primitive simplicity only in the mountain dales, where the whole of the work required on the small estate is generally done by the proprietor and his family. There is scarcely any portion of these counties in which the properties of "statesmen" are not still found intermixed with the lands of the more considerable proprietors.

Causes of their decline.

57. Many causes have contributed to bring about their gradual decline. Railways and free trade introduced new ideas and new principles into this district for which these primitive holders of the soil were unprepared, but the process of extinction had commenced at a much earlier period. Pringle in his General View of the Agriculture of Westmorland, published in 1805, attributes their steady decrease to the turnpike roads, which he says had brought the manners of the capital to the extremity of the kingdom, destroyed the simplicity of ancient times, and caused finer clothes, better dwellings, and more expensive viands to be sought after by all. The small estates, he adds, were being everywhere sold, and many a statesman had been reduced to the necessity of working as a labourer on those fields which he and his ancestors had for many generations cultivated as their own. The diminution in the number of small estates has certainly been continuous for more than a century, and those which remain are generally heavily burthened with debts. Children have to be maintained out of the estate after the owner's death, and the land is frequently charged with portions larger than its value can bear, and after struggling in

* Includes railway labourers.

vain with accumulated difficulties, the inheritor of a small estate is at last obliged to sell, or if he succeeds in retaining the patrimonial property and in transmitting it to his heir he leaves him only to continue the same unceasing conflict between industry and want, in which his predecessor, and a long line of predecessors before him, lived and died.

The increased competition for land, and the generally high price which it commands, has operated in the same direction, and many small proprietors have been tempted to part with their paternal property and to seek their fortune in emigration.

Small estates cultivated by the proprietors and their families.

58. The owners of small estates generally farm their own land with no help but that of their children, but on estates, of from 80 to 150 acres farm servants are generally hired, and the children are educated to fit them for some business or profession.

It is astonishing upon what small means these petty proprietors were formerly able to bring up their families.

Twenty acres were once considered enough for a statesman's subsistence; one supplied oatmeal sufficient for the consumption of a small family for a year, from half an acre were obtained potatoes enough for the family and the pigs, a couple of cows produced butter and milk chiefly for sale, the female calves were reared, the bull calves sold, a sheep or two and a pig salted down provided sufficient animal food for a year, and the wool of the sheep was either spun and converted into coarse garments or sold to supply the family with clothes.

Bad farming of the small statesmen.

59. Excepting on the land of some of the larger proprietors, the farming of the statesmen is generally bad. There is little spirit of improvement in the class. If they possess a little money they prefer hoarding it in their oaken chests to laying it out on the land. "Would you not," was inquired of an old statesman, "expend a shilling on your property if it would eventually return you five shillings?" "No; "I would rather button it up in my breeches pocket; it would be safer there," was the reply. The roads leading to their homesteads are generally so bad that it has been said that the only safe mode of reaching them would be by a balloon. The midden or dung pile is close to the door of the dwelling house. The land, generally undrained, is prolific of rushes, and the whole appearance of the property denotes poverty, slovenliness, and neglect. Bailey and Culley when they visited Cumberland, early in the present century, were struck with the impoverished condition of the small statesmen, and the condemnation then pronounced on their management I have seen nothing to induce me to consider as inapplicable to the present day; "These men" they say "seem to inherit with the estates of their ancestors their "notions of cultivating them, and are almost as much attached to the one as to the other."

Small statesmen often unable to make a living from their property.

60. I heard of several of the smaller statesmen who finding it impossible with their limited capital to make a living out of their land, sold it and became tenants of the very farm which as owners they had vainly endeavoured to cultivate with profit. In one case a small statesman who had become embarrassed sold his property to a neighbour, who took the estate into his own hands and employed the former proprietor as his hind; and in a very short time the land under improved management was made to yield double its former produce. At best these small proprietors have to struggle hard for a subsistence, and small statesmen of from 50*l.* to 70*l.* a year are obliged to work harder and longer than any labourer would consent to do for the highest wages that could be offered him.

Bad effect of small estates on the education of the children of their proprietors.

61. The effect of these small properties on the children of their owners is not favourable, for they are often kept from school for months to assist in the work of the farm. On inquiring of one at what age his children began to assist in farm work, "as soon as they can crawl," was the reply; and I believe I am correct in stating that as a rule the children of the smaller proprietors feel the disadvantages of a neglected education through life, and do not prosper in the world so well as those of agricultural labourers.

Economically considered prejudicial to the public interests.

62. If it is important that the soil should be cultivated with the maximum effect the small statesmen of these counties certainly do not satisfy that desideratum; half shepherds, half husbandmen, they are deficient in the spirit and enterprise which agriculture requires, and they are without either capital or skill. In the districts where tillage prevails they are singularly out of place. In small sheep and dairy farms they have a more legitimate occupation, and they will probably linger long in the secluded mountain dales, a remnant of that community of small proprietors whose simple manners and sturdy independence have long given to this part of England one of its most marked characteristics.

The Small Farmers of Cumberland and Westmorland.

Predominance of small farms.

63. I have already adverted to the predominance of small farms, as well as of small estates in these counties. Bailey and Culley state that the generality of farms in Cumberland were from 15*l.* to 30*l.* per annum, and that some few extended to 100*l.* The number of small farms has considerably diminished since Bailey and Culley wrote, although they are still very numerous, and I was informed by a land agent of long experience that a third of the existing tenant farmers were once farm servants. The number of small farms is greater in Westmorland than in Cumberland in consequence of the great preponderance of pasture over arable land. The production of butter forms a very profitable department of farming, and the produce of some of the dales, noted for the sweetness of their herbage, is in much request in the manufacturing towns of Lancashire and Yorkshire.

Dairy and sheep farms generally best adapted for small capitalists.

64. Rearing poultry has also recently become from the same reason an object of some importance to small farmers. It is not uncommon for a farmer's wife with her cartload of poultry, butter, and eggs, to be stopped on her way to market by a middleman from Manchester or some other manufacturing town, and the whole contents purchased by the roadside.

Small dairy farms, with which the rearing of sheep and poultry can be combined, seem best adapted for persons of small capital, such as retired farm servants. On some sheep farms little or no capital is required to begin with, the flocks being often the property of the landlord. On entering upon such a farm viewers are appointed on each side who report on the numbers and quality of the stock and fix the value of each per head. The incoming tenant gives a bond for the amount, and is required to deliver an equal number of the same value at the end of his tenancy; in other cases the stock is bought by the tenant who disposes of them to his successor on a similar valuation. A right of common of pasture is generally appurtenant to the tenement, limited by the number of animals *levant and couchant*

L.

on the enclosed land of the farm. Each flock has its distinguishing marks of ownership, which is registered in a book particularizing every sheep owner in Westmorland and Cumberland, and a meeting is held annually at some appointed place for the exchange of sheep which have gone astray and become intermixed with other flocks.

Number of small farms diminishing.

65. The number of small farms is rapidly diminishing in both counties, and it is not to be expected that this mode of investing their savings will be much longer open to farm servants. The consolidation of farms is becoming general as it is found by the landed proprietors to be most beneficial to their interests.

Successful conversion of small into large on Sir Frederick Graham's estate.

66. The success with which it has been carried out on the estate of Netherby under the direction of the late Sir James Graham and his able land steward Mr. Brown, affords a striking illustration of the soundness of this system. In 1835 the Netherby estate was occupied by 315 tenants; the number is now reduced to 115 with an increase of upwards of 30 per cent. to the rental.* I was favoured with the following statement by Mr. Brown of the mode in which the improvement was carried out, and its results:

"When the late Sir James Graham succeeded to the estate in the year 1819 it was in a most ruinous condition. The good land which had been exhausted by repeated corn crops was chiefly divided into small farms of from 40 to 100 acres in extent. The estate was overburdened with an excessive population; a great portion of it remained unenclosed; the farm buildings, with few exceptions, were very bad, being chiefly formed of clay or mud walls, and thatched, whilst three-fourths of the estate was completely saturated with water, and a great excess of moss and cold pasture land on that account alone remained uncultivated. The public roads were also in a most wretched state and quite insufficient for the purposes of occupation.

"The first step towards the improvement of the estate was the amalgamation of many of the small possessions into suitably sized farms of from 100 to 500 acres in extent, the erection of good and substantial farm buildings; the division of the land into proper enclosures by quick fences; making proper occupation roads where necessary; granting 19 years' leases to the tenantry with improving clauses inserted therein, binding them to follow out the most approved system of modern husbandry; and lastly, establishing two tile kilns upon the estate, to furnish tiles for the use of the tenantry.

"By these means under able and skilful direction, and with the cordial co-operation and support of a most industrious and persevering body of tenantry, the estate has been brought into its present high state of cultivation, whilst hardly an acre capable of improvement remains unbroken up."

Mr. Brown adds, that after 27 years' experience he had come to the conclusion that when you can command eligible tenants, possessed of the requisite capital and skill, good land is best and most economically managed in large farms of from 500*l.* to 1,000*l.* per year; on inferior soils, where labour and industry constitute a great portion of the capital employed, farms of from 80 to 100 acres, but not smaller, are admissible and sometimes found to be advantageous and desirable, and that such farms are generally carefully and fairly managed, and are also the means of rearing an industrious body of tenantry, who often become occupiers of larger and better farms. Scarcely any of the tenants on the Netherby estate occupy less than 80 acres at a rent of 50*l.* a year. In an economical point of view the system has been attended with the most beneficial result. There is no waste of labour, while the tenants have been raised from poverty to comparative comfort and prosperity, and the productive power of the soil has been greatly increased by improved cultivation. Mr. Brown further adds, that he considers a man and his family occupying from 20 to 50 acres of poor land, even at a small rent, is far worse off than an agricultural labourer or husbandman employed on a good sized farm.

Hard life of small farmers and their bad husbandry.

67. It is obvious by what very small error in judgment a small capital may be impaired, rendered unproductive, or totally lost; and certainly nothing can be more wretched than the average farming of a man who, from a labourer, with the aid of his own and a little borrowed capital, has become a farmer on his own account. He buys a plough, a team of horses, and a few implements; he reaps his first crop of stunted oats, and when its straw has been converted by a few calves and half-starved yearlings into what can scarcely be called manure, he carts it out into his fields after it has been drenched by the winter rains, and is disheartened at the miserable results. To enable him to pay his rent he is generally obliged to part with his grain, whatever may be its price, and his stock before it has attained its maximum value; and before the first two years of his tenancy have expired he has too often cause to regret the day on which he was tempted to exchange the safe position of a comfortable farm servant for the anxieties and hardships of a tenant farmer.

Alleged advantages of small farms.

68. There are perhaps a few advantages attending small farms which should not be entirely overlooked. More attention is bestowed on the production of butter, eggs, poultry, honey, and other useful commodities which a large farmer usually deems beneath his notice, and which if the whole area of the country was thrown into large farms would scarcely be produced at all, or if produced would be solely for the consumption of the occupier and his family.

Small farm system gradually diminishing.

69. Farm servants, however, are not so much disposed to lay by their money for stocking a farm as they formerly were. Some marry early and settle down as labourers. A letter which I had the honour to receive from the Rev. R. C. Pattenson, rector of Melmerby, a gentleman thoroughly acquainted with the social state of Cumberland, places this matter in a very striking point of view. He writes:—

"I generally on a Sunday have some of my people to dinner. On Sunday last I had two tenants on this estate; both were originally farm servants. A. is 70 years old and now occupies a farm at rent of 370*l.*; B. is 50 and holds a farm of 150*l.* per annum. A., the elder, lived 25 years under three masters, and B., the younger, 20 years under two masters. I read your questions to them, and they considered that they could not now have taken farms upon their savings. Far more capital is now required to stock a farm than when they began, labour is so much more expensive. To take an instance; a few weeks since a farmer wanted some barley thrashed, and although he offered 2*s.* a bushel, he could not obtain a man at the price; 30 years ago 6*d.* was the rate,† but then thrashing machines were rare. I can remember when five only were in this whole district; now we have six in this small parish alone. But not only is more capital required to stock a fame but small farms are let at extravagant rents, and in the end (and I have seen many failures) become simply nests for poverty, or sinks of the capital laid out upon them. The condition of a day labourer is far better

* There was, however, at first, a considerable outlay in enlarging the fences and in draining.

† Bailey and Culley (1805) state the price of thrashing a bushel of barley as 2*d.*

than that of a small farmer with little capital. The day of small farms is over. They will die a lingering death, but their day is over. Even in the "dales" they are only "grass" farms. Their days are told, and I think their death is for the benefit of the nation. I don't think the number of petty landowners is decreasing so rapidly as that of small farmers, but as the purchase value of land increases, they too must die out. It is astonishing what sums these men will give or borrow for land. It is almost their only idea of investing their money; no wonder that so many small statesmen are poor; poorer than small farmers, more *pinched* than their labourers." L.

70. The boon ploughing day is one of the remarkable institutions of this district. Whenever a tenant enters upon a farm it is expected that all his neighbours within a certain distance shall bring a pair of horses and a plough on a fixed day and give him a day's ploughing. Nothing can more clearly show the primitive poverty of this county and the difficulty of obtaining labour than this custom. Although confined at first to the small farmers it has gradually extended, until it is recognized by the largest. It is a day of festivity; and a farmer is regarded as having failed in the duty of hospitality if he permits any visitor after the day's work is over to leave the homestead sober. Seventy ploughs have been seen simultaneously at work on a large farm, and it is not unusual for 50 acres to be turned over in the course of a day. Boon ploughing day.

71. The education of the small farmers is on the whole better than that of the small statesmen, one of whom, I was told, can only distinguish the notes of one country bank from another by closely scrutinising the insignia or symbols by which they are adorned. State of education of the small farmers.

72. Neither Cumberland nor Westmorland possesses a chamber of agriculture, but there are three farmers' clubs in which papers are read and discussions taken on them. Some of the superior statesmen and tenant farmers are by no means behind the age, and they are prompt to adopt the latest agricultural improvements, a knowledge of which they acquire by reading the principal publications of the day and by attending agricultural shows. Farmers' clubs.

73. I am indebted to Vice-Admiral Russell Eliott, of Appleby Castle, agent for the extensive property of Sir Richard Tufton, Bart., and the occupier of a large mixed farm in the fertile valley of the Eden, for the following details of the cost of labour per acre on one of the most important in the district, and which may be considered as a representative farm. It is managed on the Scotch system the labourers living in cottages, providing their own meals, and being paid weekly wages. The valley of the Eden contains some of the best land in the county of Westmorland and is about the same average fertility as the highest rented land in Cumberland. Rate of wages paid on a large farm in the valley of the Eden.

It will be seen from the note below * that the labourers are paid 12*s.* a week throughout the year. Two cartloads of potatoes are grown for them from seed supplied by themselves, and coals are led for them to their cottages. Some addition is made to their wages during the hay and corn harvests.

74. Nothing, however, conduces more to their comfort than a cow, for the keep of which Admiral Eliott deducts from their wages 2*s.* a week. Estimating the profit of a cow for a year at 10*l.*, with butter at 1*s.* 6*d.* per lb., the labourer obtains a clear money gain of 4*l.* 10*s.* besides having an ample supply of skimmed milk for the use of himself and his family. It is impossible to over estimate the value of this arrangement on behalf of the working man, for the difficulty in obtaining a sufficient supply of milk is great. Even labourers residing in or near villages are often unable to procure it. Farmers decline to sell it finding it more valuable when consumed by their pigs and young stock, and they are perhaps unwilling to encourage the visits to the homestead of people who have no business on the farm. Advantages of a cow kept for labourers.

75. Admiral Eliott's farm bailiff's schedule of wages paid within a year will be found in the appendix to this report. It appears that the total cost in wages for a year on the Langton Field farm amounts in round numbers to 700*l.* which upon the average of 1,220 acres, 650 acres being arable and 562 permanent pasture, amounts to 11*s.* 6*d.* per acre, or thereabouts. I should add that Admiral Eliott estimates the value of the horse labour employed on his farm at 280*l.* a year, and no doubt horses since machinery has been introduced do much work, especially in cutting hay and corn, that would otherwise be done by human labour. Cost of labour per acre on a farm in Westmorland.

Farmhouses and Cottages.

76. Bailey and Culley in their survey of Cumberland, say that throughout the greater part of that county the farmhouses are remarkably well built of stone. The observation was only partially true at the time, for many were built of mud and clay. Construction of ancient farmhouses.

---

* List of persons employed by Vice-Admiral Russell Eliott at Langton Field Farm, in the parish of St. Michael, Bongate:

John Kerr	Farm bailiff	80*l.* per annum. Free house, garden, cow kept, and land for planting some potatoes.
John Swanstone	Foreman ploughman	50*l.* per annum. Free cottage, garden, and land for planting some potatoes.
John Tuer and John Currah	Ploughman	Each 12*s.* per week. Free cottage, garden, one cow kept, and land for planting some potatoes.
Thomas Sanderson	Attending to young stock	Ditto ditto.
John and William Sanderson	Ditto assisting	10*s.* 6*d.* and 7*s.* 6*d.* each.
Edward and William Tuer	Labourers	The former 12*s.* a week. Free cottage, garden, and one cow kept. The latter 9*s.* a week.
William and Thomas Nelson	Light work	Each 5*s.* per week.
Five women	Attending thrashing mill, pulling and hoeing turnips, &c.	Each 6*s.* per week.
William Hogg	Shepherd	In lieu of a money wage the shepherd has the following:—60 imperial bush. of oats, 18 bush. of barley, 6 bush. of peas, 1,200 yards of potatoes planted, coals driven from railway station, 12 half-bred ewes and 3 hogs, and one cow kept.
John Rae	Assistant shepherd	20*l.* per annum, and his board and lodging paid.

Note.—The above are the ordinary labourers employed. In hay and harvest time extra hands are employed at enhanced wages, and at this time the wages of the regular workers also are raised.

L.

In those parts of the county where stone suitable for building was scarce "clay daubies" roofed with thatch made of straw, rushes, or heather formed the dwelling houses on every farm. The fire places were on the ground, and extended nearly from one end of the building to the other. The chimneys were yawning chasms through which the sky might be seen, and which the rain freely entered. They were the curing place for hams, and across them ran an oaken beam from which the pot crook was suspended. Some examples of such buildings still remain, and during the Border wars no landed proprietor would think of expending more than was absolutely necessary upon houses that were any day liable to be burnt over their occupants heads; they were accordingly constructed of the cheapest materials. When the Border wars ceased, these counties were infested for more than a century by moss troopers, and to protect them from such marauders, farm houses were built in the form of a quadrangle, with a fold or yard to secure the cattle, the entrance being generally protected by an arched gateway with knobbed oaken doors, while the dwelling house fronted the yard. Some of these domestic fortresses still remain in the northern parts of Cumberland, and they are obviously well adapted for the purposes for which they were built.

The larger farmhouses generally well built, but the smaller defective in sleeping accommodation and in proper conveniences.

77. Most of the modern farmhouses are well built, every convenience having been studied in their arrangement, but the houses on the smaller farms are generally very bad and deficient in proper sleeping accommodation for the farmer's family and his servants. The rooms on the basement are generally flagged, but a parlour may now and then be seen with a boarded floor. The farmers seem to have been more desirous to possess good farm buildings, than good residences, and it is a very common thing to see byres and stables of imposing proportions attached to a very moderate dwelling house.

Many of the smaller farmhouses have no "conveniences," but some have a small detached building consisting of two stories, the basement being the pig sty, the first floor a "convenience," and the one above it a hen-roost, all communicating with each other.

Insufficient sleeping accommodation one cause of immorality in farmhouses.

78. The sleeping accommodation in the farmhouses has long been a disgrace to these counties, and although some improvement has taken place in this respect within the last 20 years, the same stairs often lead to the rooms of both the male and female servants. Only a few years ago in one of the largest farmhouses of the district, belonging to one of its principal landed proprietors, the men and women servants slept in the same room, the men at one end and the women at the other, with not even a curtain to separate them, and in another case a farmer, apologising for the domestic arrangements of his house, said he had done the best he could for the protection of his female servants by putting curtains to their beds.

Question of cottage accommodation not so important in these counties as in some others.

79. From the prevailing custom of lodging and boarding farm labourers in the farmhouses, and the great proportion which that class bears to other labourers in agriculture, the question of cottage accommodation, though a very grave one, does not assume that special importance in Cumberland and Westmorland which it possesses in some other counties. I have however to state as the general result of my observations and inquiries, that the cottage accommodation for the portion of the population which requires it is miserably defective, as the replies returned to the question bearing on that subject in the circulars which I distributed abundantly prove.

Cottages generally bad.

80. In a great many parishes the cottages are represented as deficient, either in the proper number of rooms, or in proper accommodation, or badly ventilated, and sometimes all these evils are combined. There is something peculiarly unattractive too in the exterior of most of the Cumberland and Westmorland cottages. They have a bald, cold, and repulsive appearance. The front door generally opens upon the road, without the intervention of any garden; no climbing rose, clematis, or honey-suckle twines round the porch or covers the bare, grey walls, presenting in that respect a disagreeable contrast to the cottages in some other parts of England, where the care bestowed upon the cultivation of a few flowers and in the exterior adornment of a hovel almost atones for the deficiencies too frequently to be found within.

Many of the larger farmers dislike the system of boarding and lodging farm servants in their houses, and would prefer hiring them by the day, and that they should provide for themselves, but the difficulties in the way of any general change are, from the want of cottages, at present insurmountable, and without more accommodation for day labourers, there can be no increase of the agricultural population. In the villages the cottages are generally bad, many have only two sleeping rooms, and some only one. In 18 parishes of Cumberland, the cottages in the returns are described as more or less deficient in proper sanitary arrangements, with little attention paid to ventilation, often without the accommodation required for a decent family. From Westmorland the reports are equally unfavourable. Many are described as overcrowded, badly supplied both with air and water, and with only two bedrooms. The cottages like the farmhouses are generally very imperfectly ventilated, one small pane of glass, six inches square, often affording the only supply of air; in some there is only one sleeping apartment for the whole family. With few exceptions all the cottages that I entered were defective in one or more of the requisites for comfort and respectability.

Cottage improvement the question of the day.

81. Cottage improvement was often impressed upon me by the clergy as the question of the day, for "how," they justly reasoned, "can we influence a class by schools when the houses they live in are "overcrowded, dirty, and often without the requisites of decency and comfort." The adoption of the Local Government Act has done much to improve the condition of labourers dwelling in towns, and it is to be hoped that the Labourers Dwellings Act may be found capable of being applied to the country districts.

Instances of cottage improvement.

82. In some places I found the acknowledged evil was being met by the exertions of landed proprietors. On the extensive estates of the Earl of Lonsdale efforts are being made to increase the number and improve the accommodation of labourers' dwellings. Mr. P. H. Howard of Greystoke Castle, who has long been convinced of the necessity of improvements in this direction, has built a considerable number of excellent cottages. Mr. George Moore, an extensive Cumberland proprietor, by offering prizes for the best kept cottages, has done much to raise the character of the population in his neighbourhood. Lord Kenlis of Underley Park, Westmorland, builds five or six new and improved cottages on his estates every year, and every married labourer on his property will eventually be provided with a cottage containing a sitting room, three bedrooms, a pantry, and a small back courtyard. The rent charged for such a cottage is only 2*l.* 10*s.* a year. The Earl of Carlisle has also recently built some excellent cottages on his estate at Naworth in Cumberland. The paucity of great landed

proprietors, together with the present subdivision of landed property in these counties, affords but little hope that the question of labourers' cottages will be effectually dealt with until the aggregation of estates has made much further progress and the existing anomalous relation between the agricultural labourer and his employer, referred to in ss. 38–40, gradually disappears under the influence of progressive civilization.

Gardens and Allotments.

Gardens attached to cottages too small.

83. Although many cottages in these counties possess gardens they are too small to add appreciably to the resources of the agricultural labourer, and they are little valued except in a few places where flower and vegetable shows have given a stimulus to their cultivation. To grow potatoes seems to be the only purpose to which cottagers apply any little ground that is attached to their dwellings, other vegetables being rarely seen in a labourer's garden. "In my own case," says Mr. Thomas Ainsworth, a gentleman conspicuous for his efforts to improve the condition of the labouring class in Cumberland and to promote education, "I was obliged to take away the gardens from "those houses which had them, as they were rarely cultivated, and where not cultivated became "receptacles for filth or waste places for children to make puddles in."

High wages the reason why gardens are not generally valued by the labouring class.

84. The high rate of wages partially accounts for this indifference to gardens, and as a rule a well-paid agricultural labourer prefers buying the few vegetables that he needs to raising them himself. On some farms day labourers are granted the use of a portion of land sufficient to grow potatoes for a year's consumption, the labourer usually supplying the manure while the employer carts it to the land. By this arrangement the labourer is able to feed a pig from which he is generally able to make a profit of 4*l.* or 5*l.* The general indifference to the advantages and pleasures of a garden yields, however, to the influence of societies for encouraging garden cultivation, and there are several which have kindled a spirit of emulation among cottagers, some of whom compete successfully with the best horticulturists in the district.

The allotment system but little applicable to these counties.

85. The allotment system to which so much importance is justly attached is less applicable to Cumberland and Westmorland than to any other county with which I am acquainted. This is sufficiently accounted for by the prevailing high rate of wages. A man who fairly earns from 18*s.* to 1*l.* 1*s.* a week is seldom disposed for further work at the conclusion of the day. The taste for vegetables among the other labouring class rarely extends, as I observed, beyond potatoes, which they prefer obtaining by the arrangement before explained, or by buying them in the market. I only met with one instance of allotments being in request and appreciated by agricultural labourers, namely, on property of Lord Kenlis in Westmorland, where small pieces of land from one-sixteenth to one-eighth of an acre are let at the rate of 3*l.* per acre, and I attribute this exceptional case to the allotments being situated near to the town of Kirkby Lonsdale which afforded a market for a part of the produce.

Allotments offered but declined.

86. Allotments in other places had often been offered to labourers in agriculture, but generally declined. Mr. Hasell, the chairman of the quarter sessions for Cumberland and Westmorland, stated to me that he had proposed a plan of allotments a few years ago, but it was not accepted by his men, high wages and regular employment not disposing them to work beyond their stated hours. The Rev. Wm. Dacre, the vicar of Irthington, Cumberland, also stated to me that in many cases the labouring classes do not care to have even gardens. "I tried the allotment system," he said "but I did not find it answer. The holders of the allotments would not cultivate with the spade, but "with horses and ploughs, and did not care about the allotments. The labouring class if good "workers are so well paid, and work so hard when they are at work, and are generally so well fed by "their employers, that they do not care to work in their gardens after the day's work is done; and bad "workers are too indolent to cultivate a garden."

The Rev. Christopher Benson, rector of Brampton, also stated that he had tried allotments but that the poor did not seem to care about them, and the Rev. Arthur Wilkin, rector of Bootle, informed me that he had a field let off into 28 allotments but that they were not appreciated. A few years ago when Bootle Fell was enclosed, from three to four acres were set apart for cottage gardens, but not being close to the village the cottagers would not avail themselves of them, although the greatest distance from the furthest cottage in the village was but half a mile. The rent was merely nominal.

Education.

High position of Cumberland and Westmorland in respect to education.

87. Cumberland and Westmorland take high place in educational statistics. The proportion of the population under instruction being, according to the report of the Duke of Newcastle's commission on education, in Westmorland 1 in 7·9, and in Cumberland 1 in 11·2, while the proportion in all England was at that period 1 in 11·82. Much has been since done in Cumberland to increase the per-centage, and it is probable that the county would now take a higher position in education than at the time of the inquiry above referred to.

Large proportion of educated adults.

88. The proportion of educated adults in the rural districts to the population is probably greater than in any other county of England, although the amount of education may be but moderate. The clergy of both counties informed me that very few persons who came to be married were unable to sign their names, and of those who signed the marriage register with a cross the greater number could write their names if pressed to do so.

Ample means of education.

89. There are 135 endowed schools within the diocese of Carlisle, which embraces the two counties of Cumberland and Westmorland, in which education is almost gratuitously provided for the children of the labouring classes.

Education generally appreciated.

90. There has always been a very great appreciation of education to a certain amount in both counties; endowed grammar schools are numerous; the various classes of the community are very much intermixed, and the children of the smaller statesmen, tenant farmers, and labourers generally attend the same school.

Endowed schools very numerous.

91. Of the 300 endowed and national schools in the diocese of Carlisle, only about 90 derive assistance from the State, and I heard frequent complaints of the effect of the proviso in the revised code which requires the amount of the endowment to be deducted from any grant to which a school may be entitled on inspection. Many of the small endowed schools are suffering from this enactment

L.

and have been obliged to economize by engaging inferior masters, and dispensing with pupil teachers. The means for providing elementary education, particularly when the small endowed schools shall have been placed upon a satisfactory footing, are ample for the wants of these counties if the labouring classes would take advantage of them.

Parents often indifferent to the education of their children.

92. The indifference of parents, and their desire to profit by their children's labour at an early age, are here as elsewhere the great impediments to effectual education. The practice of withdrawing children from school for four, five, and even six months at a time is common. One-third, and in some places one-half of the children do not attend school at all from the beginning of April until the end of October, and this absenteeism occurs chiefly among the elder children, who return to the school during the winter months simply to regain what they have lost during the months of continuous labour in the fields. The education of a boy who, after 10 years of age, leaves his school for five or six months at a time may be said to be virtually at an end. He will make no further progress, and in a year or two after he has entered farm service he will probably have forgotten nearly all that he ever knew. I found this to be the opinion of all the schoolmasters with whom I communicated on the subject.

Farmers favourable to education.

93. There are no prejudices against education on the part of the farmers in these counties; on the contrary they appear to value it highly. I often heard them regret that the ample means of education which are available were not more generally taken advantage of. They have no fear that, should education become universal, it would lead to a general rise of wages, but should wages generally rise, their view is that it would not necessarily diminish profits, for a permanent rise in wages must be followed by a corresponding reduction of rents.

Opinions favourable to restriction of early labour without a certificate of education.

94. I found a general concurrence of opinion in favour of an enactment that no boy should be employed in agriculture until he was 14 years of age, unless he could produce a certificate of a certain amount of school attendance, or of having attained a certain proficiency in reading, writing, and arithmetic, for example, in having been able to pass Standard IV., and that such an enactment would be attended with great advantage to the children of the labouring classes generally. It would introduce a principle of competition into the juvenile labour market, and present the strongest inducement to parents to push forward the education of their children. It would also act as a strong incentive to farmers to interest themselves in the same cause by giving them a motive to urge the labouring classes to perform their duty to their children, from which both parents and employers would be mutual gainers.

Indifference of parents the great evil.

95. When advantage is not taken of the ample means of education provided in these counties, it is to be attributed not so much to the poverty as to the indifference of parents. To counteract this, a system of moral compulsion has been found to produce an excellent effect in one of the largest of the schools which I visited. In the Penrith Boys' National school there are three rules, to the enforcement of which the master attributes the very high average attendance which he obtains. They are,—

1. No child may stay away from school without leave from the master. Leave of absence will be readily granted either by application personally or by note; this application must be obtained before and not after the child absents himself.
2. If any child makes a practice of coming late, or be absent without permission for several days, a form of enquiry will be sent requiring a reason from the parent.
3. If this form is not returned the child will not be allowed again to attend the school until a satisfactory answer has been given by the parent.

These rules have been found to act most beneficially; and one or two examples of expulsion for systematic irregularity of attendance have been attended with the best effect. The parents of the boys of this school are generally poor, the earnings of the children, therefore, in field labour, for which there is a great demand in that district, must be of considerable importance, yet the average attendance in a school consisting of 160 boys is kept up to 130, and the greater proportion remain until 13, and some to 15 and 16 years of age. Much good has also been effected by visits of the master to the parents when he finds the attendance of their children begins to flag.

Effect of irregular attendance on the finances of schools.

96. The apathy of parents in respect to education is without excuse. Even an offer of the payment of the school fees proves ineffectual to induce them to do their duty, or if, under these circumstances, they allow their children to attend school, the smallest excuse, such as a wet Monday, is sufficient to induce them to withdraw them for the remainder of the week. This not only entails the loss to the school funds of the children's pence, but, in many instances, renders it impossible to make up the number of attendances required for the Government grant; thus the children who derive the least benefit from the school entail by far the heaviest burthen upon its supporters. The neglect and indifference of parents is the more to be condemned because the children of Cumberland and Westmorland are endowed with remarkable natural abilities, and no schoolmaster could desire a better material upon which to work.

Endowed grammar schools very numerous.

97. I have before adverted to the number of endowed grammar schools in these counties. In Westmorland there are not less than 40 for a population little exceeding 60,000, *i.e.*, in the proportion of one school to every 1,500 inhabitants, and Cumberland has 30 schools of this description. These were long the only schools in the district with the exception of a few village schools, and in them the sons of the statesmen and tenant farmers obtained an education far above the standard of the present day.

A classical education was one of the wants of the time, and to place a son in the church was once a common object of ambition.

Not adapted to the present wants of the population.

98. Many of the statesmen endowed schools suitable to their peculiar social position, but the grammar schools have ceased to be applicable to the changed state of society. The sons of statesmen who formerly remained at school until they were 17 or 18 years of age became in time of too much value at home to permit so many years to be devoted to their education. They were wanted to assist in the work of the farm at an earlier age, and these schools have with some conspicuous exceptions declined in character and usefulness, and become comparatively unfit for supplying the educational requirements of the day. Without altogether neglecting the classics a good commercial education would perhaps be most valued by the classes who are in a position to benefit by a re-organization of these schools.

Grouping of the small endowed schools.

99. Another class of schools chiefly available for the lower classes consists of small endowed schools which are exceedingly numerous. Where the endowment is very small they are, to qualify them to receive the grant, generally submitted to Government inspection. Where the endowment is sufficient to

support the master, the trustees generally decline to place the school in connexion with the Committee of Council on Education. These non-inspected elementary schools are generally in a very inefficient state. In some of them, I was told by the Secretary of the Carlisle Diocesan Education Society, all the children in the two first classes were found to be decidedly superior to their master in acquirements. The system of grouping on Miss Burdett Coutts' plan has been successfully carried out in many of these schools. Six are combined and, with the consent of the trustees, periodically visited by an ambulatory master, the effect of whose lessons upon the schools is speedily felt. They afterwards compete for prizes on inspection. It has required much management to induce the old and generally incompetent masters to submit to inspection, but there are now on an average three combined schools in each rural deanery of the diocese. The system of grouping is not confined to the small endowed schools but all small county schools are admitted provided they comply with the proposed conditions. L.

100. The necessity of a change in the management of the small endowed schools of these counties has been so strongly urged by Mr. Roby, one of the Assistant Commissioners of the Royal Commission on the endowed schools of England and Wales, that I beg to quote his opinion in corroboration of my own. Reforms required.

"There can be no manner of doubt that in many instances the endowments as now administered is a source of unqualified evil; it introduces a body of trustees who, if the clergyman is not one of them, are altogether unfitted for their duties; it acts as a retainer for an incompetent master who without it would probably be provided for at the workhouse, and it takes away the main inducement, as it must always be, to invite Government inspection, viz. the chance of obtaining substantial pecuniary aid. But it is scarcely possible to conceive a wider gulf than that which separates the cleanly, well-ordered, cheerful school, which thrives under a well-earned Government grant, from the slovenly, neglected, repellent aspect of the worst non-inspected schools."

The farmers of these counties, while generally acquiescing in the importance of interposing no unnecessary obstacles to education, rarely omitted to dwell upon the importance to the children themselves of habituating them in a moderate degree to labour while young; therefore, schools combining industrial employment with elementary instruction were considered as best suited for children in agricultural districts. Industrial schools desirable.

101. There is scarcely anything at the present time in the constitution of our rural schools to counteract the natural tendency in those who have received a tolerable education to evade husbandry as an occupation for life, and to seek employment and preferment in towns. The earliest and most successful of the attempts to combine labour with instruction in the education of the children of the labouring classes originated in Cumberland. Mr. Curwen, whose zeal for the welfare of the agricultural labourer I have had occasion to notice, was one of the first to direct his attention to the subject, and his plan for adapting education to the real wants of the rural districts was so successful that I hope it will not be considered out of place in this Report if I venture briefly to allued to it. He established in the town of Workington, in close proximity to his great model farm, a school comprising 300 boys. He connected this school with his farm, and on it the boys learned their first lessons in agriculture and were taught the value of labour. A certain portion of the school was told off every morning and marched, under officers selected from their own body, for their good conduct, and receiving a higher rate of remuneration, to the farm. They were thus enabled to earn not only sufficient to pay for their schooling, but to clothe and partly maintain themselves. The school was thus not only self-supporting, but a source of pecuniary gain to the parents themselves. It was also a school of admirable moral training, for no boy was permitted to work unless he was attentive at school and his character was good; and as a small portion of the earnings was allowed for pocket money, such a prohibition was felt not only as a degradation but as a pecuniary loss. Work changed its nature and became a privilege and an enjoyment. The revolution effected in the demeanour of the boys, who were the children of the lowest classes of Workington, was of the happiest kind, and from intractable and unruly little barbarians they became examples of docility and obedience. Mr. Curwen was justly proud of his success, and says, in describing the plan, "I have more pride and more pleasure in this institution "than in anything I possess, or than I ever accomplished in the whole course of my life."* Mr. Curwen's industrial school at Workington.

102. Schools on Mr. Curwen's plan seem to be most suitable to the rural districts, and to present the fairest prospect of solving the problem of combining due attention to the development of the intellect and the physical powers of boys with the interests of agriculture. Such schools would be nurseries of agricultural labour, and might afford material aid to farmers in seasons when juvenile labour is most in request. Arrangements might be made with the schoolmaster instead of with the gangmaster, and children old enough for employment in farm work might be formed into companies and employed on farms, under proper superintendence, without detriment either to their morals or their health. Schools organized on this plan doubtless require a certain concentration of population. Large agricultural villages or towns can alone supply an adequate number of boys to take an effective part in the work of farms. The dispersion of the population of Cumberland and Westmorland over a wide area forbids the hope that such schools would be found generally applicable to those counties, but there are several places, such as Workington, Whitehaven, Wigton, Cockermouth, Carlisle, Brampton, Penrith, Appleby, and Kendal, all connected with important agricultural districts, where they might be established with every prospect of success.‡ Schools on this principle best adapted for the rural districts.

103. The earnings of children in field labour are, no doubt, often of considerable importance to the parents in paying for their clothing or otherwise contributing to their support. Value of children's labour to the small statesmen and tenant farmers.

* The President's Report to the Workington Agricultural Society, 1809.

† The labour account of the school might be kept distinct, and the fund after certain deductions divided among the parents.

‡ The establishment of industrial schools seem to have attracted much attention in the last century. The following extract from a speech of Mr. Pitt shows the importance which he attached to them:—

"Experience had already shown how much could be done by the industry of children by early employing them in such occupations as they were fit for. The extension of schools of industry was an object of national importance. If any one would take the trouble to compute the amount of all the earnings of children who are already educated in this manner he would be surprised when he came to consider the weight which by their own labours they took off the country, and the addition which by the fruits of their toil, and the habits to which they were formed, was made to its internal opulence. The suggestion of these schools was originally drawn from Lord Hale and Mr. Locke, and upon such authority he had no difficulty in recommending the plan to the encouragement of the legislature."—Speech on the Labourers' Wages Bill, Feb. 12, 1796.

L.

Among the class of small statesmen and tenant farmers of Cumberland and Westmorland, the price of a boy's labour if brought into the market, would by no means represent the value of that labour to the parent. The sum earned in occasional employment might not be more than 3*l.* or 4*l.* during the year. If a small tenant farmer or statesman is unable to do all the work on his farm himself, he hires a servant; but if the work is too much for himself and not sufficient to afford full employment for another man, the inducement to keep a child from school during the busy months to assist at home, rather than hire a farm labourer for the half year at a cost of 10*l.* or 12*l.* with his board is very strong. In such a case, the saving which the parent is able to effect by employing his children at the sacrifice of their education, is too great to be resisted, for in the case supposed, the average annual money value of a child's labour would be only 3*l.* 10*s.* but the hiring a servant for a half year would involve an expense of 18*l.* or 20*l.* reckoning both wages and food. It will be readily understood from this calculation how strong the inducement must be among the class of small proprietors and tenant farmers to work their children on their farms instead of sending them to school, and I conceive that it affords one of the strongest objections to such small properties and holdings.

Proportion of school life to be devoted to labour.

104. The difficulty in fixing upon the proportion of a schoolboy's life that should be devoted to labour is no doubt great, but from the opinions which I heard expressed by some of the most intelligent and experienced schoolmasters whom I met, I am induced to think that such an arrangement as the following would, in this district, be productive of satisfactory results. If a boy goes to school at five years of age and attends regularly until he is 10, he will, in all probability, be able to pass standard IV. If during the next two years he attends school for a prescribed number of days during intervals of work, he will probably be able to satisfy some of the further requirements of the Revised Code, while he has also been gradually becoming familiarised with his future employment. On finally leaving school the change would not be so great; he would not be so awkward at his new work as if he had never handled a hoe or bound up a sheaf, and he would also have been able to render some assistance to his parents, and he would, without having acquired much general information, have the means of carrying on, if so disposed, the work of self-education, the only education, as has been often said, of any real value, with success.

Hours of labour in the case of children not objectionable in Cumberland and Westmorland.

105. There is little to object to in the counties upon which I have the honour to report, either as to the number of hours children are employed in field labour, the distance they have to go to their work, or the ages at which they are employed. Generally children have not to walk more than a mile or a mile and a half to their labours, and in most instances shorter distances. I met with only one case in which children were required to go great distances, namely, in the vicinity of Cockermouth, where I was told they had to walk out and home a distance of 10 miles. Children are very rarely worked under 10 years of age, and many farmers refuse to employ them until they are 12 or 13. Bird tenting is not much resorted to; ploughboys are not wanted, the plough being invariably drawn by two horses abreast and the reins held by the man who holds and guides it. Thinning turnips by the hand is generally the first labour to which children are put, but as some care is required for this work very young children are not employed.

Long average attendance at schools.

106. In nearly all the schools which I visited the children generally continued to attend with more or less irregularity up to the age of 13, and frequently 14. The children of the smaller class of statesmen leave school earlier and have generally made less progress in their education than those of other classes, owing to the demand for their labour at home.

Non-attendance at school the fault of parents.

107. The high rate of wages rarely places parents in these counties under the absolute necessity of looking to the earnings of their children for assistance, and if poverty is pleaded as an excuse for not sending children to school, offers of assistance are often refused or if accepted are not taken advantage of.

In almost every part of the counties which I visited instances were brought to my notice of parents systematically neglecting this duty to their children. In the town of Brampton, for example, where there is an excellent national school, the attendance of such children whose schooling was paid for was more irregular than that of other children, and a boy 10½ years of age, whose school pence were paid by a lady, attended school only five days in seven weeks, and the attendance of another boy under similar circumstances amounted to only 13½ days in three months.

Farmers' suggestions with regard to future education.

108. Before bringing my remarks upon the state of education in these counties to a close, I ought to record the opinions of several of the most enlightened farmers with whom I had the advantage of conversing on one portion of the subject which they conceived to bear especially upon their interests.

They thought that if any steps should be hereafter taken by the legislature in the direction of compulsory education, it should be borne in mind that inasmuch as the owners and occupiers of the soil would be the persons on whom the burthen of rates for schools must principally fall, they should receive special consideration, and as the children of the rural population would constitute by far the larger proportion of those who would attend such schools, it would, they conceived, be but reasonable that the means should be placed within their reach of acquiring a knowledge of the first principles of agriculture, and of its allied sciences,—botany, chemistry, and geology, and the increasing use of machinery in farming would render it highly desirable that the future labouring classes of the community should receive some instruction in the elements of mechanics.

Early labour not the cause of neglected education.

109. I have appended to the Report a table showing the extent to which a great many of the schools which I visited are affected during the six busiest months of the year by the employment of children in field labour; but a far more serious evil results from the systematic neglect and indifference of parents. Out of 20 boys between the ages of 10 and 13, whom I stopped within the space of half an hour, and questioned in the streets of Cockermouth, eight had never attended any school. "So "far as early labour is concerned," says Mr. Jenkinson, a considerable landed proprietor in the neighbourhood, "there is no reason whatever why all under 13 should not go to school; ample pro- "vision is made at a cheap rate, but they will not take advantage of it, and the parents as a rule "care nothing about sending them to school, the consequence is that the streets are swarming "with children all the day, doing all sorts of mischief." In another town (Egremont) deriving support both from mining and agriculture, and containing, with the suburban districts, a population of 3,480, Mr. Thomas Nelson, of Catgill Hall, states, "There are day schools amply sufficient for those who are "inclined to send their children to them at an easy charge, but the advantage taken of them is very

"limited; I do not consider early labour a bar to their attendance, but the negligence of parents in "the great majority of cases." At St. Bees, the centre of an important agricultural district, Mr. Carter, one of the largest farmers, says:—"There are multitudes of idle boys who will not take "advantage of the means of education provided for them, but the fact of working has nothing to do "with it. There will always be found such characters in all places until education is made compulsory. "These are not the characters that are fondest of early work."

Night schools and association for mutual improvement.

110. Night schools, excepting in a few of the towns, are rare in these counties. The term "school" is not liked by young men who have entered upon a career of independent industry, and they prefer calling them mutual improving associations. The Burton Mutual Improvement Institute is a good specimen of such societies; any resident in the parish above 13 years of age and subscribing a penny a week may be a member; the class or lecture rooms are open three evenings in the week, and the reading-room every evening except Sunday. The success of this association has been in some degree owing to its originators having introduced a popular element into its government. Four agricultural labourers were placed on the committee, they take an active and useful part in the management, and their presence divests the society of that patronizing character which is too often apt to attach to such institutions.

Remarkable exemption from crime.

111. Cumberland and Westmorland present a remarkable contrast to most other counties in the general prosperity of their population, and they are singularly exempt from crime. Such serious offences as burglaries and highway robberies are unknown; and I cannot bring these observations to a close without stating that it was announced in a report of the chief constable of these counties, a year or two ago, that in the returns made to him by his superintendents, there was not recorded a single person or house under the respective designations of "known thieves or depredators," "receivers of stolen goods," "prostitutes," "suspected persons," "houses of receivers of stolen goods," "beershops of bad character," "coffee shops of bad character," "houses of ill-fame," and "other "suspected houses."

112. In conclusion, I beg to express my sincere thanks for the uniform kindness and hospitality which I experienced while prosecuting my inquiries in these counties, and for the readiness which all classes with whom I had occasion to communicate evinced to afford the information which I sought.

I have the honour to be,
Gentlemen,
Your obedient servant,
J. HENRY TREMENHEERE,
Assistant Commissioner.

May 22, 1869.

Great profits made by the "badgers" or middlemen	156
Early age at which children are employed	„
Effects of the system as now pursued upon the intellectual and moral condition of the children	„
Testimonies to the evil	„

To Her Majesty's Commissioners.

Gentlemen,

1. Having been instructed to prosecute some inquiries in reference to the employment of children, young persons, and women in agriculture in the county of Lancashire, and it having been intimated to me that it would probably be sufficient for the purposes of the Commission if I restricted my investigation to the northern part of that county, where probably some interesting facts might be collected as to the effect which the higher rate of wages and improved mode of living prevailing in the adjacent manufacturing and commercial districts have upon the material prosperity and social condition of other portions of the county, I now have the honour to present my Report on the points to which it was suggested that my attention should be chiefly directed.

2. The portions of the county which I visited are:—

Districts visited.

(1.) The Furness district, which is bounded on the north, east, and west by the counties of Cumberland and Westmorland, and which, from its geographical position, may be considered almost as an integral part of those counties.

(2.) The Valley of the Lune, which extends from the town of Kirkby Lonsdale to the embouchure of the River Lune, below Lancaster, which gives its name to the district.

(3.) The extensive tract which lies between the rivers Ribble and Lune, called the Fylde. I will preface the observations which I have to make by shortly describing the physical peculiarities of these districts.

Another district, that of the Hills, not visited.

3. There is another part of Northern Lancashire, known as the hill country, north of Preston, and which extends from the London and North-western Railway to the borders of Yorkshire.

This being simply a district of small sheep and dairy farms I did not feel it necessary to visit; but it has been so well described in a paper contributed a few years ago to the Journal of the Royal Agricultural Society by Mr. W. Garnett, of Quernmore Park, Lancaster, that I beg to quote his account of it:—

"The inhabitants of the hills are a manly and independent but rather uncultivated race; shrewd enough as far as their own immediate interest is concerned, but incapable of looking forward; unwilling to lay out sixpence this year in the chance of receiving a shilling next, and jealous to an extreme of any alteration or innovation on the customs of their fathers. Many families have lived on the same farms for generations, and by frequent intermarriages they have become connected together almost like one family, and, with a strong attachment to their native hills, care little to receive or visit strangers."

"Their farms are not large; some of the most important amount to 250 or 300 statute acres of enclosed land, with a large right of sheep pasture over the moors adjoining, and held for the most part on yearly tenancies. The stock on the farm is generally all the capital they possess, which consists of a herd of milch-cows and their calves of different ages, little or no care being given as to the breeding of them; a flock of black-faced sheep of very inferior quality, and a pig or two, with perhaps a couple of horses when the farm is large, make up the total of their property. They generally keep their land in grass, with a plentiful crop of rushes, which serve, as they say, "to keep it warm," or if they plough it up and take a crop of oats, which is the most they ever aspire to, they leave it to time and nature to grass it over again, and never think of putting any manure on; this is all preserved for the meadows, which are really of importance, inasmuch as they produce the hay which is to keep the stock through the winter. The hay harvest is, therefore, the most critical time of the year, and they give it all the attention they are capable of. They mow with large scythes, five feet or five feet six inches long, very heavy, and therefore slow in action, and they shake out the swathe, not with forks or any implement, but with the hands. The climate being precarious, and the population small, the haymaking on a moderately-sized farm takes a month or six weeks, part of July and August, and as it is made it is secured in close barns, not in stacks or open fields; two tons to the acre is a good crop. The produce of the cows is made into cheese and butter, mostly the former, and the whey given to the young calves. They have no green crops nor farmyards for turning the cattle into and preserving the manure during the winter. Simple and hardy in their habits, they have few wants beyond the actual neces-

saries of life. Their houses are built of the rough gritstone of the county, and the turf on the moors adjoining serves the purpose of fuel. Wheaten bread is a rarity, and the bakestone, or hot hearth, for baking the large oat cakes upon, forms a necessary appendage to the farmhouse and the cottage; in fact this is the case throughout the whole of North Lancashire. The oat cake is still the favourite food both of farmers and labourers."*

Northern district of Lancashire, the most advanced in agriculture.

4. The northern district of Lancashire is, perhaps, more advanced in its agriculture than any other portion of the county. There are many large farms of from 600*l.* to 1,000*l.* a year rent, and which produce excellent crops of wheat. Intermixed with the property of the large landowners are numerous small freeholds, the moral and political causes which produced the remarkable subdivision of land in Cumberland and Westmorland having given rise to the same social phenomena in a considerable part of North Lancashire.

The Furness district.

5. The Furness district is celebrated for the richest deposits of hæmatite iron ore known in Great Britain.

Great scarcity of agricultural labourers.

The mines materially affect the supply of agricultural labour. The wages of a common miner are so high that it is extremely difficult for farmers to procure any day labourers and still more so to retain them in their service. The deposits of iron ore being at an inconsiderable depth from the surface, the labour of extracting it partakes rather of the character of quarrying than of mining, and the employment, being highly paid, is eagerly sought. Remarking upon the great scarcity of cottages, excepting in the immediate vicinity of the mines, I was informed by a considerable farmer that it would be useless to build cottages for agricultural labourers in a county where, if you established a man in one, he would certainly abandon his work in a few weeks for employment in a mine. Farmers in this district, therefore, rely almost exclusively upon servants whom they board and lodge for the cultivation of their land. Even the lightest operations of husbandry, such as weeding crops and thinning turnips, are performed by men. Neither women nor children can be hired, and the cost of wages constitutes, under such circumstances, a very heavy item in the balance sheet of the farm.

The Valley of the Lune.

6. The rich and beautiful valley of the Lune forms a remarkable contrast to the district of Furness. The soil is a rich loam, in many places 10 feet deep, and capable of growing every description of produce. The whole of this valley of unsurpassed natural fertility is, however, in a state of permanent pasture. There is scarcely the trace of a ploughshare to be seen, and year after year its natural grasses spring up in the utmost luxuriance without the expenditure of a shilling on top-dressing or manure. It is a country of perennial verdure devoted entirely to grazing. Bullocks thrive so rapidly on the rich pasture that they require no other food to fit them for the butcher. The only labour required on a farm of 800 acres is that of two men to look after the stock and to keep the fences in repair. The scantiness of the population would alone prove an obstacle to cereal cultivation, and from its great natural fertility and the few hands required to manage even a considerable farm, it has probably been found most remunerative to keep this fine valley in grass. The rent of land varies from 2*l.* to 3*l.* per acre.

The Fylde.

7. The remaining district which I have to describe is that known as the Fylde, and which, in an agricultural sense, may be termed a modern creation. Linconshire has its fens, Yorkshire its wolds, and other counties have their distinctive peculiarities, but the improvement of moss or peat land on an extensive scale is one of the great agricultural features of Lancashire.

Great improvement of moss land.

8. The original mosses of the Fylde have been estimated at 20,000 statute acres, and, from a state of absolute sterility, a district once covered by them has been converted into a garden. The breadth of land under potato cultivation is probably greater, in proportion to its area, than in any other part of England. Luxuriant fields of beans, oats, and wheat also meet the eye on every side, and the only apparent trace of the bogs which formerly almost covered the surface of the county are occasional stacks of peat which present a somewhat gloomy contrast to the cultivation around, and which constitute almost the only visible traces of a moss once, in some places, 30 feet deep, the greater portion of which has been drained, cut, and carted away at an expense which has been abundantly repaid by the productive soil which has been created in its place. Land which was worth, a few years ago, only 5*s.* or 7*s.* 6*d.* an acre now readily lets for 35*s.* or 2*l.* The improvement and cultivation of the Fylde have been greatly facilitated by the presence of large quantities of marl, which, mixed with the lower portion of the peat, produces a soil of great fertility.

Population of the Fylde very scanty. Immigration of Irish.

9. The population of the Fylde is very scanty, and the greater proportion of the work on farms is done by Irish labourers who arrive in large numbers early in April and return to their native country about the end of September. Their ordinary wages are 2*s.* a day, finding their own food, with the exception of butter-milk, which is supplied to them gratuitously at the rate of a quart per day. At harvest time they have an additional 1*s.* a day. Wheaten bread is their only substantial food. They sleep in barns and outhouses upon straw, with a sack for a pillow. Their object being to save money, many carry back to their country from 10*l.* to 12*l.* of the wages of the half-year. They are most efficient labourers, and a more industrious, honest, cheerful, easily managed, and well-conducted class of men is nowhere to be found.†

The Fylde could not be cultivated without Irish labour.

10. This periodical immigration of Irish labour has become a necessity in the Fylde and is an essential condition of its cultivation. The men generally return to the same homesteads year after year, and employers and employed are mutually pleased to see each other again. If, from a closer approximation of wages in Ireland to those in England, or from any other cause, this supply of labour should at any time cease, it is difficult to conceive how the cultivation of the Fylde, in its present form, could be continued; in anticipation, perhaps, of such an event a tendency is already perceptible to lay down land in permanent pasture and to encourage the increase of dairy farms.

General scarcity of agricultural labour in Lancashire.

11. The general scarcity of agricultural labour in Lancashire is the necessary consequence of its vast manufacturing development. Its coal mines and cotton mills afford a remuneration far more attractive than anything that the farmer can offer; the great mass of the native inhabitants, therefore, reside in towns and the rural districts are comparatively deserted. It appears by the last census that three-fourths of the population of the county are engaged in commerce and manufactures or dependent upon them for employment and support.

* Journal of the Royal Agricultural Society, vol. 10.

† The number of Irish who take up a temporary residence in the Fylde amounts, I was told, to several thousands.

L. 2.

Women very little employed in agriculture.

12. Under such circumstances the employment of women in agriculture is, as might be expected, quite exceptional, and only in districts remote from manufacturing towns, andeven when so employed their wages approximate to those of men. I found in the Fylde 2*s.* a day, with their food, given women when they could be procured, even for the lightest agricultural work. In certain districts neither women nor boys can be procured, and work which almost everywhere else is done at a trifling expense by women and children is necessarily performed by men.

No agricultural gangs.

13. Agricultural gangs, whether public or private, are entirely unknown. In the seasons for planting and taking up potatoes, and for getting, dressing, and stacking peat, as in the Fylde, the father of a family often takes his children, with one or two of his neighbours', to assist in such work. This is the nearest approach to the combined employment of children and adults which I met with. On small farms the employment of the children of the occupiers at a very early age is as general as I found it to be in Cumberland and Westmorland.

Children engaged very young as farm servants.

14. An objectionable practice, however, prevails of hiring children into farmhouses as farm-servants at an earlier age than is consistent with their education. I found 12 a common age at which children are first engaged as farm servants. The paucity of adults available for agricultural labour, doubtless, partially accounts for this practice ; but there may be another reason for it, viz., an anxiety to secure labourers as young as possible and thus prevent their being attracted to the towns which, in this county, compete in the labour market so successfully with the country.

The farm servant system general.

15. Farm servants are almost as much employed in the north of Lancashire as in the adjoining counties of Cumberland and Westmorland, but their wages do not range so high; for, whereas, in Cumberland and Westmoreland 28*l.* and 30*l.* a year are not unfrequently paid to the higher class of farm servants, from 16*l.* to 20*l.* a year, with board and lodging, is the average rate of remuneration for that class in North Lancashire. The difference in the rate of wages in favour of the farm servants of Cumberland and Westmorland may possibly be owing to their superior efficiency, for I often heard Lancashire farmers express their admiration of the great physical powers, industry, and intelligence of the agricultural labourers of the adjoining counties.

Diet of farm servants good.

16. The mode of living in the farmhouses is much the same as in Cumberland and Westmorland. The diet is ample and good, with fresh meat always once, and in many places twice a day. Oatcake seems to be in more general use than wheaten bread, and is said to be preferred by the labouring classes.

Education of labouring classes not satisfactory.

17. The state of education among agricultural labourers is not so satisfactory as in the adjoining northern counties, a natural result of the early age at which the schooling of the children of the labouring classes generally ceases, the acquirements made at school being quickly lost from the want of opportunities of keeping them up.

Night schools not general.

18. Night schools are well supported in a few places, such as Heysham and Quernmore, near Lancaster, where the population is sufficiently numerous to support them, but the great distance of the generality of farmhouses from any village or town where such institutions are likely to be established must preclude young labourers generally from taking advantage of them.

Moral standard comparatively high.

19. The moral standard among the labouring classes in the county is higher than in Cumberland and Westmorland, and there is, I was informed by the clergy, comparatively little illegitimacy ; a state of things, I conceive, in some measure attributable to the very little employment of females in husbandry, women being more appropriately occupied. There is at the same time a public opinion on this subject which makes itself felt and has a decided influence upon the demeanour and character of young females even in the most secluded districts of the county.

Wages of day labourers.

20. The wages of agricultural day labourers are slightly lower than in Cumberland and Westmorland, except in those districts where the mines come in competition with agriculture. In such places agricultural labourers are paid from 16*s.* to 18*s.* per week. In the purely agricultural and pastoral districts wages range from 2*s.* to 2*s.* 6*d.* a day, often with the addition of certain privileges, such as permission to grow potatoes on the farmer's land and pasture for a cow. The material condition of the agricultural labourer is satisfactory ; there is little poverty and no distress ; and the general state of the rural population is one of prosperity and contentment.

Cottage gardens general and good.

21. Nothing struck me more than the contrast which Lancashire and the two northern counties which I had previously visited presents in the value attached by the people of the former county to gardens. They are generally of considerable size, and form a really important addition to the labourer's resources. Potatoes constitute the chief crop, but attention is paid to other vegetables; fruit trees are common and highly prized, and the cultivation of flowers is not neglected. A cottage without a good garden is the exception, but although most cottages have gardens all cottagers are not gardeners. There may occasionally be observed instances of slovenliness and neglect, but, generally speaking, the gardens are cultivated with neatness and care, in favourable situations and with a good soil often yielding a profit of from 3*l.* to 4*l.* a year.

Allotments procurable when desired ; small allotments preferred.

22. Although a labourer in receipt of good wages is often not insensible to the advantages and pleasures of a garden and is willing to bestow upon its cultivation such spare time as he can command, his appreciation of an allotment, even if not inconveniently situated, is not so common if it is large enough to require a considerable expenditure of labour to make it pay. To a poor man on low wages an allotment of even half an acre may doubtless be a most important addition to his means of living ; but an agricultural labourer in the receipt of high wages is seldom disposed to work much after the business of the day is over. He then naturally looks for amusement and social intercourse, and if he can often find these on the allotment ground he regards it rather as a place of recreation than of toil. I found instances of this in several parishes which I visited, and where allotments were appreciated, not for their size, but their comparative smallness. In Heysham, for example, the Rev. T. Royds lets off four acres, in pieces of one-twelfth of an acre each, and a farmer in the same parish lets the same quantity of land in similar proportions, and although the labourers renting them are in receipt of excellent wages they are readily taken up. At Cartmel a piece of land contiguous to the town is let in allotments of one-twentieth of an acre, although larger had been offered. The reasons for this preference of small to large allotments, when agricultural labourers are well off, are obvious, the work required being light men meet on the allotment ground, smoke their pipes, and chat with their neighbours. It thus becomes a place

of pleasant *réunion;* the crops (little vegetable delicacies, perhaps, which add a zest to a labourer's meal) are duly tended; the growth of the early potatoes, for which the labourer probably anticipates a good price, is watched with interest, and a taste for gardening is created which is often thus diffused throughout a parish.

Cottages good.

23. The remarks which I have made with respect to gardens apply almost in an equal degree to cottages. In no returns which I received to the circular of questions which I distributed is the condition of cottage accommodation described as otherwise than satisfactory. This favourable testimony was to a great extent borne out by my own observation. In some cottages the ventilation was obviously defective, but the number of rooms provided for the labourer and his family was generally sufficient; but it is found difficult where there are three bedrooms to prevent an occupier from taking lodgers and making all his children sleep in one room, an abuse which calls loudly for a remedy.

Great improvement of cottages in the Fylde.

24. Although the condition of the cottages in the parts of Lancashire which I visited is on the whole very satisfactory, I should state that the improvement is comparatively recent in one portion of the county. In the Fylde nothing could be more deplorable than the cottages which on its first reclamation from a waste were erected for the scanty population that could be induced to make it their abode. Hovels built of mud with thatched roofs and provided with only two rooms were the only habitations available for the settlers, as they might have been described, in this new territory. Some of these cottages remain, but by the liberal expenditure of the Earl of Derby and Colonel Clifton, the two largest proprietors in the Fylde district, these wretched dwellings are rapidly disappearing, and in their places have been built substantial brick cottages with slate roofs and amply provided with all the conveniences which a labourer's family can require. All have three bedrooms, and the rent is fixed less on a calculation of the outlay than on what a labourer, in receipt of fair wages, may be reasonably expected to pay.

Education.

25. I have but few remarks to make upon the state of elementary education throughout the districts which I visited. The supply of schools is ample, and, so far as my observations extended, are, with the exception of some small endowed schools in which the old type of master is still found, efficiently conducted. The only drawback to the satisfaction which the existence of good schools is calculated to afford is the indifference of parents (frequently half educated or wholly uneducated themselves) to the education of their children. Many of the answers which I obtained to the circular of questions pointedly comment on this evil.

Attendance of children good, excepting those of small farmers.

26. The attendance of the children of agricultural labourers is much more regular and extends over a longer period of the year than of small farmers. The Rev. Mr. Powis, the rector of Farington, states:—

"In my parish full half the year is almost, if not altogether, lost to education by the children of small occupiers. It is only where small farms prevail that the education of children is materially interrupted; the children of the labouring classes generally attend school fairly, and if they were not removed so young, the education they would obtain would leave little to be wished for, considering their position in life."

Savings' banks and friendly societies.

27. Habits of providence among farm servants and the labouring classes are common, but there is a greater disposition on the part of agricultural labourers to subscribe to friendly societies than to deposit their earnings in the savings' bank. In the extensive parish of St. Michael's in the Fylde there is an excellent friendly society which does much good; almost all the young lads become members of it when 14 or 15 years old, and the present number of benefited members, some of whom however reside out of the parish, is 236. The club has no connexion with any public-house.

Great abuse of children's labour in gathering shell-fish on the sands of Morecambe Bay.

28. I have now to advert to a subject, which, although it is not included in the terms of the Commission, is so important in reference to the employment of children and young persons, to the total neglect of their education and the permanent injury of their morals, that having communicated what I learned, together with my views on the subject, and it being the only instance in which I have had occasion to notice the abuse of children's labour in this county, I readily obtained your permission to notice it in this Report. I refer to the constant employment of great numbers of children and young persons in gathering cockles and other shell fish on the shores of Morecambe Bay. The business of "cockling," as it is provincially termed, appears to combine all the worst abuses of agricultural gangs, with some peculiar aggravations. It prevails on other parts of the coast of England, and I find a reference to it in a communication by the Rev. W. T. Becket, rector of Ingoldsthorpe, Norfolk, and diocesan inspector of schools in the deanery of Heacham,* in which that gentleman observes:—

"The remarks I have made respecting the employment of child and female labour in field-work are applicable also to the same classes in musseling and cockling upon our sea shore, which occupies a great number of women and children with the same injurious results morally, bodily, and religiously. I think the inquiry should be extended to that kind of labour, in order to prevent the increase of evils which might arise if restrictions were applied to field-work and not to shore work."

Money earned by "cockling."

29. The business of "cockling" is very lucrative. It is carried on by a class of men called provincially "badgers," a kind of middlemen between the persons actually employed in the work and the wholesale buyers, generally fishmongers in the manufacturing towns. Great numbers of children, young persons, and women who reside in the small villages around the coast of Morecambe Bay go upon the sands on every recession of the tide in parties of from 10 to 20, and pursue their occupation until the advancing tide compels them to return. The cockles lie about an inch under the sand, and their presence is detected by the appearance of a small hole; the cram, a small three pronged bent fork is then applied, and the shell fish is jerked by it into a basket held to receive it. The stooping posture required by this work for several hours is very trying. An expert "cockler" will sometimes obtain eight quarts in an hour, if cockling is "good." I heard of a father of a family who, with the assistance of his four children, frequently made as much as 4*l.* per week. The extent of this business may be conceived from the fact stated to me by the manager of the railway at Morecambe, that the carriage of cockles and mussels from that place alone to the manufacturing towns of Lancashire amounts to more than 2,000*l.* a year.

* Appendix to First Report, p. clxxv.

L. 2.

Great profits of the middlemen.

30. The gain of the "badgers" from the labour of the children employed may be estimated from the fact that a child or his parent is paid for the cockles collected at the rate of 5*d.* per eight quarts, called a "heap," which they sell at the rate of 1*d.* or 2*d.* a quart, thus making the profit upon the labour of these poor children from 150 to 200 per cent., at the expense, as I shall proceed to show, of their intellectual and moral debasement.

Places where the employment is pursued.

31. The places in which cockling is chiefly carried on are Fleetwood, Poulton-le-Sands, Hest Bank, Bolton-le-Sands, Warton, Silverdale, Allethwaite, Flookborough, Bardsea, and Baycliff, on the shore of Morecambe Bay, and Sandscales and Southergate in the estuary of the Duddon. The number of children and young persons employed amounts, as nearly as I have been able to ascertain, to rather over 300.

Early ages at which children are employed, and its consequence.

32. The age of the children when first taken on the sands, or the "skeer," as they call it, is often only 5, but at that age they are sent more for the purpose of learning than for the utility of their services. Owing to the value of their labour to their parents, and the early age at which it is made available, cocklers are never sent to school, and grow up in a state of absolute ignorance, and, I fear I must add, of heathenism. The working together on the sands for many hours together of boys, girls, and young women, in groups, which generally keep near enough to carry on conversation, leads, as may be supposed, to great evils, and while at work, as well as in going to and returning from the sands, their language, is, I was told, in the highest degree obscene and profane. In the short intervals of employment, idling and loitering about the villages are their only amusements; and respectable persons shrink from coming within hearing of their language or observation of their manners.*

Testimonies to the greatness of this evil.

33. The Rev. T. Rigg, incumbent of Flookborough, says, in reference to the employment of the children of his parish in "cockling,"—

"The children employed go upon the sands as young as 7 or 8; they get no education, rarely going even to an infant school. The occupation is continuous throughout the year. One of the principal cocklers of this village has seven children on the sands, not one of whom has had the slightest education. All the children and young persons engaged in this occupation are in a very demoralized condition; their habitual language is shocking, and they never enter a place of worship. At 14 both boys and girls become so independent that they frequently leave their parents and board and lodge with strangers, spending their earnings, even at that early age, in drunkenness. It is very desirable that some restriction should be placed by law on the age the children should be allowed to pursue this occupation. I think none should be allowed to go on the sands before 11 years of age."

The mother of three girl "cocklers" at this place says,—

"My girls are out on the sands from 10 to 12 hours together, and in spring tides they have to walk five miles to the banks. They have nothing while away but a piece of bread, of which they eat a bit now and then, just to keep off hunger. None of my children ever went to school."

The Rev. Canon Hurbersty, vicar of Cartmel, says,—

"When I was the incumbent of Allithwaite I saw much of the system of cockling. It is the only abuse of children's labour that we have to complain of in this district, and I am of opinion that in any legislation for the regulation of early labour, this class cannot with propriety be omitted."

The Rev. Robert Gibson, vicar of Bolton-le-Sands, says,—

"Almost all the children in my parish are engaged in the cockling business. They receive no education except, perhaps, some little at the Sunday school, but being unable to read they derive little benefit from that. I certainly think it very desirable that the labour of these children should be brought under some legislative regulation. There are some hundreds of them in the villages around Morecambe Bay."

I did not hear that this employment produced any injurious effect upon the health of the children, although it is difficult to suppose that protracted labour, barefooted, on the wet sands for hours together, should not lay the foundation of diseases which must manifest themselves in after life.

In concluding this necessarily brief Report, I beg to express my thanks for the assistance rendered me in my inquiries by persons of all classes with whom I had occasion to communicate. To the clergy, especially, my acknowledgments are due for the readiness and zeal with which they entered upon the discussion of any subject on which I felt that it would be desirable that I should obtain their opinion and I shall always entertain a grateful remembrance of the kindness and hospitality with which I was everywhere received.

I have the honour to be,
Gentlemen,
Your obedient faithful servant,

August 10, 1869.

J. HENRY TREMENHEERE,
Assistant Commissioner.

* I may mention a circumstance connected with this subject which came under my own observation. Being a few years ago at one of the small cockling villages of Morecambe Bay, I ascertained that a "badger," having collected his workers of both sexes, was accustomed to shut them up for the night in a barn which he hired for the occasion whenever the state of the tide made it desirable to be upon the sands at early dawn. I have no reason, however, to suppose that anything so bad is now practised.

INDEX TO SOME OF THE PRINCIPAL SUBJECTS.

Allotments, Nos. 5, 65, 66, 197.
Allotments for a cow. *Chester*, 158; *Salop*, 188–9; *Stafford*, 199, (6), 209.
Benefit societies, 228–240
Cottages, condition of. *Dorset*, 4–6, 31, 43, 58–61; *Kent*, 81, 83, 130; *Chester*, 167; *Salop*, 177–8, 191–6, 198–9; *Stafford*, 210, 214–5.
Cottages, control of, 6, 20, 62, 63, 168, 169.
Diet, &c., 4, 5, 10, 11, 31, 73, 156, 180.
Employment, restrictions on—
of boys; *Dorset*, 4–8, 12, 13, 23, 35–6, 40–1, 43–5; *Kent*, 76–81, 84–5, 113, 118, 120, 127, 174, 190-2; *Chester*, 144–7, 150–1, 159; *Salop*, 168–9, 171, 174, 190–2; *Stafford*, 199 (*a*), 201–2.
of women (outdoor); *Dorset*, 4, 6, 36, 40; *Kent*, 81, 84, 86, 92, 96, 101, 109, 113, 127; *Chester*, 144, 147; *Salop*, 168–9, 172; *Stafford*, 199 (*a* and *b*), 200.
of women (indoor); 144–5, 150–1, 154, 157, 164, 181.
Schools, effect of fieldwork on day. *Dorset*, 54, &c.; *Kent*, 128, &c.; *Salop*, 194; *Stafford*, 199 (*c*), 213; *Rutland*, 219, 220.
night, 24, 31, 56, 84, 129, 195.
half-time; *Oulton*, 148; *Rostherne*, 152–3; *Bradwall*, 154; *Middle*, 183; *Quatt*, 221; *Tarporley*, *Ellesmere*, *Acton*, 222.
industrial, for girls. *Quatt*, 221; *Stokesay*, 223; *Sandbach*, 225.

1. TABLE showing the comparative Duration and Regularity of School Attendance in the under-mentioned Counties (compiled from returns sent in to the Commission).

Mr. Stanhope.

g.

	Per-centage of Children on the Books who are between 10 and 13 years of age, in Summer and in Winter respectively.				Per-centage in average Attendance (1), under 10; (2), between 10 and 13 years of age.							
	Boys.		Girls.		Boys under 10.		Boys from 10 to 13.		Girls under 10.		Girls from 10 to 13.	
	Summr.	Winter.	Summr.	Winter.	Summr.	Winter.	Summr.	Winter.	Summr.	Winter.	Summr.	Winter.
Kent - -	27	29½	30	33	73	73	63	72	74	69	65	73
Dorset - -	19½	22	26½	28⅓	80	78	59	57	86	78	76	69
Chester - -	32	32	30	29	76	78	69	73	76	76	72	73
Salop - -	27½	30	30	33	70	71	63	67	64	66	51	57
Stafford - - (From few Parishes only.)	20	24	27½	31	68	74	68	89	69	75	78	76

Note.—Boys appear to be withdrawn from school soonest in Dorset, and latest in Cheshire.
Attendance is *most* irregular in the case of the younger boys in Salop, and of boys over 10 in Dorset. In the latter case regular employment is indicated by there being no improvement in the attendance of these boys in winter.
Girls attend most irregularly in Shropshire.

Mr. Stanhope.

g.

2. TABLE, founded on the Census of 1851 and 1861, to show the comparative Employment of Juvenile and Female Labour in the under-mentioned Counties.

Counties.		Male Agricultural Labourers.	Between 5 and 10.	Between 10 and 15.	Per-centage under 15.	Female Agricultural Labourers.	Under 15.	Increase or Decrease. of Female Labour.	
								Increase.	Decrease.
Kent	1851	Outdoor 41,462	143	3,549	8½	520	51	—	—
		Indoor 4,994	4	254		1,756	140	—	—
	1861	Outdoor 43,186	163	3,604	8	589	50	69	—
		Indoor 3,698	3	352		252	14	—	1,504

		Indoor 7,389	21	1,463		1,632	15	—	302
Stafford	1851	Outdoor 18,556	28	716	6	455	19	—	—
		Indoor 5,770	6	756		984	82	—	—
	1861	Outdoor 18,494	13	935	8	412	12	—	4
		Indoor 4,629	13	883		1,316	39	332	—
Rutland	1851	Outdoor 2,486	5	195	9	8	—	—	—
		Indoor 409	2	49		6	—	—	—
	1861	Outdoor 2,911	14	254	9	10	6	2	—
		Indoor 339	1	26		127	3	121	—
Lincoln	*1851*	*Outdoor 39,840*	*127*	*3,080*	8	*589*	*53*	—	—
		Indoor 10,878	*5*	*769*		*769*	*57*	—	—
	1861	*Outdoor 42,984*	*211*	*3,669*	9	*729*	*104*	*140*	—
		Indoor 9,897	*8*	*843*		*3,417*	*249*	*2,648*	—

[From this table it appears—

(1.) That far the largest proportion of *boy* labour is employed in Dorsetshire.

(2.) That *outdoor* regular female labour is most employed in Dorset, but is very much on the decrease.

(3.) That indoor female labour is most employed in the dairy counties of the west, and is very much on the decrease.

3. TABLE showing the Per-centage of Marriages where Marks were substituted for Signatures, and of Parishes which have Night Schools in the under-mentioned Counties. Mr. Stanhope. g.

Note.—The former is extracted from the reports of the Registrar General, the latter from that of the National Society (1868).

Counties.	Per-centage of Marks to Marriages.				Per-centage of Ecclesiastical Districts in which *Night Schools* exist.
	Males.		Females.		
	1855.	1865.	1855.	1865.	
Kent - -	30·6	20·5	31·9	20·	27
Dorset - -	30·8	25·2	35·7	24·9	44
Chester - -	32·1	23·7	50·8	37·7	23
Salop - -	39·3	29·5	46·6	33·6	13
Stafford - -	44·3	38·2	56·7	47·6	24
Rutland - -	31·8	20·5	23·4	26·9	31

Read thus:—Out of 100 men married in Kent 30·6 did not write their names; 27 in every 100 parishes have night schools. The per-centage of marks to marriages is of some value as a *comparative* test. If so, the state of education is far lowest in Stafford, but among females very low also in Cheshire and Shropshire.

DORSETSHIRE.

Dorsetshire.

4. *The Rev. Lord Sidney Godolphin Osborne*, Rector of Durweston.

Is legislation required for the purpose of fixing the age below which boys should not be allowed to be employed in farm labour?

In answering this question I must first observe, that in my opinion there should be a very strong case made out to justify interference with labour at any age, where the actual power to do the work for which wages are paid is sufficient. Such a case is made out when it admits of proof that there is an age when prolonged physical exertion, or exposure to excess of wet, cold, or heat, must so far injure in the child the growing constitutional forces, as to make it inevitable that its health will be permanently affected. In another view a case may be made out, viz., that there is an age at which the child should not be removed from the influence and protection of the parents and "the home;" an age at which child companionship is of great value to children, and the mixed society of the labour field prejudicial. The child sent out to work is in a great degree removed from all that nature seems to have pointed out as proper and profitable for child life; it is yet wanting in much which can alone qualify it for that life, which is one of all toil, or at least one that can afford it play time only in *tired* time. There is still one other view of this subject, if it is held to be the duty of the State to see that none of these children are reared in ignorance. As it must be admitted that to secure the mere rudiments of education requires a certain number of years, it follows that legislation may wisely interfere to prevent children going to work until they have acquired at least this much of education. In my opinion, no male child should go to farm work before the age of *ten* years; it would be more wise to make the age *eleven*.

At present, children do go to farm work at 10 years of age, and even under. Although it would in a paper of the nature I am now writing be impossible to state in detail the various forms of injury thus done to them, I have no hesitation in stating as the result of long experience and observation, that the seeds of much *physical evil* are thus planted in the soil of their life; the fruit may not be, I cannot say it is, a shortening of that life, but it is seen in their after years, in a way to me most clear; there is a want of physical energy, of what I may call labour pluck, a deadening of mind and body force; they may work up to what they are worth, as regards the value of what they do in the labour market, but even this is done after a very listless fashion, they form farm machinery in their mass, but the motive power is weak. In after life, and especially in its latter third, they are subject very generally to rheumatism, and other indications of the effects of exposure to all weathers, on low diet; had they started in life with power to earn more, they would have been better fed. That they yet live, as the rule, to a very advanced age, I admit; but their latter years are those of men, paupers and afflicted.

The taking them away from home so early, the giving them that sort of independence which a boy soon assumes who has entered the labour field, their early association with adults of all ages and characters, all this is prejudicial to them. What they there hear and see goes to destroy many of the most valuable natural dispositions of their age. They are boys before they have ceased to be mere children, act and speak as men before they have ceased to be boys.

I believe that where there is a good infant school and the usual day school, well conducted, an amount of education may be given before the boy is even *nine* years of age, which will enable him, if so disposed, to read fairly, write with some facility, and do sums in arithmetic, equal to any demands his position in life may require. Where Sunday schools exist, and they do so very generally, what has been thus acquired may be further advanced, that is, presuming the managers of such schools have the good sense to combine some secular teaching with that justly considered as more appropriate to the day. I have observed of late years, that there is a rapidly increasing desire, in the boys of the agricultural class, to improve their scholarship; the parents also set now a higher value on their education. In the night schools which have been carried on by members of my own family, we have the most satisfactory proof of this being the case. The result is just what I ever expected. A very large number of boys who went through the day school, the Sunday and night school, acquire an amount of education which makes them restless *at home, i.e.*, working after the manner of their forefathers at farm work in their own parish;

Dorsetshire.
Mr. Stanhope.
g.

they go out into the world, and get higher wages in employment of a character they know they never could have obtained, had they not persevered in acquiring the knowledge it demands.

Seeing then, that education is of this value to the agricultural class, that it can only be obtained in its rudiments at an early age, and that it can be so acquired without that injury to the physical power which farm labour is likely at that age to effect; seeing also, that at this early period of life it is better for them to be under school discipline, rather than have that too early independence, and too early association with their elders which the labour field is sure to entail, I think that no boy, as the rule, should leave school to go into regular farm work before the age of 11 years. The only way, however, in which I can see it possible to arrive at such result, or to approach it, *by legislation*, appears to me to be, to enforce the rule, that no boy, *where there is opportunity for him to be taught*, shall be hired for regular farm work until he can read fairly, write with ordinary accuracy from dictation, and be able to answer questions in the early rules of arithmetic. I believe the result of such legislation would be that the boys would be physically better able to work without injury to health; they would be in some degree better protected against the evils of too early association with the mixed adult labour of the farm; they would be more intelligent, and have just got enough of education to lead them to seek more whenever it may be offered them.

That thus some inconvenience would be felt on the part of employers, for young, very young labour is valuable, I admit; that the parents would feel the loss of their earnings, cannot be denied; that it would follow that very many would leave farm work at from 18 to 20 years of age for better paid, more intellectual, *i.e.*, less monotonous, drudge work, I have no doubt. But all this only brings me back to a conclusion at which I have long since arrived, viz., that it is a problem yet to be solved, how low class work, requiring little mental cultivation, can hope to retain the service of those whom education has taught to think; has made, after a sort, socially ambitious; caused them not only to feel that the work they do can be done with less mental cultivation, and that this cultivation has qualified them for work more grateful to them, and far better paid. The diminished supply to the family cupboard, the prolonged cost to the parents, of children who do not earn, would be borne patiently, in the hope that such children were gaining a qualification for another position in life, one which would make them not only independent of all parental help, but probably enable them to help their parents in their old age. It may be said there is little real difference between the going to work at 10 or 11 years of age. It is my conviction that the eleventh year is just the most valuable at school; education drudgery is then reaping its fruit, and the boy then first feeling its value in the ease with which he learns, learns more, and values more what he then learns.

I do not see my way to any rule to limit the hours of work in the case of boys. I am satisfied it might in many cases be feasible to work them alternate days, the intermediate days being given to schooling; but I cannot see, having regard to the distance they go to work on the farms, and the nature of that work, how at any given hour, the juvenile labour could be called on to cease, it is so amalgamated with the adult labour.

"Is legislation required for the purpose of fixing the age below which girls should not be employed in farm labour?"

I have no hesitation in saying that, in my opinion, there is no greater evil, social and physical, affecting the agricultural labour class, than the employment of young girls in out-door farm labour. They are the destined mothers of another generation; on their healthy condition as wives will much depend the health and strength of the parents of both sexes of that generation. In this climate of ours the alternations from dry to wet, from heat to cold, are so capricious, that the trial is severe to male labourers; their acclimatizing is not obtained but at much physical risk. The physique of the female is in many most important features very different from that of the male; and just where it differs most, lies the greatest danger to health, from over-tasking the strength, and exposure to cold and wet. In the young growing girl are found those constitutional features which make her especially liable to life-long injury from overwork, work in seasons in which she is exposed to great fatigue under rapid changes of atmosphere. It is quite true that women do in some places go out early to field-work, and do so work to an advanced period of life without shortening existence. But I have yet to be told how much cruel suffering it has cost them; and how many have sunk under, or had life made miserable in the attempt to do this. I have no hesitation in stating it to be my opinion, that regarding simply the physical phase of the question, it were better that no female under 16 years of age were allowed by law to work regularly at out-door farm work. I am not prepared to say that in the hay and corn harvest girls of good health, between 13 and 16, might not be employed, without any great risk, any more risk than at other hard work, and I cannot deny that in indoor service a great deal too much severe work, and to them dangerous work, is for ever imposed upon them.

As to the social or moral feature of the question, I am satisfied that field work, when entered upon at an early age, or even at any age, is as the rule most destructive to the female character. It is sad to write, but it is incontestibly true, that whenever any number of females work in company at farm work, especially when in that company there are also some male workers, the conversation is of a character most destructive to all purity of thought; affording also every temptation to learn that coarse language which is the free translation of thought impure. It is folly to expect that from the very nature of the things which surround the birth and rearing of a class where little can be veiled, and young ears are early accustomed to hear very free conversation, we can preserve to our poor people's children that modesty which we profess to value ourselves. We have in all these questions to consider the inevitable compromise which character, in thought, speech, and habit, has to make with earning industry. We cannot raise labourers without some regard to what labour will afford them in the matter of food and shelter. The best of cottages leaves necessarily much undone, that a mere moralist might wish for, of what is necessary to rear up children according to that standard which we might, as moralists, desire. It is the tax that poverty pays, its most direct tax, that the preservation of absolute purity of thought must be sacrificed at a very early period of life. It being thus, it does appear to me incontestable, that it is our duty to do all we can to preserve, as long as we can, young girls, so inevitably disposed to be precocious in knowledge of a demoralizing tendency, from that mixed association which necessarily advances that knowledge in a degree at their age deadening to all modesty, and destructive of all in the contrary direction, which good schooling may have taught. The Poor Law, I believe, puts the age at which children are no longer to be chargeable on the parents as such at 15. I assume therefore that at this age the law gives adultship to them. If therefore it should be held necessary to lay down an age before which no female child should go *to outdoor* farm work, I do not know that a better one could be chosen, than that, which the law has already named as that in which childhood may be said to altogether cease.

I cannot say that I am aware that there is ever any difficulty in the case of the children or young persons working on farms, obtaining time for their meals. There can be no doubt, that the distance to which children of either sex have to walk to their labour should be considered as so much of the actual day's

labour exacted from them. I am of opinion that between the age of 11 years and 14 no child should, as the rule, be called on to work more than 10 hours in a day, including the time required to go to work and return. I assume that at least one hour is allowed for *meals*.

Without writing at a length for many reasons undesirable, I could not go into all the details necessary to be considered, if legislation was to rule a hard and fast line as to the distance from their home children are to work on farms. There would be found many difficult questions in the matter, arising from the different nature of the employments in which the work of children is valuable. In some, the child, once on the ground, has comparatively little call to walk any more, the work being of a nature done on one spot; in other cases, it is walking all day.

I cannot see my way to any definition at which legal enactments could arrive, as to what employment in agriculture is so unhealthy and unsuitable for women as to make it necessary to legally exclude them from it. Anything which tends to form in women masculine habits, in my opinion, is unsuitable; everything which overtaxes female power, and is dangerous to the female constitution, is unhealthy; there is much in female farm labour which it needs no argument to prove must act in both directions, and the same may be said of many other species of labour where women work with men, or are set to work requiring prolonged muscular labour and exposure to wet and cold. I, therefore, can only say that, believing as I do, all outdoor female labour to be as the rule unsuitable and unhealthy for women, I yet cannot see how the law could step in to prevent it. Women must earn; their earnings form an important part of the family revenue, and when and how they are to do it is a subject most difficult, if not inexpedient, to define by law. I am not aware of any species of farm labour which can be considered as exacting anything which can fairly be called want of decency in those employed.

As to education, its amount, &c., where there are good schools accessible to the children, which is now generally the case, I believe there is every disposition on the part of the parents to avail themselves of them. It is no proof to me that the schooling has been defective, because after a year or two, or less, of working, the boy or girl may be found to know little of what it had professedly been taught. The flow of learning once interrupted, in every class soon proves how easily lessons are forgotten after lessons cease. I have my doubts whether it is not very rare that children are kept from school through the poverty of the parents. Village schooling is very cheap; there is great convenience in getting them away so long each day from the cottage; they wear out less clothing; being further from the cupboard there is less crying out for food.

There doubtless are cases in which there is some indisposition on the part of the parents to forego the weekly earnings of children. Where the family is large, if one or two children could only earn their shoes and some portion of their clothing expenses, it is a very great gain, and one the loss of which must straiten the means of the family. I have long, however, been of opinion that the very extensive use of young labour has the effect of keeping down the value in the market of adult labour. But the direct immediate gain to the parents is in the way of any view, which would lead them in agricultural work to pursue the policy "of trades," restricting arbitrarily the supplanting of the adult by the cheaper labour of the very young. They have yet to learn that children being left longer at school in greater numbers would probably tend to raise their own wages.

As to the low moral tone of the agricultural labourer, in the case of ordinary labourers, *i.e.*, those not under the pressure of circumstances, fast becoming exceptional, I don't believe in it. I believe a labourer, as the rule, is as moral as any member of any other class. Where circumstances have tended to demoralize the labourer, he may be idle, a drunkard, one who swears and breaks the Sabbath, perhaps a poacher, or dishonest. But comparing class with class, I assert that the good of this class are as good as those of any other; the bad are certainly not worse; they may pursue vice after a coarser fashion, but it is the same vice. We are apt to forget what we all like to deny, but yet must know to be true, that the crime and immorality of the labourer being more or less a nuisance and injury to those above him, is for ever exposed, reprobated, pursued by the law; that of the rich has an amount of privilege, from the fact, that their vices, whatever of ill they may cause by the force of their example, are of a nature which custom, fashion, the ways of their world seem to condone on the ground, that the sinners' sins do little injury to the persons and property of others, are primarily most hurtful to themselves. As to what is known as immorality, there are a certain number of illegitimate children born in our villages, and the marriage ceremony is but too much one following what it ought to proceed, and the more attention is called to this state of things, from the fact that illegitimate children and their mothers become a burden to the poor rate, unless their support is made a matter of magisterial decision. In either case that sin is published, which in other classes admits of far easier concealment, and we are also in justice bound to bear in mind that upper class licentiousness has a field ever open to it as yet, thank God, not open to the men of our villages in any serious degree. Adultery is little known.

With regard to the wages earned by this class it is very difficult to get at the truth. My own belief is that in the county of Dorset 11 shillings a week, taking all earnings throughout the year, is as high as they can with truth be put. I include in this all advantages whatsoever, and also all labourers (male) at farm work who are considered able-bodied. I also assume that a great deal of this is earned at task work, work done by the piece. I am quite satisfied of one thing, that be the wages what they may, it is generally admitted, and acted on, that good labourers, the best of them, are ever on the verge of pauperism, a week's interruption of work generally throws them on the poor rate; a sick child; the confinement of the wife, any the least excuse for union aid is made and rarely refused. The relieving officer's books will prove the truth of this. It is clear to me that this class are as much pauperized as ever they were in my recollection, indeed, I cannot see how they could be more so.

It must in fairness to the employers be borne in mind that when a tenant farmer takes a farm he makes the rate of wages of the district and the poor rate important elements in his calculations. Union rating has the effect of producing very naturally great laxity in rate expenditure. For his own immediate interest a farmer will not help to raise the district rate of wages. As the relief comes out of the whole union, he, as naturally, cares little to be strict in contracting the relief which enables his men to work at wages inadequate for their support if not thus supplemented by relief from the board. The result has ever appeared to me to be that the low rate of wages obtains only a low amount of labour. Men so fed and so paid do perhaps all the work that such pay and sustenance can fairly demand. I much doubt whether if the cases for the last 25 years of labourers who have been rewarded for long service and agricultural skill were closely examined, it would not be found that they had, as the rule, been in life very often paupers, very generally had been buried as such. It is within my own knowledge that in many cases this has been the case.

With regard to the cottages of the agricultural labourer, there has been, in the 27 years I have known Dorset, the greatest improvement. I see it in my own parish; I can travel nowhere and not see it. It is

Dorsetshire.

Mr. Stanhope.

g.

true I could point to a few notorious localities where the state of the dwellings of the poor is disgraceful to humanity, but these are now exceptional, the fact very often arising from the embarrassment of the proprietors absolutely preventing them laying out one farthing on their estates which they can avoid. The great legal obstacle in the way of cottage building is identical with that which affects the whole question of estate improvement. So long as estates can be tied up for generations, loaded with settlements, and so parchment-hampered that the proprietors are such far more in name than in fact, society at the same time expecting them to live up to the standard of their supposed proprietorship, it is clear that estate improvement is out of the question. What can be done, when anything is attempted, is chiefly in the direction of making the farms larger to save repairs, &c., and get higher class tenants. This certainly may carry with it some cottage building, but the real working of the system is simply this, that where there must be pressure it falls heaviest on the lowest class of the estate. And hence it is, so long as labourers can be got to work on low wages and dwell in crowded bad cottages, there is little probability of it being otherwise. Legal enactments which shall give embarrassed landed proprietors power to sell land to pay their debts, or the charges arising from the debts and extravagance of their predecessors, would remove some of the obstacles to cottage building; but there must be a very great change of public opinion before we can hope for the day, which must arrive, when the questions which relate to the inheritance of real property and its encumbrance, will come under that direct legislation which shall in any way obviate some of the most evident evils of the present system.

The old obstacle to cottage building, the argument that the rent does not pay proper interest for the expenditure, is fast becoming less and less. It is seen that labourers are not creatures of the open air; that they must be housed; that the house must be in some consistency with the habits and breeding of the being for whom it is built. As I said many years since the time would arrive when outdoor labour would come more in this respect under the category of domestic service. We don't regard the bedrooms and the servants hall of our houses in their cost as a matter of money return; we must have the maids and men; to have them we must find them house room. I am of opinion that the improvement of the cottages of the labourers, which is now in Dorset and other counties so marked, will yet continue. It is difficult already to retain on most estates a good supply of efficient labour; there is a leaven at work amongst this class of labourers, which will ere long, as I believe, produce a state of things analogous to that which has so disturbed every other labour market; education has begot thought, and thought is fed by the cheap press, which now circulates in our villages. I anticipate a time, *not far distant*, when this class will rise still further above that mere local serfdom, which in its past history has so characterized it; it has learnt what has been done by law to protect other species of workers, to give them a higher national status; it will apply that lesson to further its own interest. The extension of the range of settlement has worked to destroy parochialism with all its old loyalty and subservience to parish authorities. The agricultural labourer is now a unit of a great national interest. While every "interest" is questioning its own *right*, he will take his place in the struggle. He will get higher wages; he will not with these be content with the old cottage hovel. I already see symptoms of this, and I know some of the largest landed proprietors, foreseeing what must come, if a little late in doing so, are yet showing that a new way of dealing with their labourers must be chosen, if good contented labourers are to be retained on their estates.

I regard the Commission in connexion with which I am now writing as valuable evidence that at last the agricultural labourer's condition has so pressed itself or been pressed on the attention of the legislature, that whatever it can effect to ameliorate that condition will be done; that whilst it is held wise to give to this class education, the effect of such education will be studied, and endeavour made to provide that what is taught in the school is not neutralized, either by the circumstances which attach to a bad home, or to labour in itself morally prejudicial, or where it is not so, to labour too exacting on the physical powers of the age at which it is undertaken.

It remains only that I should now advert to one of the great sources of poverty and demoralization, which is, I think, beyond all contradiction, the habit of excessive drinking which so extensively prevails. It is strange, but true, that at the very time when the utmost energy and zeal is at work to enforce total abstinence from strong drink as a virtue of the highest order; when every argument is put forth to prove that such drink is altogether prejudicial; in our hospitals, in the treatment of the poor under the Poor Law, there never was a time when the medical men so profusely order it to be given. An inquiry into the present expenditure of hospitals and Poor Law unions for brandy and porter would in its result astonish the public. I have had experience in workhouse management, more or less, from the first days of the present Poor Law. When I regard the enormous amount of porter and brandy ordered for the in and out door paupers at the present time, I am induced to ask how was it the case that when, say, some 20 years ago, we so rarely gave these stimulants, we yet had equal longevity, we had no real evidence offered that the paupers suffered from the want of them. I am satisfied that the effect on the poor is bad, it gives them a craving for the use of that which is too costly for their position, it also tends to strengthen a habit, the one of all others, the easiest pursued to excess, such excess being their ruin. It is curious that more beer and cider is consumed in the counties where wages rule the lowest. In some measure this may arise from the fact, that a lower class of being is content to give his low class of work for such wages, and thus is one more disposed to mere animal enjoyment. If education raises the man, one would hope that with his rise may come a desire for a character of a higher grade. The very worst parishes with which I have ever been acquainted, I have ever found to be those in which there are the greatest number of low beer-shops. I know no one source of evil to compare with that which arises from the way in which the labourer is thus tempted to become a drunkard, and being one, to poison in his family all the school can teach; to waste their means and thus secure their pauperism. I am happy to say the employers are now very generally paying beer money to their men, instead of the beer or cider given in the field. This is a valuable step in the right direction. It does not force the sober man to either drink, or lose that which formed a portion of his wages. But no good will be done in the way of any serious arrest of the evil until legislation restricts the number of these small beer-houses, and places them all under better supervision. There is a fine for the drunkard; so far the law stigmatizes drunkenness, and yet the law sanctions the greatest competition amongst a class of dealers whose profits so much depend on the promotion of drunkenness. The beer-shop, as it is, is now the greatest impediment in the way of raising the labourer's condition, it is, of all, the most destructive of the work of the church and the school.

When requested to write on the subjects comprised in the instructions of the present "Commission," I was reminded that I had written a paper for that of 1843. I did so, and its publication brought on me an amount of local animosity hard now to be believed. I will only add that to every syllable of that paper I still adhere. How true it was has been well proved, by the great change in public opinion and public action in the matters of which it treated. Now, as then,

I have endeavoured to state my own conscientious opinion, founded on an experience of more than 27 years in the county from which I write. How far what I have written may be of any great value it is not for me to say.

S. Godolphin Osborne.

October 23, 1868.

Dorsetshire.

Mr. Stanhope.

5. At the monthly meeting of the Dorchester Farmer's Club, on Saturday, January 30, 1869, Dr. Aldridge, F.R.C.S., read a paper on "Agricultural "Hygiène," of which the following is an extract:—

(1.) The air they breathe, and the houses they inhabit:

What are the conditions necessary to protect our rural population from exposure to the noxious effects of daily living in an impure atmosphere, whereby their physical energies are impaired and disease engendered? In the first place their homes or cottages should be erected on somewhat elevated situations, well drained, with a south or south-western aspect, and removed from the effects of marsh malaria on the one hand, and the noxious gases emanating from confined and exposed fœcal matter in farmyards on the other. It is absolutely necessary that all should have the beneficial effects of light and air, but this is unhappily overlooked in the construction of the dwellings of our rural population; not only are their cottages placed in unhealthy situations, and oftentimes exposed to noxious miasma, but without any suitable ventilation, for it is evident that if the air within an apartment be not continually renewed from without, it will necessarily become loaded with animal effluvia as to be literally unfit for human habitation or for the purposes of respiration. There is no doubt that very many lives are sacrificed every year from want of proper ventilation, more especially amongst our industrial classes, and so ignorant are our poor of the importance of ventilation, that it is a fact that in the model cottages recently erected in London the means of ventilation provided have actually been stopped up by the inmates, with the object of keeping them warm. "In a sanitary point of view (says Dr. Combe) "it becomes a matter of great practical importance "to determine the amount of fresh air that ought to "be supplied to every individual, as necessary to "healthy respiratory action. Suppose each individual "inhales 16 pints of air per minute, and returns 4 "per cent. of the respired air as carbonic acid, we "have an hourly consumption of 120 gallons of air, "and a formation of five gallons of carbonic acid." 120 gallons of air, then, is the lowest amount which must be supplied hourly to every individual for respiration, provided all the carbonic acid is carried off as formed. But a much larger supply will be necessary if no means are adopted for carrying off the carbonic acid; in other words, if there be no outward ventilation, the proportion of carbonic acid in the atmosphere is about four parts to 10,000, and consequently if five gallons be diffused through the air, 5,000 will be required to give the proportion of ten parts in 10,000. Hence though 120 gallons, or 19·25 cubic feet of air would, with perfect ventilation, be a sufficient hourly supply to yield the necessary oxygen, an individual would require 5,000 gallons, or 802 cubic feet, if shut up in a close room, when all renewal of air is impossible to keep the carbonic acid from exceeding one part in 1,000. In ventilating apartments, therefore, the object must be to remove the foul air as fast as it is formed, and for this purpose a minimum supply of 250 cubic feet of fresh air should be hourly introduced for every individual. Every bedroom should have direct access to the outer air, either by the window being slightly opened or the door on ajar, which with an open chimney secures the proper supply of pure air. Now what do we see in our cottages amongst the labouring classes in rural districts—not only cottages built on ill-drained situations, and surrounded on all sides by noxious gases, small, low, ill-constructed, with the entire absence of all attention to ventilation; bedroom, for seldom do we find more than one, without a fireplace, lighted by a window, perhaps, two feet square, half of which, perhaps, only opens; the room not more than 5 feet 6 inches in height, and accommodating a family of, perhaps, two parents and five or six children of different ages, the atmosphere of which, when I have had occasion to visit such homes in times of sickness, could only be compared to the black hole of Calcutta, and quite as injurious and fatal in a degree from the existence of the same causes. And if the respiration of pure air is so important to our rural adult population in their cottages, how much more important is it to young children. And to what other cause is to be attributed the great mortality which exists amongst the children of the poor, as the imperfect oxygenation of the blood through the daily respiration of atmospheric air impregnated with excessive carbon from the want of proper ventilation? This may be more particularly traced by the development of tuberculous diseases in some form or other, which proves yearly so fatal to large numbers of our young people in rural and town districts; but my time will not allow of my making more than these general remarks, and indeed it would not be suitable to further enlarge on the present occasion.

I may say, generally, that cottage accommodation hereabouts is certainly very defective. It is true that much has been done by many landlords, but still very generally the cottages occupied by agricultural labourers are radically very bad. And the high rate of mortality in our country proves the deplorable state of its sanitary condition. The necessity of a remedy is continually forced upon our attention. In England alone it is estimated that 150,000 persons are annually attacked with typhus fever, of which number 17,000 die. This dread disease appears in several forms, but the most fatal is certainly attributable to impure air and water, and, as this is oftentimes attributable to the treatment and disposal of domestic refuse, this may be considered a most prominent feature of the question. The usual mode of collection has been generally to provide a cesspool or ashpit immediately joining the convenience, which is made the receptacle for cinders, ashes, vegetable refuse, and fluids of all kinds; to this is added human excreta. The removal takes places at different periods, and it is not difficult to conceive how, in the meantime, this mass of putrifying matter, especially when encouraged by heat, putrifies, and decomposes, and in this way generates all those poisonous gases and the hosts of animalculæ which, combined, produce that fever so fatal to children and adults, which is known to our profession by the name of typhoid fever. In addition to this, from imperfection in the characters of the cesspool not being water-tight, the liquid in its polluted state finds its way by percolation to the wells, from which may be drawn a considerable portion of the water for town and village purposes. A striking instance of this kind was noticeable in this very street. When the cesspool system was done away with, and deep drainage with water supply instituted, in several of the wells at the bottom of this street the polluted liquid matter from cesspools in close proximity were seen to be percolating through the solid chalk, and in this neighbourhood the prevalence of typhoid disease had been noticed.

(2.) The labour they are engaged in:

With respect to the *employment* of the agricultural labourer, very little can be said on that subject, for of all employments, that of the agricultural labourer is not only the most primitive, but also the most healthful, for they find in their calling ample air and exercise, and of that character, such as walking, which is very invigorating. But I sometimes think that the continued and exhausting labour of the ploughman especially, is injurious, by inducing a collapse of the vital forces, which the period of rest and the slight nutrition afforded, is not sufficient to relieve him from. We often find that excessive exertion has an effect upon the nervous and muscular tissues, which

Dorsetshire.
Mr. Stanhope.
g.

gives rise to enfeebled health, from which oftentimes the individual never recovers, more particularly as he has not, as many other more favoured individuals, the opportunity of laying by, and getting weeks, nay months, of complete repose. How often was it observed during the Peninsula war that large numbers of our soldiers became invalided from long marches without intervals of repose and rest. Therefore I would most strongly advise a division of the labour to be made ; instead of the ploughman working eight hours consecutively, that the period should be divided equally, and at the end of four hours there should be two hours' rest, and then the labourer and his horses would, I feel assured, resume their work with renewed energy, whilst at the same time more efficient labour would be accomplished. The result of such a division, as in Scotland and elsewhere, would be seen in more vigorous health, and less premature decay. An agricultural labourer of 40 or 50 years of age is generally a much older man in constitution than a man of similar age who has been a mechanic.

No young lad should engage in farm labour more than eight hours a day under the age of 12, whereas on many farms they are called on to perform nearly adult work, to the prevention of proper muscular development, and very often to the production of tuberculous diseases.

Much of the excessive mortality may be safely attributed to two causes—excessive labour, with defective supply of suitable nourishment.

(3.) The *food* they eat, &c. :—

We now come to the subject of food, on which it will be only necessary for me to make a few general remarks. It is very important that the agricultural labourer should be supplied with proper food for the nourishment of his body. In his case the waste of tissue must be great, and therefore he requires a due supply of nutritious food to make up for the daily loss. The food should, therefore, be of a character easily digested and assimilated, nutritious, and inexpensive. But some persons may say that "It is very "difficult to combine these in the case of the agri-"cultural labourer." This I grant, but still at the same time think I shall be able to show that something in the way of improvement may be done. Digestion is the process by which those parts of our food which go to the repair and waste of the tissues and the formation of animal heat are made fit to be absorbed and added to the blood. The heat of the body is kept up by articles containing carbon and hydrogen, and the repair of the tissues those made up of nitrogen. Man may be supported as easily by food made up wholly of vegetable substances, as by that which is formed entirely of animal matter. The poor man, however, is unable to get a dinner of beef or mutton, and he is therefore obliged to fall back upon the fruits of the earth. When we examine carefully the composition of animal food, and that of vegetable substances, we can discover a close analogy existing between them. Thus we find albumen in meat, and also in the juices and seeds of nearly all plants. Also fibrin in meat, and in corn and other seeds and grasses we get a substance called gluten, which is identical in property to that of fibrin. More might be said upon this most interesting part of my paper, but I must not tax your time and attention too much for fear of wearying you. The food of the poor principally consists of wheaten bread, cheese, vegetables, and sometimes milk and butter or cream. Milk when it can be had is certainly one of the best articles of food we can have, as it contains all the elements of blood requisite for the support of the body. Cheese can be digested in small quantities by the healthy and active, but I sometimes think that too much of it is eaten by the labouring poor, as there is not that support and nourishment in the common cheese which is requisite for maintaining the strength of the body. When we turn to the vegetable kingdom we come to bread. This certainly deserves our first attention, and it is clearly the duty of the farmer, seeing how dependent his labourer is upon the nutritious character of the bread, it being that upon which he principally subsists, that the bread be made from the best wheat, and not, as too often is the case, from the pinched and unmatured corn called the tailing, which contains necessarily much less of the nutritious elements. With respect to the diet of children I would most strongly advise the use of the Scotch oatmeal as a most economic, nutritious, and healthful food, and I am satisfied that, could we introduce this article into consumption amongst our labouring poor, their little ones would grow infinitely stronger and more robust, and very many lives now sacrificed for want of sufficient nourishment would be saved. In districts where the labourer has a cottage and garden attached, he may have the meals varied by the vegetables he gets from the garden. The cottage and garden plan so excellently given by our esteemed president is by far the best for assisting the labourer in making up his housekeeping. Give the labourer his pay in money, and with his house and garden he will be able to live more comfortably, and bring up his family healthfully and vigorously, being supplied with an adequate amount of nourishment. Time would fail were I to enter more minutely into the various bearings of this important subject. This I may say, before leaving the subject, that I have not the slightest doubt but a great deal might be done to improve the diet of the labouring man by the ladies of the district teaching the labourer's wife how to make the best use of the food which a kind Providence has bestowed upon them, as well as pointing out to them that which is most nutritious and within their limited means. A clergyman (eight miles off) assured me that he had seen a piece of uncooked mutton, supplied to a labourer's wife, thrown under the table for the cat to eat. *She did not know how to cook it.*

I would also dwell upon the importance and value, as appears to me, of the allotment system, as not only a means for providing increased necessaries for the working man, by the cultivation of vegetables and other articles of diet, but other beneficial effects are produced in his mind, as a feeling of self-respect and comparative independence, thereby raising him in the social scale. But in addition to this, the cultivation of his little plot of land affords him recreation and amusement when his day's work is done, whereby he is kept from injurious associations and drunken habits in the village or town tavern in which he may reside. I am aware that many esteemed agriculturists, for whose opinion and experience I have the greatest respect, are opposed to the system, and are of opinion that no good is derived by the labouring man from his allotment. But from my own observation in this and other neighbourhoods I have always been impressed with the advantage which the system affords, by the improved condition of the labourer and his house and family. I would not here omit to mention and point out what is, I think, a powerful and efficient means whereby the social status and condition of the labouring man may be improved, more particularly from having now for so many years seen the good effects it has had upon the condition of our industrious mechanic and artizan. I refer to the great friendly societies which have now for so many years advanced and benefited the industrious classes of our beloved country. I firmly believe that the improved condition of that class is mainly attributable to those great societies. If it be a duty according to the highest code of morals to provide for those of our own household, or to "provide things honest in the "sight of all men," it cannot be less a duty to make such provision as the cost of a small sacrifice will ensure for unforeseen events. I would ask, what is more likely to produce in the hearts of all honest men a feeling of self-respect and independence than the ability of his being enabled to provide for his own and his family's maintenance in times of sickness and affliction ? There is no right-minded man but would

feel himself happier and more contented could he realize the fact that, by his own frugality and provident habits, he has, by connecting himself with one or other of those useful institutions, been enabled to secure a sufficient maintenance for himself and family during Nature's distress and decay. All this could be most readily done if they could be induced to lay by say one 6*d.* per week for such a laudable and important purpose. This would afford them, according to their age, 10*s.* or 12*s.* per week in sickness, and at the same time furnish means for a respectable burial in case of death. I would therefore respectfully urge upon you all the incumbent duty of pressing your labourers to connect themselves without delay to one or other of these societies. It is worthy of your consideration whether in making your yearly engagements with your labourers, that their connection with some friendly society should not be imperative, both for their sake and their families, as also for the interest of the employer and ratepayer.

In the discussion which followed the Vice-President (Mr. R. Genge) took exception to some of the remarks respecting the agricultural labourer being overworked. It had been the fashion to make out the calling of the agricultural labourer worse than it really was. He argued that the occupation of the agricultural labourer had much in it that was attractive. In the first place he lived in the purest of atmosphere, and a great part of his existence was spent in the fields, and he enjoyed the beauties of nature. His hours of labour were not long, and his work was not excessive, and on this point he could not at all agree with Dr. Aldridge. There certainly were seasons when extra exertions were necessary to save the crops which Providence bestowed, but on ordinary occasions the labourer began his work at 6 and continued till 8, when he got his breakfast, and then worked as hard as he could until 11, at which time he had half-an-hour for the refreshment he needed. From 1 to 2 he had another hour. Then came the most trying period of the day when the sun was shining hot. He was worked until 4 or half-past 4, when he got his "mammut," or second lunch, after which he was enabled to go on as long as the sun allowed him. He worked till sunset and no longer, so that supposing his day was 14 hours long, he had two hours at least for refreshment and re-invigorating his frame. He did not think that was excessive labour, and did not believe the Factory Act was at all required for the agricultural labourer. (Hear, hear.)

Mr. J. G. Homer, after warmly commending the lecture, said he thought one of the most important points referred to by Dr. Aldridge, was the proper supply of food to the labourer. The allotment system he believed to be of great consequence and almost a necessity to the rural population. He did not mean that a man should have a large extent of land, but merely enough to cultivate during his spare time on summer evenings, whereby he could produce a large quantity of nutritious food and keep a pig at very little cost. He considered a man with a family should not have less than half an acre, which himself and his boys could keep in excellent order. The farm labourers were under a great disadvantage in purchasing their food, as they were obliged to buy at the dearest rate. His men had often mentioned the high price they paid for provisions, and he had told them he could buy the same articles for two-thirds the price; but the fact was they were obliged to go to the small shops, and, under these circumstances, a man with 14*s.* a week was no better off than another with 10*s.* if he could lay out the money to better advantage. Dr. Aldridge had not referred to one disease of the labouring population—the rheumatism, which was caused by their lying down under the hedges when they were warm. The first thing a man did when mowing was to get enough wet grass to lie down upon during the rest of the day, and this was a good bed to get the rheumatism. He did not think the rural population were sufficiently advanced to take charge of the ventilation of their houses. They had windows if they chose to open them, but they very seldom did so, either by day or night.

Mr. C. H. Saunders said he had been much gratified by the lecture, and he agreed with Dr. Aldridge in all he had said, excepting with reference to the overworking. As to the allotment system he thought half an acre would be too much land. His experience showed him that where the people had good gardens and potatoe grounds, if their employers did not manage them the people would not attend to them. He had not much faith in the allotment system, and unless the men were differently disposed from those he had met, he did not think they would cultivate them in the way they would expect.

Mr. J. G. Homer observed that he intended to refer to the system of paying the labourers partly in wheat. 12 months ago he raised his labourers wages from 8*s.* to 10*s.* instead of the wheat, and some of them shortly after asked that the old system should be restored. He refused to comply; but it showed the attachment of the Dorsetshire labourer to the gristing system. He made a calculation the other day by which (with their house) he found they would be paid 12*s.* a week; but he knew they preferred going back to the old system of perquisites.

The Vice-Chairman said he would make a remark he had intended to include in his former observations. He believed it was of the greatest possible benefit to the labourer to have grist, and it was worth at least 2*s.* more a week to him, as they found by experience in eating home-made bread they would get more nourishment than if they had baker's bread, and Dr. Aldridge would doubtless agree that home-made bread was far more suitable to the labourer than what he purchased. Therefore it was far more advantageous to the labourer to get his grist from his employer than to buy his bread at, perhaps, a ½*d.* dearer.

Mr. Andrews inquired what was considered to be the proper quantity of land to be appropriated to the garden of a labourer's cottage? He had heard different quantities advocated.

The Vice-Chairman replied that the quantity should be in proportion to the size of the family. In having cottages built he should consider 30 or 40 perches would be enough for each cottage.

Mr. Whittle said he felt very strongly on the grist system, which he believed was an erroneous one, although he did not suppose any of his friends gave his labourers pinched wheat. (Hear, hear.) He thought if they paid in money rather than in kind it would be better both for the employer and the labourer, and the odium and reproach would not be brought upon the county, of which it was not deserving. He agreed with everything in the lecture except with regard to too much work being put upon the labourer. He could point in contradiction to the ruddy health of the labouring population.

The President (Mr. J. Homer) said that Dr. Aldridge had not been very liberal with regard to the labourer's food, as he had left out meat entirely. The greater part of their labouring men could, if they pleased, have meat in their houses the whole year—at least that was his (the president's) experience. Most of his men fattened two pigs every year, therefore it was their own faults if they had not always meat. With respect to gristing it was a question which had been "carpeted" and talked of very seriously as to whether or not the men of Dorsetshire should persist in it. Himself, and his father before him, during a period of 50 years, had followed it, and he believed if he were to pay his men two or three shillings a week more, instead of grist, they would prefer to go back to the old system. If he were a young man, beginning life again in a county where the system had never been adopted, he should discontinue gristing, because it was generally looked upon in the light of the truck system, and an impression prevailed that the farmers gave their men tailing wheat. It was true it was not the best wheat, but it averaged in his case

Dorsetshire.
Mr. Stanhope.
g.

60 lb. a bushel. He had a carter who had been with him 30 or 40 years, and left him about four years ago. He was giving him 9*s.* a week and three bushels of wheat. He went to road work at 12*s.* a week, but he only remained at it one year, when he returned and he asked to be taken back saying he could not live without his grist, and he had continued ever since. He merely mentioned this to show that these men, having their wheat and their fuel found them could not be broken of this method of payment. He would be obliged to get rid of every man at present on his farm if he wished to alter the system. With respect to allotments he had seen it in operation for the last 20 years at Martinstown, where Mr. Sturt had adopted it, and it had answered very well where there was an industrious man who would make the most of his half or quarter of an acre, though latterly there were some who had not cultivated their half-acre allotments as they should have done, therefore Mr. Sturt had divided them into quarter acre portions. He had come into town that day with a man who told him he lived entirely from his half-acre allotment. He paid 40*s.* or 50*s.* a year for his cottage and 13*s.* for the ground. Being asked how he lived he said he and his wife lived entirely from the produce of his half-acre of ground. He bought twelve loads of manure every year, and grew two crops of potatoes, greens, or other vegetables. He also said that he paid his rent every year by his bees, and no man had a more respectable cottage. He merely mentioned this to show what might be made by a man cultivating his half-acre properly. Unless a man had really time to cultivate the half-acre he would be better with a less quantity.

Dr. Aldridge expressed his thanks to the meeting for the kind way in which they had received the imperfect remarks he had brought forward on this very interesting question. He had endeavoured to make them as practical as possible, so as to lead to a useful discussion. Many gentlemen had offered observations on his paper, and the first he noticed was with regard to the over working of the labourer. He had never stated in his lecture that they were overworked. He had merely drawn attention to the subject. Having had some experience of the effects of work among the agricultural population it had struck him oftentimes, not that they do too much work, but rather their work was not equally divided, especially as regarded ploughmen. He had seen where men had been taken from their beds at six and worked till two, without the slighest possible cessation ; that the effect on the tissues was bad and tended to promote disease. He had thought it right to notice that point. In Norfolk the day was equally divided ; persons went home for two hours of rest and to take their meals, and then went on to work again. He would not lessen the amount of labour : he only suggested the advisability of dividing the eight hours' labour into periods of four hours each, with two hours rest for meals. They all knew from personal experience, when they went out partridge shooting on the first of September, how desirable it was to have lunch and how thoroughly it enabled a man to go to work again with renewed vigour. It struck him that some such plan could be conveniently carried out as it was in other counties. It had worked well in Essex and Norfolk. He thought it would be better both for man and horse. He did not wish to intrude his opinion, but it was his duty, in considering this question, to make such suggestions as occurred to him relative to the sanitary and physical condition of the labouring poor. There was another question with respect to home-made bread. He agreed with Mr. Genge that home-made bread was infinitely preferable to the bread sold by the baker, whose object was to make it as white as possible by the introduction of deleterious ingredients, no doubt sacrificing the nutritious particles. Home-made bread was infinitely preferable because it contained a portion of the bran which helped digestion and made the bread more nutritious. He had seen the bread the poor usually had, and it was of a different description ; it was made of pinched corn—he fearlessly made use of the word "pinched corn." He knew that the poor had been supplied with it ; it was immature corn that had run through the sieve ; it was like the "third run" in a brewery. He thought it was unwise and prejudicial in every way that this should be so, for the nutriment of the poor so much depended upon the bread they eat. As to meat, Mr. Homer said they had meat all the year at Martinstown—he suspected that Martinstown was an exception to the general rule. (Laughter.) He did not see it in his rounds. If the poor had meat it was not the most nutritious. They usually had pork, which was about the worst sort of meat they could have. Therefore he urged upon employers the necessity of their labourers being supplied with the best possible wheat, whereby the best possible bread could be made. He believed the condition of the agricultural labourer in Dorsetshire had been grossly misrepresented. He believed the labourer was no worse off than in other counties. The question of perquisites had been already mooted and the public are alive to it, and he thought if the club took the initiative and paid their labourers in money instead of in kind they would not have the reproach cast upon them to which they were constantly exposed.

With respect to cottages there were some in that neighbourhood very bad, some belonging to some of their best landed proprietors. He knew a cottage not half so large as the room they were in, without ceiling or floor and containing 8 or 10 persons, with a window certainly a foot square but without the possibility of being opened, the consequence being fever among the inmates. In Fordington the cottages were very bad. He ventured to say they would not fat their animals in such places—they would think them too bad even for that—and yet they were occupied by families of five or six individuals. In many of these cottages one could not stand upright, and the smoke, dirt, and filth altogether made a state of things not to be equalled in St. Giles'. He thought it was high time some notice should be taken of this matter.

A large amount of *fatal disease has been for many years the deplorable consequences*,—in fact Fordington has been a hotbed for the generation of the most frightful phases of disease. Cholera, small-pox, typhus, and typhoid fevers have many times *almost* decimated the parish as a consequence of the filthy and wretched dwellings of the poor.

6. The *Rev. W. Barnes, B.D.*, rector of Came, near Dorchester, and author of "Poems in the Dorset Dialect," &c.

It may be allowed that young boys would be none the worse for work of no greater strain or sameness of strain on their body and limbs than that of the hard games which they follow of their own will ; but the evils of continuous and hard daily work may be those of an overweighting of their young and yielding bones and an overstraining of their half-strung muscles with a too great length of stedfast work, or a too great sameness of limb action, so that whereas in the toil of play all limbs and muscles are evenly worked and strengthened, yet in hard and long lasting daily work some may be overstrained and marred.

That a boy may become, and be for a working life, a man of well-shapen and readily working body, he should have (I suppose) a nearly even action of all his limbs and muscles, and it is an evil of a great division of labour, that it often holds a man to one kind of work of one or of a few of his limbs, while the others are less or not at all worked, or that it holds him too long in one posture, or in an unhandy one, or in an unhealthy place, so that the reaction of his work unchecked by the counteraction of timely change, mars at last the shape and action and health of the whole body, and the man often carries, in his very shape, the tokens of his calling. And the sameness or overhardness of toil will mar the young and yielding bones and muscles of a child sooner than the set ones of full grown men.

I can see in a great gathering of labourers and farmers at a fair, that the young farmers are, in the main, finer and more shapely men, and men of a better bodily carriage, than are the often very ungainly, if not stunted, young labourers. It may be said, and allowed that the young farmers are of finer size from better food; but this is an evil worthy of all thought, that our labourers' children are so far underfed that they are stunted, and live on to take the heavy work of the land with less than man's full might.

The worse forms and less easy limb play of the labourers, however, must, I think, be too often imputed to a too early call to settled hard work.

I have thought that the gain of a year's too early labour is the loss of more than twice as much at the other—the later end of life—and that the community in the end always loses by the overheavy and overmuch labour of the working man.

Boys are sent out to work so very young under two forces:—

1st. The pinch of need, as on a father with four, five, or six children, and only his own two hands to feed and clothe them, so that as soon as the eldest can earn a shilling or two for the wants of the house, he must earn it, or else all the household must become less fully fed and worse clad.

2nd. The other force is that of the employer's will, that the boy shall go to work or that the father shall be dismissed, since there are jobs and kinds of work to which, if there were no boys to take them at their low pay, men must be put at much higher wages, and in such a case it is a gain to the employers that the boy should be put as high in the scale of heavier work as his powers can reach, and thence may come the evil of the overworked and marred boy and man.

Though small boys may very well be put to lighter work of hand and foot, such as bird-keeping and wardships of animals, and the carrying of fittingly light weights, and the handling of lighter tools, yet I believe it would be a great blessing to the poor, and in the end a gain to the community itself, if the two forces of which I have spoken could be so met without injustice to the master or the starving of the poor household, that the young body could be allowed to ripen to greater hardness before it were put to its hard work, and that the boy may be longer at school.

Women mostly go out to field work under the same two forces that take out the little boys, the want of earnings beyond the husband's wages, and the will of the master, who often hires a man with the condition that his wife shall go to field work whenever she is wanted. Some women choose to go afield, but many others go out only under a very unwelcome compulsion.

On several grounds I am sorry to see women at regular work in the field, otherwise than at haymaking and harvest. I have known children locked up in the house while their mother was out at work, and in such a case the mother would come home in the evening and most likely find crockery smashed, clothes torn, and furniture broken, with tokens of quarrels, and the house in disorder, while the children had missed the training of a mother's words and care.

With these losses and evils, as well as with the faster wear of shoes and other clothing, it is allowed by most mothers that even if a neighbour overwatches their children they do not gain much, if anything, by their field earnings. I think, moreover, that at outdoor work in which women become wet legged, from wet skirts, as among wet turnips, they sometimes take chills which leave ulcerated legs.

A wife without any child may, if she will, go to field work, though even in this case, as in others, there will most likely be a loss of evening comfort to the husband, who is less likely to come home to a clean hearth and his hearth chair by a clear bit of fire, and a ready evening meal, or in short, to a house awaiting his weary step with every little comfort it can afford.

As to bigger girls a little field work may be to them physically good, but the evil of it with them, and more or less with all women, is that it is mostly a very bad school of refinement, and from the too often coarse talk of the men, tends to tarnish the purity of their minds and feelings, and to make them "mannishly" coarse, and if the woman, one of whose missions is to refine the man, be made as coarse as himself, how can she refine him.

Cottage.—The great want for the improvement of the life and mind of the poor landsfolk is that of better cottages and of more of them.

The evils of very bad hovels may be of several kinds, and all of them of great weight against bodily health and improvement of mind.

One most awful evil is the want of rooms, so that there is a most unbecoming and pernicious nearness, not to say openness, of sex to sex in their bed rest, an evil to which we can hardly look in thought without seeing its taint on the mind.

Another evil is that of the overcrowding or closeness of rooms in which the working man dozes in unwholesome air, and rises only half refreshed, and although not ill, yet not in the sprightliness of high health and full strength. The house may be so bad in its floor, walls, or timbers that the housewife hopelessly baffled in her will to keep it clean and tidy, at last acquiesces in uncleanness and falls into a deadness of mind to dirt.

Where houses are too few for the hands that are wanted for the work on the lands, there comes one of two evils, either "strappers" come into the parish as workmen, and lodge in the overcrowded houses in the bad way of which I have spoken, or men come every day to work from some neighbouring parish, and whereas they rise in the morning with only their days strength, and spend a good share of it in reaching their work, so the master gets less than their full day's work, so if the man yet puts forth a full day's strength some of it is borrowed from tomorrow, and he becomes outworn before his time.

In either case the workman or the master is the worse for the want of a house, and it may be that the community is a loser by the man's shortened reach of working years.

I know of no other so good means of improvement of the tone of life with the poor as a good instead of a very bad cottage.

Some may look for too early results from improved dwellings, and may be ready to believe from some very short trial, that the slack housewives from dirty houses will always make a good house like the bad one.

The great good of the change may be seen in the generation of better housed children. The elders with a life settled to the hopeless hindrances of the bad hovel may not at once take a high tone of cleanliness, but it will be mostly caught up, like fashion, by the upgrowing daughters, and I have seen the tokens of a higher feeling within even four or five years.

I have seen appear around the rather lately built good house the well trained climbing plant blooming by the wall, and a bit of ground before the doors turfed into a tiny lawn, with a flower-bed in which the blooms were tied to sticks peeled to whiteness, and a housewife who had come this spring from a good house to a dirty hovel with a floor of rough stones said to me, "Oh! I have not relished a bit of "food since I have been in this dirty place. If I had "seen it before my husband was hired, I would not "have come into it."

It is a hardship to the labourers that all the cottages should be let with the farm. It opens room for cases of great tyranny on the part of the employer, and as often keeps the houses in a bad state of repair.

From my knowledge, such as it may be, though it cannot be very small, of the qualities of the mind which mark the West English landsfolk, I believe that while there are bad people among them as among all other men, the would, as they now do, very readily rise in life and feeling, wherever they could find the way of improvement.

I have seen improvements among the poor. They

Dorsetshire.
Mr. Stanhope.
g.

are better clad than they formerly were, and in the matter of food they no longer eat as they eat formerly in hard times, barley instead of wheat flour; but they have not, I think, risen in welfare at the rate of ranks above them, meat too seldom reaches their board, and when bread is dear, they are sorely pinched for clothing with food.

A good garden is a great help to them, and would be greater if farmers would all as many will not allow their labourers to keep a pig.

By the disappearance of small holdings of land, or of orchards, or rights of common, and the upmaking of great farms, a very discouraging gap has been made between the farmer and the labourer.

Formerly in a part of Blackmore where the holders of the common-side cottages with orchards could keep a cow on the common and in the orchard, if one of them was unhappily on the parish, his neighbours looked down upon him as fallen below their standing, but now I am fearful that the people of such places begin to look on the law relief as a right for which they may apply with as much honour as wages.

If the more national burdens, which are now bound up under a false name with the poor rate, could be sundered from it, I believe that the land poor might be nearly kept in their sickness and infirmity by the church through her weekly offertory, to which the healthy poor would very freely give. In the offertories of three Sundays I have lately received 7*s.* in coppers from the poor of this village. (Population 125.)

The Union Chargeability Act which was meant for the good of the poor, has put them in a worse than their former plight, as the employer now recognizes no duty towards his good labourer, but if he is ill for a week or two, he sends him off to the union, with some such words as, "I cannot pay two ways, to the "union for the man, and to the man himself," and now when a man has spent the strength of his whole life on the land of a parish, the land as soon as his strength is spent cast him off as an incumbrance.

What is wanted for the land labourer is a "rung" in the ladder of rural life, by which he may hope to raise himself by his industry towards a higher position. He cannot now hope ever to step from day labour to farming. The smallest of our now great farms is beyond his wildest hope, and so he toils without the hope that has led on the poor lad in commercial work to the honourable estate of the high risen merchant.

---

7. A meeting of the Blandford board of guardians was held on Saturday October 31st, when the Hon. E. Stanhope, Assistant Commissioner, attended to confer with the guardians upon the subjects comprised within the inquiry.

In the absence of the Rev. R. Farquharson, Mr. Malachi Fisher took the chair. There were present the Revs. J. Watts, T. H. House, A. W. Maunsell, and Lord S. G. Osborne; H. J. Bower, Esq., J. C. Mansell, Esq., Messrs. G. Hill, W. Fookes, J. Keynes, R. Roper, R. Fookes, John E. Tory, and 11 others. In the discussion which took place one of the guardians deprecated any interference. The less education labourers have the better. Whenever a boy can earn 2*s.* he ought to go to work. Some of his best men were uneducated. There was a school in his parish to which he did not subscribe, as he considered it a landlord's question. These remarks were received with some applause, and a discussion took place, during which the effect of education in withdrawing children for agricultural work was remarked on, and compulsory school attendance and rates were strongly condemned.

The employment of females was then discussed. Several gentlemen present were large employers of women, but it was stated that few young girls worked in the fields owing to the "gloving."

It was stated that two women were employed with every threshing machine. One guardian mentioned a case in his parish where a woman had lost a limb in this way. Another stated that within his recollection only four accidents had occurred in his neighbourhood. Others considered it less dangerous on a steam than on a horse machine. Ultimately the following resolutions were carried, one guardian declining to vote:

"That the board fully acknowledge the value of good early education afforded to the children of agricultural labourers.

"That they have the satisfaction of finding that there are few (if any) parishes in this union which do not already afford to such children every facility to be so educated.

"That they will be most ready always to promote in the labouring poor a desire to avail themselves of the benefits of education for their children.

"That with regard to the employment of young females in agricultural labour, they will gladly take into consideration any measures which may approve themselves as necessary to prevent moral or physical evil from such employment, where such evil can be shown to exist."

8. On Saturday, November 14th, some of the leading employers of labour in the neighbourhood of Dorchester met at the Antelope Hotel to confer with the Hon. E. Stanhope, Assistant Commissioner, on the subject of the employment of children, &c.

Among those present were Mr. J. G. Homer (chairman of Farmers' Club), Mr. R. Genge of Waterson, Mr. T. Roper of Little Bredy, Mr. Levi Groves of Knighton, Mr. T. H. Saunders of Watercombe, Mr. J. Pope of Symondsbury, Mr. J. A. Pope of Sutton, Mr. A. L. Cooper of Whitcombe, &c.

After some discussion, the following statement was unanimously agreed to:—

"That the employers of labour of this neighbourhood could dispense with the labour of boys up to 10 years of age, but that the loss of the earnings would be too serious to the family for them to be dispensed with entirely.

"That it would be better for the employers to have men with a better education than the men now have, and that they would wish to see boys kept at school at part up to 10 years of age, or taught to read, write, and do a little arithmetic."

9. Opinion forwarded by the Poole Board of Guardians, January 4, 1869.

1. Very few children are employed in agricultural labour before the age of 10 years.

2. Women and girls are only employed during the summer in haymaking and harvest.

3. The hours of employment for women and children are generally from 8 to 5, the distance from their homes would not usually exceed one mile.

4. Health generally good. Education under the superintendence of the minister of the parish, and the schools are well attended in each parish in the union.

In the out parishes garden ground varying from 20 perches to half an acre is attached to each house, and in the town allotments are let to all persons requiring the same.

10. Statement by the wife of a shepherd living in a cottage on a farm in a "close" parish in the neighbourhood of Blandford.

I have lived there for 27 or 28 years, I am not sure which. I have had 12 children that lived. There are seven living at home with me now. My second boy was only 7 when he went out to work. He was "bird-keeping." I can't remember whether he had 1*s.* or 1*s.* 6*d.* a week when he first went. Some of them did not go so young; but when a boy goes out he most times leaves school altogether. Now and then he goes back in the winter, but they don't generally allow it in the school.

We don't think it right for the girls to go out on the farm. We kept them at home at anything when they could earn 6*d.*, but not in the fields. As my boys got bigger they went on living at home. They were put to go with the sheep between 10 and 11 years old. They'd first get 2*s.*, and 3*d.* more for working on Sundays. At harvest, one boy has to stay with the sheep, the others go to help on the harvest.

None of my sons do piecework; none of them do it at harvest. They let some of them do it that can't trust to do a good day's work.

They don't get their full pay till they get to be 19. There's our J——, he's 19, and he gets 8*s.* 6*d.* a week; next time he'll be raised, and will get 9*s.* My eldest boy is the carter; he gets 9*s.* and a house, and his beer allowance; he's 27 or 28, I can't remember which. They get beer for five months, 2*d.* a day the first month, 4*d.* the next three (from June to August), and 2*d.* the last month. Most of the farmers give money now; a little lad will get it according to his wages, so much to the shilling. [N.B.—If A., with 9*s.* a week, gets 4*d.* a day for beer, B., with 2*s.* 3*d.*, will get 1*d.*—E. S.] When he goes a journey, he gets 6*d.* They take it in turns to go. He doesn't gain much by the journey, because the money's for him to spend on the way.

My husband is the shepherd. He has 10*s.* a week and the house, because he works on Sundays. He has 1*l.* at harvest, and 2*l.* at lambing (but he has to buy fuel at lambing, sometimes he doesn't go to bed for a night or two); he has nothing extra for the lambs he saves. If we had to pay rent for a house we shouldn't be so well off, but then my husband has to go to work at all times, early and late. We have no "tailing corn" now; we may have a sack of wheat, but we have to pay market price for it. My husband has to find his own tools, even his shears for clipping; they all have to buy their tools; they say they used to be found; hooks for hay-making were not. I have known our boys lay out 9*s.* in tools.

What potato ground we have is close to the house; it's more than 30 long, but 'taters, 'taters, every year, they don't turn out very much. We can't afford to buy any more potatoes; when our's are out we have to do without them. I have seven at home with me now. Last winter we got but a very little after we'd had our bread. We'd had a bag of flour, we gave 3*l.* for it; that would last about three weeks. Shoes is very dear; our little children's is 7*s.* or 8*s.*, a man's is 12*s.* 6*d.*; one of my boys doesn't wear out above one pair in the year, but they must be proper good ones. I expect they'd wear them right out, and they would'nt last without being soled and mended. That would be when they are shepherds' lads, after that they'd were very much quicker.

We don't have a bit of butchers' meat not for half a year, not from Christmas to Christmas; we sometimes get a bit of mutton at 3*d.* the lb., when a giddy sheep is killed on the farm; it is good when sticked in time; sometimes we buy a bit at Christmas. We have a pig; sometimes we kill, perhaps, two in the year. We live on potatoes, bread, and pig-meat, and are very thankful if we can get a bit of pig-meat; we often sit down to dry bread. For harvest dinner we send out some boiled potatoes, a bit of cabbage, and we put a bit of fat to the potatoes. I don't know that butchers' meat ever goes out to the harvest field. They drink cocoa at harvest. We never have a bit of milk. They used to have what they called chickory, and we drinked a good bit of it. But now it seems to have gone away. In the evening they sit down to what we've got, sometimes a bit of bread; sometimes a bit of bread, cheese, and butter. They are very fond of butter. They drink tea; we give 6*d.* and 8*d.* for a quarter of a pound of tea.

We buy our firewood; we don't have even the carriage given us. Sometimes our wood will come to 2*l.* for the winter. We had it all drawn for a few years, but somehow it is not hauled for any one now. We have to keep up a fire to dry their things at night, sometimes we have to keep it up all the night through. We have wood mostly; we get a little coal through the coal club, I have sometimes got a bit besides. We get our candles at 6*d.* a lb.; in the winter that would last a week, they have to get up by candle light.

We sometimes pay the shoes when we get the lambing money; at the harvest time, we have *that* money for the fuel. The lambing won't pay the shoes; we should want it twice a year for that.

The dearest thing we did have was the bread; we did not have enough with five loaves a day, when I didn't bake. The clothes was not so much. When the lads was little, they hadn't a second jacket; as they got on they give me so much and buy their own clothes.

We have three girls at home, the two eldest do a little "gloving;" I used to try to earn a good bit at "buttoning" when we was first married, but the "gloving" is not so good; if they came to sit at it all day, they might perhaps earn 15*d.* a week. It's a help to buy a little of their clothes, and shoes, and such like. When we used to do "buttoning," and take it down, we used to get it half in money, and half in "truck," as we used to call it; now with the "gloving," we don't have it in this way.

Our third bedroom was put up the summer before last. Before that time, we had only two, and we used all of us to sleep in them; at one time there were 13 or 14 of us. One of them is a tidyish room; in the other the door only opened for you to go in sideways. Downstairs we have only one room with a fireplace, and we have to dry all the wet clothes, and sit there too.

We have one blanket that was given us. We had one that we got from a man who came round; we paid for it by 1*s.* a fortnight, we can't get enough money at one time to buy one.

I have had five sons working at once on the farm, and living at home. The smallest would be getting 2*s.* or 2*s.* 6*d.* a week. When they were all in their best work, I don't suppose we could stand very well if two of them had been ill for a fortnight, even in a good year. We should have to go for help.

My second boy wasn't a good scholar when he was here, he went to work so early. He's gone to a powder magazine to work (at Portsmouth.) He sent for ——— (another son) to come to him too, because he thought he'd be better than he was at the farm. He gets 13*s.* a week, and has to pay for lodging. They don't seem so much better off, but you've no need to work so much, and don't wear out so many clothes. Mr. ——— (the employer) is a very good man, but farm chaps work so hard that they might as soon be "transports." They don't like being "drove about" as they are at farm work; they don't know what sort of work they may be put to. It's slavish work, and I've heard many of the people say they would go away if they could.

One of my sons is gone to America; and there's our Jim, he says he'd be away too, if it wasn't for his bad leg. They like to be good scholars, because it helps them to go away.

11. Statement of the wife of an ordinary labourer.

My husband worked 17 years for one master in the neighbourhood of Bridport before we came here. We have brought up 10 children, and have never had sixpence from the parish. His wages there were 9*s.*, and we had 1*s.* 9*d.* to pay for rent. But we heard it was large farms in this country, and we could all work together, so we came here; that is 13 years ago.

My husband has 8*s.* a week and his cottage and garden. We mayn't keep a pig, but instead of this master gives us 6*d.* a week for the wash. Some of them will let their men have a pig, and trust them till it gets fat, and then take half of it to pay for it, and for the food to fatten it.

Near Bridport we'd have the "gristing" of the farmer, and he'd keep it back out of our wages. He'd charge us the market price for it. Here we pay 1*l.* a sack for flour. We have it ground for 2*s.* Sometimes they let the miller take some of it for grinding. They will take 7lb. out of a bushel. We do not think always that we get the flour back of the corn we sent. We bake our own bread.

Sometimes if anything happens, master 's glad to sell us some of the meat. In the last three years we have got perhaps seven or eight bits in this way. We have bought a bit at Christmas, when the

Dorsetshire.
Mr. Stanhope.
g.

children are here. We buy a little pig meat; we use it with the potatoes; we don't have a dish of pig by itself. At harvest we eat some cheese, but not at any other time. We don't often get potatoes. When we'd 10 at home we couldn't live on the bread we could buy. We'd get a little rice if the potatoes wasn't good. We could make a meal a day off rice. We'd buy a few peas; my husband could never eat barley.

My children never used to drink much tea. I'd mix them a little broth (bread, hot water, pepper, and salt). At harvest and haytime we get money to buy cider.

We can buy wood at 8*s.* the hundred. Mr. —— will give us furze, but we have to cut it.

Clothing's cheaper than it was. We've bought two blankets here; my husband got them at a sale very low. We didn't have none before.

My girls worked in the fields before I got them places; they went out with me. I could go now if I liked. I used to get 8*d.* a day, and if I went out the whole harvest Mr. —— would give me 10*s.* more.

I have three boys at home. The eldest is 19; he's carter, and gets 8*s.* a week. He got this since turnip hoeing. He get's 16*s.* at harvest, and beer. He takes a pair of horses.

The boy of 17 does odd jobs about the farm; he does as much as a man. I suppose he can lift a sack of wheat. He gets 7*s.* He has not had this a twelvemonth. He never has piecework.

My youngest eats as much as his father; he's 10, and gets 3*s.* 6*d.* I never had anything from the parish my whole life. My husband was ill about a fortnight, and the doctor's bill was 7*l.* 1*s.* We paid it by degrees.

PIMPERNE.

Population - 495.

12. *Rev. W. Bury*, rector.—In spite of the prevailing wages here being only 9*s.* a week in money, exclusive of piecework, it is a very prosperous place, as any industrious woman can get a great deal of washing from Blandford to do; therefore I do not think that being required to keep their children rather longer from work would be a hardship here. Boys from 8 to 10 are employed by the farmers, and it is very unusual to keep any boy after 10. I believe that for this parish, which all belongs to Lord Portman, the best plan would be that the farmer should not be allowed to employ a boy till he can read and write, or till he is a certain age. The present results are not satisfactory. Sometimes we have boys of 13 or 14 coming to our night school, and being taught their letters again, because they have forgotten what they learnt. One difficulty now is that the parents have no control over the children when they begin to grow up and earn a little money.

Girls we can keep at school till 12 or 13. There is a little gloving then for them to do, and this rather keeps them away from service.

Almost all the cottages here have been replaced by new ones. Two have been built of wood, the rest of brick and flint, by Lord Portman. The former are certainly very nice, and are very warm and comfortable. The rent is 1*s.* a week. All have small gardens and allotments besides. In the latter ploughing has crept in, and I regret it because it does away with some of the moral effect of these bits of land. Any man who is too busy to attend to his plot, can afford to pay a man to do so for him. The only persons you feel a difficulty about are the widows.

STOURPAINE.

Population - 658.

13. *Rev. R. R. Watts*, vicar.—"Women and girls "are not very regularly employed here in field work, "and all such employment tends to make them "coarse in manners and language, and compel "them to keep the elder children at home to look "after the younger. A few go 'machining' and "'couching,' but the greater number do not work "regularly in the fields. There is a great deal of "knitting and gloving done in the parish, which is a "great hindrance to the school, as the girls are taken "away early to work, even at 10 or 11 years of age. "They work long hours, and get very little profit by "it. Another special hindrance in the case of the "boys is the large quantity of allotment ground. "Many of them are taken away from the school "for weeks at a time to attend to the cultivation of "the allotments, and this makes it very difficult to "maintain anything like uniform progress. The "result is that there is a great deal of ignorance in "the parish. In my Sunday class I find many of the "lads have great difficulty in reading the Bible intelligently, and it is plain that such education is useless, "if not worse. The allotment ground is, however, a "very great benefit, as few of the cottages have "gardens of any size, and is the only means by "which some of the families are able to pay their "rents and supply their household wants. The "wages are lower here than in some of the parishes "round, and in consequence of a good deal of the "cottage property being either lifehold or belonging "to owners of small means who are not particular "about their tenants, this parish is the refuge for "those who are turned adrift from other parishes, "and the result is irregular employment in winter. "A large number of persons are employed in the "neighbouring parishes of Durweston and Bryanston, "because there is not sufficient cottage accommodation there; but for educational purposes, and in "times of sickness, they are thrown upon this parish. "To keep the children away from work till 11 or 12 "years of age would be a great hardship, but I believe "that if some pressure could be put upon the parents "not to let their children be employed till at least "10 years of age, or till they can read and write, they "would easily find the means of doing so. A good "many children are seldom or ever sent to school, "and mainly through bad management and indifference. I don't think that the school payment is any "hindrance.

"The cottages are very bad. Many families have "not more than two bedrooms, some not more than "one. The bedroom accommodation generally is "very bad; it has a demoralizing effect on the young "people. Many of the cottages are let at high rents, "and have no garden or outlet, but there is a gradual improvement where the cottages fall into Lord "Rivers's hands. As I said before, the great evil of "the place is the existence of so many tenements "belonging to owners of small means, who cannot "afford to keep their cottages in good repair, and are "obliged to exact a high rent.

"I do not think that the employment of women "and children in field work is *excessive*, or that the "results are necessarily more demoralizing than home "work. I believe that much evil may be traced to "the *sedentary* life of knitting and gloving. Wages "are low, but there are many advantages which are "received by a steady labouring man which are not "reckoned under the head of wages, and the fact is "certain that many families do manage to live respectably, and to send their children regularly to "school. The great drawbacks of this parish are "the number of out-parishioners driven into it, and "the miserable state of so many of the cottages. I "should wish to see a gentle pressure put upon "parents to send their children more regularly to "school between the ages of 6 and 10, and I think "then much might be done, and this would best be "done voluntarily by the employer of labour; but if "this is impossible, I think some form of certificate that "a child can read intelligibly, and write legibly, might "fairly be required before they were allowed to be "taken into regular employment. Night schools "might then be made much more useful than they "are now, when very often the time is taken up with "teaching the very elements of reading and writing "and arithmetic. At the present moment I have "three big boys who have had to learn their letters

" and spell monosyllables, requiring in consequence " almost the undivided attention of a teacher if they " are to make any progress, and others who might be " making progress are hindered."

WHITECHURCH.

Population - 554.

MILBORNE ST. ANDREW.

Population - 647.

14. *John C. Mansel, Esq.*, Longthorns, Milborne St. Andrew, landowner and magistrate.—In these parishes the boys are usually taken from school at the age of 10 and 11. Indeed, when a boy can earn about 2*s.* 6*d.* or 3*s.* a week, it is hard for the parent to forego such an acquisition to his income. As there is some danger that the boys might forget what they have learnt at school, we endeavour to obviate it by a night school in each parish, and we hope to have a special master at Milborne next year during the winter months; three nights for the adults, and three nights for the boys.

Secondly, we have endeavoured by the establishment of reading rooms in both parishes, to enable the lads to keep up the advantage of their school education. These reading rooms are now firmly established.

As soon as they were started we handed them over to the sole management of the working men, which is in my opinion the secret of their success. At Whitechurch we began in 1864 with 39 members, of whom 10 were real agricultural labourers; now we have 61 out of a population of 554. The average daily attendance in 1867 was 25. At Milborne, which is managed on the same principles, the average was 19 out of a population of 647. In both there are a certain number of honorary members, but now the annual surplus exceeds their subscription, so that the room may be said to be self-supporting.

Among the rules made by themselves is the prohibition of smoking, and of course of drinking beer or spirituous liquors. No rent is paid. Mr. Michel built the rooms in both parishes for this special purpose.

To the men employed in the Whatcombe estate I pay 10*s.* a week. The ordinary rate among the farmers is probably 9*s.* a week. Then they give 1*l.* for harvest and oftentimes piecework (this latter amounts to an average addition of 1*s.* to 2*s.* a week per annum). Some give also 'grist,' or wheat at 5*s.* per bushel, irrespective of the market price. The quantity allowed is in proportion to the working portion of the family, so that a labourer who has a son or more in his master's employment is entitled to more "grist." Beer is also given for certain kinds of labour, such as reaping, mowing, and thrashing, turnip hoeing, &c. &c. Several farmers in this neighbourhood give their men money instead, which is found to have a most favourable result and does away with much excess of drinking. I have adopted this plan, also, as well as giving the men harvest money.

Instead of "grist" I give a quarterly payment varying with the average price of wheat during the previous quarter until it reaches a 5*s.* level.

15. *Mr. Henry Fookes*, farmer, Whitchurch, chairman of Blandford Farmers' Club.—In my village, which is a favoured one, we have some difficulty in getting women to go to work. They are so much wanted for household work, &c. that they do not go to the fields. But in other villages round many more go. In some cases I know farms where 10 or 14 women are employed. Sometimes they go with threshing machines, but on account of the danger I never think this a fit employment.

We never employ girls; boys seldom before 9, unless the father wishes it; and in the winter time we want no boy till he can stand the weather. This would be about 10 or 11 years old, but it all depends whether a family is well off or not, because at task work, such as turnip singling, &c., a father will take very young boys or girls to help him. My weeding is all done by boys from the reformatory which is in my parish. A man from there will bring 30 of them at a time to reap, or tie up oats, or weed. I pay them, taking big and little together, at the rate of 1*d.* per hour. Boys generally start at 2*s.* 6*d.* a week and earn 6*d.* a week more each year. At 15 a good boy is worth 4*s.* 6*d.* a week. We never lodge and board any of them; that custom has quite gone out here.

I think it doubtful how far it is an advantage to have cottages on the farm away from the village. My shepherd complains very much of being one and a half miles away from the school.

We never allow liquor now, and never have the men drunk on the premises. Some farmers give the men a hogshead of cider a year to take home. I give half a hogshead of ale for a harvest of 24 days, or if they prefer not to take it I give them 10*d.* a day.

16. *Miss Kington*, schoolmistress.—The attendance of the girls is much affected by "gloving" and "knitting," and not at all by field work. We allow knitting to be done one day a week in school. I believe that there are no families here that do not send their children a little. Some come three miles from an outlying hamlet and are among the most regular. Indeed, all the children coming from the hamlets are more regular and give less trouble than the girls from the village.

I give lessons to all girls over 12 in the theory of cooking, cleaning a house, and so on. I have not found it possible to teach it them practically, though I tried the plan at Ilfracombe. We had no one to buy what we cooked.

[The girls stayed in some cases till 14 or 15 years old at school. The boys apparently left school by the time they were 10 years of age. There was a separate master for them. At Milborne St. Andrew the mistress said the boys all left before 10. Only three in her school over that age. Girls stayed rather later, but left very early for service.]

STURMINSTER MARSHALL.

17. *The Rev. C. Kegan Paul*, vicar.—"Few boys " stay at the day school after 8." [In November 1868 there were only six of this class over 7.—E. S.] "The " majority begin farm labours at that age, some much " earlier, even at 5 years old.

" Of the five principal employers in this village, " two are giving 10*s.* a week to their labourers, three " are giving 9*s.* a week; the latter give a few advan- " tages. A man on full wages pays his mother 5*s.* a " week for food and lodging, if he lives at home. If " he lives in lodgings, he generally pays about 1*s.* 3*d.* " to 1*s.* 6*d.* a week for lodging, and with washing and " food spends about 6*s.* a week."

The names following are taken at random from the list of those on the books of the night school. All are farm labourers.

[The young men above 17 average only 8*s.* a week. —E. S.]

---

18. In Answer to a Further Inquiry as to Early Employment, Mr. Paul writes, Feb. 2, 1869.

1. There is at present no boy in my school above the age of 9, except under exceptional circumstances. The four who are above that age are (1,) the son of a gamekeeper who has no other children ; (2,) a cripple ; (3,) grandson of a carpenter who has adopted him ; (4,) a servant of an old lady who sends him half time.

2. I take my list of candidates at the last confirmation, and find that 17 candidates (sons of labourers, and labourers themselves) were all unable to read tolerably, having all gone to work at ages varying from six to nine years. Only one of those, who was a labourer's son, had stayed till he was 10. The 17 were my only candidates from the strictly labouring class.

3. I have to day called at five labourers' cottages who are average specimens. I have avoided calling at those which I knew were exceptional cases, either from great poverty or great carelessness, and as I walked through the village, took the fairest I could select.

The result is as follows, the facts being given me by the mothers :—

Names.	*Ages at which they began regular work.*
Singleton, John -	- 8
,, Charles -	- 8
,, William -	- 9
,, Arthur -	- 9

The father is a carter and they *wish* to keep the children at school; Willie and Arthur were kept at my earnest advice against pressure from the master, but the parents were at last obliged to give in.

James, Harry - - - 5

Son of a shepherd, he has never been at school, is *regularly* with his father in all weathers, and has been so all the winter ; he is sharp and useful, and will not be six till next August ; he is the eldest child of this family.

Henley, William - - 10
,, George - - 10

The husband, though a labourer, has at odd times acted as groom, and has usually earned higher wages than the average ; the mother an exceptionally tidy active woman.

Carter, Fred - - - 5
,, Harry - - 7

The mother made a sort of excuse for not having sent Harry to work earlier, because he was delicate, and had such a bad stammer.

Courage, George - - 10
,, William - - 8
,, Charles - - 9
,, Eli - - - 7

The elder of these boys was kept at school longer than he would have been at the persuasion of the curate. He was an exceptionally good, painstaking, clever boy, is now 21, and has quite risen out of the labourer class, as have Charles and Eli to some extent, both of whom, as George, have left the parish.

The two children of 5 I have specified are by no means the only ones who have been working since that age. But I think these four cases fairly represent the state of the case.

You will understand I have given the age at the commencement of *continuous* work ; nearly all these boys had previously led horses in the hay and harvest time.

19. The following passage is from an article in the Theological Review (Jan. 1868) by the Rev. C. K. Paul.

The children are removed from school by a pressure their parents are unable to resist, at the very time when first their teaching becomes useful to them. Wages are so low, that a man with children above 8 years old is glad of the few shillings which may be earned by them, and the employer of labour insists on these boys being sent into the fields, even if the parents would willingly make an effort to keep them at school. The farmer finds it pays him well to get two boys who, under a man, will do a man's work, but whose combined work costs less than an able-bodied man's wages.

And the boys so hurried off to the fields soon forget the little they have learned at school. We have known many lads, not without intelligence, attending a night school when they reached the age of 16 who have had to take up again their learning almost where it was begun at the age of 6. The want of use, and hard drudgery, in early years, have blotted out all that had been acquired between the ages of 6 and 9.

Night and Sunday schools are but inadequate palliatives of a system which keeps the child of the average labourer in a state of crass ignorance to minister to sordid greed.

MILTON ABBAS.

Population - 1,014.

20. *Rev. R. Roberts*, vicar. — We never reckon on keeping the boys at school here much after 9. We think we do well if we can. Many farmers hire their men in consequence of their large families, and then very young boys must go to work. Some of 7 or 8 "keep" horses in a field during the late spring and summer. You see boys of the same age constantly employed with horses. In hay harvest you see them leading a waggon with two horses in narrow lanes and under circumstances where it seems scarcely safe to trust such young lads ; I never remember any accidents to have occurred, nevertheless.

My night school was started 25 years ago at the request of some of the young men of the village, and among the 60 scholars who then attended nearly one-third were married men. I do not think that men of that age would be likely to attend to the same extent when the night school is conducted by the schoolmaster alone. I look to the night school as the great means of keeping up education.

The number of boys and lads employed on our farms amounts to 30 or 35. 12 women and grown-up girls work all the year in the fields.

Glove-making with machines was introduced here by Baron Hambro' 16 years ago, but he does not consider it has answered his expectations, nor is the remuneration at all adequate to the labour, which, from the posture required by the machine, is both irksome and fatiguing. Another objection is that it keeps young women at home, and these marrying early have generally large families, and thus add unnecessarily to a population which, it so happens, has doubled itself in 60 years. Twenty years ago the staple trade of this place and the dis-

trict was the manufacture of thread buttons, to the great injury of the young people thus employed.

The system of letting cottages with the farms is open to abuse by placing the poor man too completely at the mercy of his employer. I have known very hard cases result from it. Some of them are built on the farms, where most of those recently erected are situate; but there are not sufficient for the labour, and in two or three parts of the parish the men have two miles to go backward and forward.

Fuel is so scarce here that the families, as a rule, never have a fire except at mealtimes, even in the depth of winter; one of the evils arising from this is that the poor people have difficulty in drying their clothes when they come in wet. I have known instances in which they have had to put them on next day just as wet as when they took them off. Shepherds and carters suffer much in this respect, the former especially, as it is a rule with them that the worse the weather the harder the work. Their diet is bread, cheese, and potatoes, with a little bacon in the families that are best off. But for the last few years pigs have not been so common, owing to the high price of barley and the greater scarcity of potatoes.

LANGTON.

Population - 174.

21. *Mr. Meikle, Jun,* assistant bailiff to J. J. Farquharson, Esq.—For an arable farm here four men or less are required for every 100 acres. Almost every farmer has a woman or two occasionally to "hoe" and "hack" turnips, or on the machines at threshing. It is very doubtful whether a woman with a family gains much by going, and the fields are not the place for any woman, young or old.

Men are regularly employed here; very few men are out of work in bad weather. They would earn 10*s.* a week in money regularly, besides one month of harvest work at 15*s.* a week and two or three months of other piecework. Each man has 15 "lug" of potato ground for nothing; each has 1½ pints of beer a day, and more at harvest. Most farmers hereabouts give it only at harvest and at threshing. A great many farmers are no longer giving it as they used. There is no comparison, to my mind, between the educated and uneducated labourer. The latter goes on well for a time in an ordinary way, but if anything unusual happens they are completely put out. The best security for keeping our labourers, and for preventing them from striking and giving trouble, is a good cottage and garden.

Men and boys work from six to six, with two hours for dinner and quarter of an hour for breakfast. The carters and the boys who go with horses stay later to feed their horses at night. Women work from eight to six, with an hour for dinner.

TARRANT HINTON.

Population - 253.

22. Notes of conversation with *Rev. C. D. Saunders,* rector, *Mr. George Hill,* farmer.—"Women work a "great deal. Some would work five days out of six "all the year. Some of them are very skilful reapers. "Young girls very seldom go.

"Boys work at 10 or 11 year old, but not regularly. "They begin with minding birds."

Mr. Hill has no doubt of the advantage of education to a labourer, if it is not carried too far.

Rev. C. D. Saunders says, "that the rule has "always been, if you come to school at all you shall "come regularly. This plan has answered, and he "does not think that there are any children in the "parish not attending school. The children come "here also from Gunville, where there is no school "except a dame's school."

THE DORCHESTER DISTRICT.

23. *Mr. W. Swatridge,* miller and corn dealer, Maiden Newton.—The usual mode of hiring a man hereabout is to make a condition with him that his wife or a daughter shall go to work, and his sons as they get old enough to go. One effect of this is the reduction of the father's wages, which are made up by the employment of his family. He, of course, is anxious to push off his son at 7 years old, or as soon as he can, to plough, and the farmer is quite ready to get the cheaper labour which he has thus the means of getting. As the boys grow up they go on living at home, but although they are doing men's work, the employment of the whole family lessens their earnings also, and they do not get man's pay. A farmer does not care to hire a single man. The wives go out at 6*d.* and 7*d.* a day if they work regularly. Sometimes, if a family does not get gristing, 2*d.* extra per day will be paid to her. It would be much better for the comfort of her home if she did not go to work, especially as she does a great deal of work fit for a man to do, and at which he could do no more than she does.

The worst work they do is hacking turnips and cutting them up for the sheep, which they do in cold and wintry weather.

Boys ought not to work before 10 years old, especially at ploughing. Not only do I complain of their loss of education, but also of the physical injury done to them. Boys of 7 and 8 go to plough. A boy of this sort gets up with his father at 4 or 5, has to help to prepare and feed the horses, walks from 6 till 2, except a little halt for meals, then comes home to dinner, and returns to feed the horses. I see the effect of this early work in making the boys bowlegged.

There are no bad cottages here; but in the villages round there are plenty. One of the great evils is the way in which the old people are kept at home in a cottage already overcrowded with children, to the injury of the health of the people living in it.

Wages generally paid fortnightly, sometimes monthly. Then advances would be made and the account balanced at the end of the month. But by this system the labourer is the sufferer, because he has to pay for his credit at the shop.

[On the subject of hiring families, Mr. Levi Groves, of Knighton, says—"When I hire a family the boys "are shown to me, and I see whether they are big "enough for my purpose." Mr. Symes and Mr. J. A. Smith, of Bradford Peverell, say—"When we hire a "man we look out for a family suitable to the farm, "the condition being that all shall go out when "required."—E.S.]

24. *Mr. J. Brown,* schoolmaster.—"The poorest "of the labouring class frequently send their boys to "work under 8, sometimes under 7 years of age. The "result is that their education is very defective, in "proof of which I give two facts:—

"(*a.*) In my school, which (when I made this "calculation about a year ago) contained 167 children, "61 of these were children of agricultural labourers. "The three upper classes contained 48 children, but "only five of these were children of agricultural "labourers, and four out of these five were girls. So "you see it is quite an exception for children of this "class to remain at school long enough to obtain any "really useful education.

"(*b.*) On comparing young men at our evening "school with each other it is often difficult to see any "difference in attainments *between those who have* "*attended a day school and those who have not.*"

FORDINGTON.

25. *Rev. H. Moule.*—"*Girls* under 16 or 17 years of "age are rarely employed in Fordington field; occa- "sionally in the spring a few are hired for weeding. "*Boys* are taken from the day-school for the same "purpose. Those brought up to the plough generally "commence at 8 years of age. In some parishes

Dorsetshire.

Mr. Stanhope.

g.

" they have commenced as early as at 7 years of " age.

" Women are employed in the barn, in the field, " and at the thrashing machine. The evils arising " from the employment of women and children in " agriculture are in this part of England less than in " some other parts, and far less than those attendant " on their employment in many branches of manufac- " ture. Yet, and especially in a parish like Fording- " ton, forming the suburb of a small town, their cure " or relief is far more difficult than those existing in " manufacturing towns.

" This increased difficulty arises mainly from the " smallness of the income of the agricultural labourer " compared with that of the manufacturing operative ; " which of itself renders it necessary (and the more " necessary in proportion to the number of young " children) that advantage should be taken of any " help which the wife, or which any of the children, " may afford to add to that income. This facilitates " the practice, so unfair to the agricultural labourer, " *of hiring not the man alone, but his wife and* " *family also ;* so that whilst he continues in the " employ of his master, his wife and any boys old " enough must work when required.

" I. Let the case of a woman under such circum- " stances be regarded in connexion with the education " of children, say of girls. Suppose her to have four " or five children, one of them a girl 7 or 8 years " old. The mother is required to go to the barn, the " field, or the thrashing machine. The elder girl " must then be kept from school to take care of the " younger children, perhaps one of them a sucking " infant. What legislation can touch cases of this " kind ? And how can the very imperfect instruction " of such a girl, or the entire loss of all instruction, " excepting that which she may get in the Sunday " school, be prevented ? For the general order of " proceeding is this : the child having been so em- " ployed for a year or two at home enters service in " the family of a mechanic perhaps, or smaller trades- " man, as nurse-girl, serving either for her food, or " for 1*s.* 6*d.* or for 1*s.* a week.

" II. As to the early employment of boys. The " wages of a farm labourer in this parish may be 10*s.* " a week ; out of which, however, for his cottage, " with little or no garden, he may have to pay 2*s.* or " 2*s.* 6*d.* a week. He may have 4, 5, or 6 children, " and amongst them a boy of 8 years of age. The " farmer requires this boy to go to work, and offers " 2*s.* a week for that work. And although the boy " has to leave his school, and although he may have " to rise at 5.30 a.m., and work until 5 p.m., and " although if at plough he may have to walk 11 miles " a day for his 2*s.* a week, the father cannot refuse " for the sake of the so-called education of his child " the addition of 20 or 25 per cent. to the income of " the whole family, even though earned at such a sort " of labour. And can any legislation compel him to " refuse it ? Even for a mechanic with a large family, " and with wages amounting to 16*s.*, 18*s.*, or 21*s.* a " week, and having to pay as here he has 3*s.* or 4*s.* " a week for anything like a decent dwelling, it is " difficult to refuse to let a son earn 2*s.* or 2*s.* 6*d.* a " week, either as errand boy or as plough boy. The " money spent on liquor may sometimes occasion or " increase this difficulty. But no attempt *to educate* " the children of the operative classes in such a " locality as this can be of any avail, which is not " preceded or at least accompanied by thoroughly " practical business-like and philanthropic efforts to " improve *the dwellings* of the parents, and with this " their *social condition.*

" III. The case of out-door pauper children calls " for special consideration. Mr. Moule has known " pauper widows bring up large families without a " day's schooling for any one child. The guardians " may *insist* on the children attending some school. " But who is to enforce their requirements ? He " never knew a relieving officer attempt to do it. " And if he did what must be the result ? How can " a widow out of 1*s.* 6*d.* a week and a loaf, the child's " allowance, afford to pay 2*d.* for the week's school- " ing of each child ? And if the child, whether boy " or girl, can by some casual employment add a penny " or two to the 1*s.* 6*d.*, is it any wonder that the " mother should for the sake of this keep it at " home ?

" IV. The experience of 45 years in two large " agricultural parishes, combined with no slight " acquaintance with large manufacturing towns, con- " vinces Mr. Moule that a people can be no more " *educated* than they can be made *religious* by any " *act of legislation.* The evils of the present want " of education are enormous ; but they are too " deeply seated to be touched by such means. By " nothing will they be effectually relieved, but by a " *general, serious, kind, and thoroughly practical* " *drawing of the upper and middle classes of society* " *towards the lower.* Sunday schools conducted by " voluntary teachers of true piety, and night schools " conducted in the same way, notwithstanding their " many deficiencies, have within Mr. Moule's range " of observation done far more for the *true education* " *of the working classes than day-schools. True* " *Christian principle* fairly carried out *by numbers* " would thoroughly educate the people. Nothing " without this can do it.

" Henry Moule."

PIDDLEHINTON.

Population - 414.

26. *Rev. T. H. Roper*, rector.—Out of 76 children attending this school, only 12 sons of agricultural labourers (and four of a rather higher class) are over 6 years of age, and only three out of these are 8 ; two of the three are attending very irregularly from field work.

As a comparison, 40 of the girls are over 6 ; and, as a rule, they will stop till 13, though they get a little irregular the last year or two.

Most farmers here hire their men at the annual hiring in February. The wife is bound to go out to work when required, or in her place one of her girls. " Couching," " spitting " (spudding) thistles, and weeding is done in this way, but rarely by girls under 14. Some, however, younger than this go to pig-keeping after harvest, or to bird-keeping. The boys are also bound to go when required, but as they are better paid in proportion than the men, it makes a great addition to the family earnings.

But by this system of hiring, the children in the school change every year, and leave generally betweeen two examinations. Could not attendance at the school in one parish count towards the Government grant, by being added to that in the parish to which the family removes ?

The boys leaving these at 8 years old, no assistance is given by Government towards teaching them in a night school until they are 12. During the intermediate years they must learn nothing, or a night school must somehow be provided for them.

PIDDLETOWN.

27. *Mr. Collins*, schoolmaster, also complains " of " the yearly hiring system, by which we get a totally " new set of children every year. Our maxim is " that a boy loses six months by change of school."

PIDDLETRENTHIDE.

Population - 793.

28. *Miss Gregory*, schoolmistress.—" I lose some of " the boys between 6 and 7 years of age altogether ; " most of them leave between 8 and 9. I don't " think I have any above 9. Now and then the " younger ones come back in the winter after pig- " keeping. Scarcely any of them stay the whole " year, what with potato picking and apple gathering.

A great many leave after they have passed Standard I.

"Girls are taken away for pig and bird keeping, sometimes about 8 or 9 years old. But few of them go unless their fathers live on the farms. Few girls stay after they are 10 or 11."

STINSFORD.

Population - 357.

29. EXTRACT from Notes of Conversation with the Rev. A. G. S. Shirley, vicar, and Mr. T. Lock, farmer. November 11.

About 11 adult women go to work in this parish. The only way they can be got to go is by making it a condition of hiring the husband that they should go. They get 6*d.* a day, or 8*d.* if they don't get "grist." Mr. Lock is the only farmer in the parish who gives grist. Boys leave school for regular employment at 8 or 9 years of age. Owing to the turnip cultivation they are more wanted in winter than in summer.

CERNE ABBAS.

Population - 1,185.

30. Notes of Conversation with Rev. A. H. Bull, vicar, and Mr. W. Beach, clerk to the Board of Guardians.

We hardly keep any boys in the school over 9; many leave at 8. Girls will stay till 11 or 12 years of age.

Mr. Beach is surprised at the very low state of education in spite of the means afforded.

Girls are sometimes employed after harvest a little, but as a rule they do not work. Women work on every farm, and during a great part of the year.

THE HEATH DISTRICT.

BERE REGIS.

Population - 1,400 (?).

31. *Rev. Francis Warre*, vicar.—"Acreage of parish, including the outlying districts of Hyde, and Milburn Stileham, 6,848; of which 3,453 are cultivated in farms varying from 50 to 700 acres, 1,745 by tenants in pieces under 50 acres.

"The state of cottages in this parish is very bad. They are built of thatch and mud, and many of them are miserable tenements; the rent is high, and instances of crowding very frequent. They have open chimney corners, no grates, and smoky and unwhitewashed rooms. The bedrooms are low, without a fireplace, or sufficient accommodation for families. There are, however, good hopes that some alteration may be made in the present bad state of things by the chief landowner in the parish, who has not until lately become personally acquainted with the state of the property.

"There are in the parish, excluding Hyde and Milburn Stileham, 135 houses inhabited by the labouring class, of which there are—

—	Having One Bedroom.	Having Two Bedrooms.	Having Three Bedrooms.	TOTAL.
Inhabited by persons with families.	33	64	9	106
Inhabited by old persons and without families.	17	11	1	29

"The education of the poor has been until lately neglected in this parish. We now suffer greatly from want of school accommodation. Our schools are small and scattered. We have three small schools, (1) a girls' (mixed), under Government; (2) an infant; and (3) a boys' school, besides (4) a school in a district three and a half miles off, several infant dames' schools, and a dissenting dames' school. In the two first only is the teaching up to the standard of the Revised Code, and these are nearly half a mile from each other. Nos. (1), (4) are supported by the landowners, on whose property they are built; (3) has a small but inadequate endowment. The rest of the expenses, including that of the night school, falls chiefly upon the clergyman. He is able to collect about 5*l.* from the farmers in the parish.

"The annexed table will show pretty correctly the number of 'labouring' children at school or work.

LABOURERS' CHILDREN.

—		Boys.	Girls.
Between 6 and 13		71	83
(1.) On Register of Schools	Under 10	24	50
	Over 10	11	18
(2.) At work	Under 10	7	—
	Over 10	8	—
(3.) Neither at school nor work	Under 10	8	11
	Over 10	3	4

[*Note.*—This table is made from a correct census of the parish, and therefore includes both dissenters' and church schools; but of course in a large and scattered parish (eight miles by five) changes are continually taking place.]

"A successful night school has been kept in this parish for now three winters.

"Last winter the attendance averaged 35. The number on the books were—

Below 12 - -	9
Above 12 - -	28
Total	37

"Of these, as far as can be ascertained, 15 had never attended any day school.

"The first year the greater part of the boys could neither read nor write. The lowest was the largest class, and of them five could not even repeat the Lord's Prayer; few could even now repeat the Belief.

"The largest class is now the first. They can read an easy story, and write copies in small hand. Six of them might be able to indite a letter to their friends. I cannot be sure whether they would be able to direct it legibly. Ten would be able to read a story for their own amusement, 16 could do an easy sum in addition, eight could add money.

"The very regular attendance is partly owing to the successful management of the classes, partly to a club held in connexion with the school, the subscription being a penny per week, but if any boy was absent for a week (*three* times running), a penny was taken off his former subscription.

"These night schools supply a real want in neglected places, although they may fall off after a time. Short lessons, strict order, and a popular mode of teaching are the secret of their success.

"Great credit is in this instance due to Mr. Hallett, the relieving officer of the district, for his most efficient help, kindly and constantly given. The expense almost entirely falls upon the clergyman. It is certainly to be regretted that where, owing to our poverty, we are unable to support a certificated master, the Government should not find means to extend the principle of 'payment for results' to night schools of this kind.

"I have made some enquiries into the state of education of married poor in two outlying districts.

Dorsetshire.

Mr. Stanhope.

"'Reading' means in this case to be able to make "out more or less imperfectly an easy chapter in the "Bible.

"'Writing' means little more than being able to "sign their own names.

"But of course such a statement, taken from the "people's own account of their acquirements, can be "only relied upon as approximately true.

"I have looked at the marriage register of the "labourers married in the church during the past six "years, and I find there signed their names—

Men - - - - 27
Women - - - 43

Could not sign their names—

Men - - - - 39
Women - - - 23

"There are in this parish of about 1,400 people, "four public-houses for sale of spirits, and three beer-"shops. Those in the village are the best conducted. "A beershop or public-house in an out-of-the-way "place is sure to have a bad name.

"There is not much actual intoxication among the "labourers, except at harvest, club times, and other "occasions; they cannot afford it. The publicans "say that they do not encourage drunkenness. A "drunken man drives away the sober customers, and "gives the house a bad name. There are twice as "many 'houses' in this parish as are necessary for "either the good of trade or convenience of the "people. Excessive competition in the trade leads "to the increase of drunkenness. The half drunken "man when turned out of one house goes to another; "and it is much to the credit of the respectable "landlords that they have the sense in most instances "to discourage the practice of admitting them as "much as they do. But on the other hand it may "be said that where each house is not overcrowded, "and the men have the choice of their company, "there is less likelihood of brawls and quarrels. The "system of granting licences to beershops through the "excise is bad. The officer grants the licence with-"out any inquiry into the character of the applicants, "and the power should be transferred to the magis-"trates.

"The beershops do not make a livelihood out of the "business. Those who keep them depend chiefly on "other occupations. One is a shoemaker, another "bakes, a third is a carter. Notwithstanding the "alleged decrease of drunkenness, there can be no "doubt of how much poverty and misery the 'drink-"ing' habits of the people are still the cause. Un-"happily the labourer lives in circumstances in which "social comfort is in most instances impossible. He "looks to the public-house for society; his club is "held there; there is no other place, except in the "corner of the street, in which he can meet his friends "or hear the news. And so it is not surprising that "he catches the custom, and 'drinks' more from the "love of company and excitement, than from the love "of beer.

"The system of giving credit to the poor is a cause "of much distress to them, and often loss to the "tradesmen. It has been practised to an extent by "the shopkeepers in this place, recourse being had "to the county court in the event of non-payment "within a stated time. The plan seems to have "failed, especially in the case of the 'moveable' "families, who have gone away at the end of the year "considerably in debt. The grocers would gladly "return to a ready money system, but to do so is not "always possible. The poor are nearly all in debt, "and they have no means of getting out of it. The "least reverse throws them farther behind. It is not "the custom of the farmers to settle with their men "oftener than once a month or fortnight. The men "draw money on account, by which when the time "comes the balance due to meet the bill of the wants "of the family for the time is rarely sufficient. A "balance is left unpaid, which is either allowed by the "tradesman to go on, or else the account is closed, "and the money has to be paid off, while another "debt is being incurred at a fresh shop.

"The hiring of farm labourers at Statute fairs is a "great social evil in Dorsetshire. It has helped to "demoralize a large class of the labouring population. "Those who go to the fairs to be hired, seldom stay in "a place more than a year. They 'rove' from one "parish to another, leaving the shops in debt behind "them; have little furniture, or idea of domestic com-"fort. They have generally large families growing up "without control, as they never stop long enough in "a place to come under the same moral influences as "the resident poor. The farmers dislike them, but "do not know how to do away with the custom. "'The men fall back upon the terms of the agree-"'ment and are uncivil and disobliging.' But they "fear the men's deserting them at busy times when "they could not find other men disengaged.

"If Statute hiring is to be abolished it must be so "by the Legislature; in which case the labour market "would be open at all times, and it remains to be "proved that under these conditions it would be more "difficult for a farmer to supply the place of a carter "or a shepherd, than it is for a gentleman to find his "coachman or gardener.

"I am quite sure that the labourer, if once he finds "a comfortable home, and a kind master, will never "seek change for change's sake. Of all men in the "world he is naturally the most stay-at-home.

"Farmers dread the word 'emigration.' They "think they would lose by it their best men. But "with better and sufficient cottages there need be no "fear that a sufficient supply of able-bodied labour "would not be forthcoming. It is the want of a house "that often drives away the young, or, if he marries "without one, keeps him in a state of dissatisfaction. "The decrease of the population in this parish is "owing to the badness and ruin of cottages, and to "nothing else.

"The bearing of the present system of relief and "workhouse life upon the moral condition of the poor "deserves attention.

"One never hears now what was six years ago "frequently said to me 'I brought up a large "'family and never troubled the parish in my life.'

"The poor are every day coming to look upon "relief as their right. As soon as they are sick they "apply for the 'doctor.' It has been said to me as "an argument against joining a benefit club, 'they "'didn't see why they should screen the parish;' "and this is a common feeling among them. That "is the danger by the very perfection of the admini-"stration of relief, of increasing the improvidence "and undermining the independence of the poor. "The workhouse itself is a nursery of pauperism; "What can be expected from children brought up "under such conditions? There is a dejected, "thriftless look about a workhouse child. If the "authorities could give the after history and cir-"cumstances of these children, it would be an "instructive return.

"Women that have fallen, are not relieved out of "the 'house;' this rule is perhaps, as a regulation, a "good one, but it is attended with this evil,—it "collects the corrupted into a class, sufficient to make "fresh comers of the same kind worse, to taint all "that take refuge in the house. These girls have

" little or no chance of marrying (as those of the same " character generally do that remain out of the house). " They are allowed to visit their friends at times, and " they not unfrequently return to the house to be " confined again.

" The labourer of this country is on the whole, " perhaps, improving in his condition. He has better " employment, more means of education, greater " independence than he had formerly. He has shared " in the general advance of society, but there is still " in his state much to be desired.

" He is miserably housed.

" He is under-fed. He seldom touches any fresh " meat. The wives do not know how to cook it, and " if they did, they have not the means of doing so. " Even their supply in the necessaries of life is some- " times insufficient.

" '900 loaves were last Christmas distributed in this " 'parish to 130 families. I made inquiries and " 'found that it was almost entirely properly con- " 'sumed; and yet, sir, it made but a little impression " 'upon their usual weekly demand. I drew from the " 'fact the conclusion that the poor were at that time " 'under-fed.'—(From a baker.)

" He is improvident and ignorant. In the begin- " ning of life, and before marriage, he has more than " is necessary for his wants; he never thinks of " saving.

" His school days are short, and his opportunity of " keeping the little he has learnt there, or picked up " afterwards, so slight that he forgets the greater part " of what was taught him, although the moral train- " ing of a good school may leave a lasting impression " on his character. Every clergyman knows the " great general effect for good that an efficient school " has upon a parish.

" But to insist solely on education, and to insist " upon it, especially in a compulsory form, as the lever " by which the condition of the poor is to be raised, " seems to me to misunderstand the real state of their " case.

" One has only to see the bad inscriptions on walls " and even in the pews in church, to reflect that ele- " mentary knowledge will not improve a mind tainted " in other ways with evil. It may only give it " greater means of expressing and developing its " wickedness.

" Along with education must go other advantages, " and these are to be sought partly from an improved " legislation in those matters which concern his in- " terests, chiefly in the improvement of his dwelling, " and in a great measure in the growth of a kindlier " feeling and sympathy toward him on the part of " landowners and employers."

32. *F. D. Lys, Esq*, Medical Officer to Union, Bere Regis. — After a long experience of an agricultural district, I am of opinion that boys do not suffer any injury from the early age at which they are employed, which, in some cases, is 6 or 7 years. It is rare to find affections of the hip or spinal complaints among them, which you would expect to result from overwork. Flat feet are not common, though there is a great awkwardness of gait among them, owing to the clumsy boots which they wear. Rheumatism is prevalent, but not in any special degree among boys, nor, as far as I can see, is it due to early exposure.

Girls work little when young. In many cases, however, farmers will not allow a father to send them into service, but require them to be kept at home to do field work. Knitting too keeps them at home. The result of this seems to me to be almost a complete ignorance of cooking and the ordinary domestic duties. The difference in the comfort of a house where the wife has been in domestic service and another where she has remained at home is very marked, and I believe want of home comfort often send the husband to the tavern. Give them all the materials for good food, and they cannot make use of them. Morally, I see very great harm resulting from girls going to field work. It is a bad school for them.

They are badly off, but the constant application for the parish doctor, or for parish relief, are no certain test of poverty. There is no such independent spirit about them as would lead them to refuse such aid, and many in good circumstances are not ashamed to receive it.

The windows in cottages should be larger, and should be made to open.

33. *Mr. Scutt*, farmer, Bere.—I employ women all the summer and almost every open day in winter. It is two miles to my farm, on which I have two cottages. My labour goes from here. The women hired start from here at 8 and leave work at 5. As for the boys you can't get them to start before the men when they're bird-keeping. They go at 6. I take a boy of 7 or 8 for this work, but don't want him at all times. The younger you take them the sooner they get useful. They would be better if they could be a little better educated.

Owing to my farm lying wide, have difficulty with my labourers. They wish to leave off work earlier. Sometimes if you are short of cottages you make it a condition with a man that all his family shall go out to work when you want them.

34. *Mr. Chas. Besent*, farmer, Bere.—I employ a few women. Young girls go too sometimes. When a family lives on a farm they are all expected to go out, but girls who go to work seldom are any use afterwards for indoor work. Boys of 7 or 8 often get regular work here. They keep birds and go a little with horses. I should try to find them work. I have one boy 7 years old. He goes to night school, but his father has seven children and all youngsters, and he says he would have liked him to have had more day schooling, but he did not know how he could keep him away from work longer. I find the advantage of an educated man in every way. I don't come across many men that are.

I seldom change my men. I try to impress upon them that we ought to consult each others interests. I had an agreement with my carter for six months, as I knew he was a rough character. After that expired we never have thought about making another. My men don't leave me in turnip hoeing. I never have occasion to hire at the fair.

I pay weekly. It is more trouble, but the men like it better. I think any other night than Saturday the better pay time.

35. Extract from Return sent in by the Rev. J. M. Truman, Incumbent of Woodlands, near Wimborne.

This parish (population 495) scarcely presents a fair specimen of an agricultural district, inasmuch as—

(1.) By far the larger number of the cottages are lifeholds, and in no way connected with the farms, their occupiers being to a great extent independent, and only engaging themselves to the farmers for occasional long seasons, such as harvesting, turnip hoeing, &c., being as they are here styled "strappers."

(2.) A considerable portion of the parish is covered with coppice wood, which furnishes the main winter employment of a large number of cottages.

(3.) Their children are also employed by them (and not by the farmers) in various employments connected with the wood. The farmers employ only two boys between 8 and 10, six between 10 and 13, and 12 between 13 and 18. Total 20. But I can reckon at least 30 or 40 others who are occupied with such work as I have described throughout the greater part of the year, only being (like their fathers) hired by the farmers at busy seasons. 15 women are employed, three of whom are unmarried. The greater number of cottages are held by copy of court roll, or on leases for 99 years determinable on lives; others are built on the waste, for which a nominal rent is paid. The accommodation in these is in many cases very insufficient. They have not all privies. The other cottages generally are in good condition, and

Dorsetshire.
Mr. Stanhope.
g.

sufficiently commodious. The great difficulty in the way of education is the low standard of wages, more especially as it obliges parents to remove their children from school at a very early age, and before it is possible that they can acquire anything beyond the very first rudiments. This too is the great reason why there is such a general cry for labourers, from the fact that those young persons who, through the assistance of a night school or in other ways *have* succeeded in obtaining a moderate education, invariably look elsewhere for more remunerative employment.

Nine is probably the outside age for boys to remain at school.

At least two-thirds of those attending the evening school (59 on books) cannot write correctly or in a legible hand without the assistance of a copy, and the same may be said of about one-half the female scholars. This probably may be taken as a fair representation of the parish in general as respects young persons of both sexes. A very small proportion of them, certainly not more than one in 12, can neither read nor write.

One means of facilitating education for boys would be a requirement that the hours of work for those below a certain age (say 15) shall be in some measure curtailed, at least during the winter half of the year. This would be a great boon to those who have to walk some distance to their work or to the night school.

36. Extract from Letters from the Hon. and Rev. Walter Ponsonby, Vicar of Great Canford, dated December 29, 1868, and January 8, 1869.

About two-thirds of the parish is heath land, patches of which are under cultivation, and are occupied by small holders of from three to 20 acres, which are tilled by the mother and children, while the father goes out to work. I can say no more of these than that there are no children more difficult to get to school, or more unmanageable when there, than the children (both boys and girls) of these small holders.

The other third of the parish is fairly agricultural, and divided into large farms of 300 to 800 acres.

On these young *girls* are scarcely ever employed. *Women* are employed on them in small parties of three or four on such works as weed hoeing, barn work, milking, chopping turnips, attending the threshing machine, &c. It will be observed that none of these works are continuous, and the amount to be done varies on different farms according to the system. The women employed are the wives and daughters of the regular labourers living in cottages on the farms, and it is part of the master's agreement with them that the women should go out when required. They are generally treated well. The strong women thrive on work, and are very healthy. They stay at home on Saturdays to do the house work. I have seen women out at work within a fortnight of their confinement, and out again in six weeks after it, one of the children bringing the baby to the field at stated times to be nursed by its mother. I cannot say that as far as I know the morals of those who go out are worse than of those who do not. There are good and bad amongst all. Exercise and constant employment produce good health, and this we all know tends to good morals.

In my opinion, circumstanced as we are, it would be injurious alike to the employers and the employed to interfere by legislation with the employment of women on the farms.

Boys under 10 are never employed on our farms except at harvest, and when the father takes a piece of task work. They attend school, though irregularly. Three or four boys of from 10 to 15 years of age are employed on every large farm. This work is pig, cow, and bird keeping, stables, &c. Their home is usually in or near the farm. As their work goes on every day alike, few of them attend either church or school, and as they are tired at night I find it impossible for them to come any distance to a night school; the young men of 17 or 18 are more willing and able to do so. Most of the boys try and learn at home; and I do not think I could find a boy of 14 who cannot read more or less. The plan I have adopted lately has been to give a spelling and copybook to any boy who asks for them, and I have several who bring me their copybooks for inspection. I could point to at least 10 cottages where the boys would be found reading or writing almost every night.

I consider that the parents could ill-dispense with the boys' earnings, wages being very low here. The boys are kept out of mischief when at work, and they never make good industrious workmen unless early trained and inured to work.

37. *Rev. J. H. Carnegie*, vicar of Cranborne.—Cranborne proper contains a population of about 1,000, of whom 750 are concentrated close at hand.

Few girls go to field work before they are 16. When taken from school young it is to nurse, so that the mother may go out to work.

Boys are taken away earlier from school than they used to be. Boys who go to help a shepherd leave us about 7 years old, carter boys go at 8 or 9; but they go away earlier to "bird-keeping," returning to us in the winter.

I don't see any disinclination on the part of the parents to send their children. I only know two families with whom nothing can be done in this respect.

Some men work at a distance; two might go three and two a distance of two miles. One or two men would have one mile to go.

Gardens are deficient, but all who want them have allotments. Each has about 20 "lug" in potatoes and 20 in wheat or barley. The allotments cannot be worth less than 1*s.* 6*d.* or 2*s.* a week to them all the year. They never work for hire after 5, so they can cultivate their allotments after that. They never fail to pay their rent for them.

38. *Mr. T. J. Turnbull*, steward to Lord Shaftesbury, St. Giles, adds—"Boys go as early as 6 or 7 " years old sometimes to work. I do not approve it, " partly because of the danger of being trampled on " by horses. But I do not know of accidents. It " would be better for the men if they were not so " much employed."

WINFRITH NEWBURGH.

Population - 1020.

39. *Rev. Geo. Philipps*, curate in charge.—Boys here begin to go to work at 7 or 8 years of age. Two of the employers here fix the age of continuous employment at 9 and one at 10 years of age.

There are no boys in the day-school over 10 years of age, whereas we have girls of 15 and 16. With very few exceptions, every farm labourer sends out his boys to work at 8 or 9. Till last March, when I came here, there had been no school under a trained teacher in the parish for some years. The result of this is that we have a rush to the night school of lads who have been unable to get much education. Some of them are learning the merest elements. At Burton, one of our hamlets, there has been and is a partly endowed school, but this is three miles from Winfrith. We have found that for young lads under 12 the night school is not of much use, because they are so tired after their day's work as to be physically unable to learn. We have found it best to put them in a separate class, under the charge of some ladies, at an earlier hour than the night school, where they can be more closely attended to and sent home at 7·30.

40. *The Rev. Eldon S. Bankes*, rector of Corfe Castle (population, 1,903), in a return sent to the Commissioner.—"More than half the population are day " pitmen, so it is hardly an agricultural parish.

"I consider that we want no restrictions on female " labour, but we do want them on the age at which " boys are now going out to work."

[By the table affixed it appeared that 12 boys

between 8 and 10, and 12 between 10 and 13, were at work. 20 girls between 13 and 18, and 30 married and 10 unmarried over that age, were at work.—E. S.]

"Not many women or children are employed *regularly* on farms.

"Boys should not be employed under 9."

41. *Mr. J. T. Hillier*, schoolmaster at Swanage.—"Children who work in farms, gardens, or in quarries, &c., leave school as a rule at the age of 8 or 9 years. Their attendance between 6 and 8 or 9 is irregular, because school is made entirely secondary to anything in the shape of work that they are capable of doing.

"Children of the vagrant, migratory, or living-anyhow class, as a rule do not attend school at all. Fully 80 per cent. are educated in the streets or under worse influence. Fully 50 per cent. also of the children of out-door relief people are left to run the streets, and never attend school.

"My upper class in school is always of the children of the more thoughtful and better-to-do class. Farm labouring children rarely reach the fourth standard.

"After 15 years' experience I say that it is of no use having a good education within the reach of the agricultural class (as is very generally the case now), unless some influence, pressure, or compulsion, is put on them to seek it. The question is not how to multiply good schools, teachers, and apparatus, but to devise some law keeping children from the labour market (say) till 9 or 10, whether from the mine, factory, or field, and not allowing them to be employed, as a rule, till they can reach a certain standard of knowledge. After that age labour and school should be combined by requiring an attendance of so many days or weeks, either continuous or broken, for two or three years. After which they might attend a night school.

"Fifteen years' experience in teaching night schools proves that those who leave the day school at 9 or 10 with very imperfect education seldom come to the night school as a supplement, and those who do not attend a day school at all, or else but a very short time, keep away also from the night school, because they are ashamed to show their ignorance.

"Were such a scheme carried out, and boys required to attend regularly till 9 or 10, every skilful teacher would guarantee that, as a rule, they would leave the day school with such an amount of well-grounded knowledge as to be easily able to extend it by partial attendance afterwards."

42. *Mr. Rigby*, schoolmaster at Herston, near Swanage, writes:—

"The approximate age at which boys leave school is 8, girls 10.

"The attendance at school of these children commences to be irregular at about 6 years of age. Many of the children of the farm labourers do not go to school at all. The per-centage of children who rarely go at all is quite 25.

"Evening schools to them are mere drudgery."

THE VALE OF BLACKMOOR.

43. *R. R. Harvey, Esq.*, land agent, Sturminster Newton.—The farms in this district are small, varying in extent from 30 or 40 acres to 150, a very few only reaching 200 or 250 acres.

Women and girls are very little engaged in farm work. They work chiefly at glove-making, at which the former can earn from 3*s.* 6*d.* to 4*s.* 6*d.* a week.

It would be a wise regulation to prevent boys from working under 10 years of age, they should be at school to that age. For a boy to work regularly here under 10 years is an exception, but at 10 they are very much wanted to lead the first horse in ploughing or other farm work.

The large amount of allotment land in this and almost without exception in every other parish in this district (a married man having one quarter of an acre, and in many instances more) leads to a great deal of early labour, and for this work, as well as for bird-keeping, very young boys are taken from school by their parents; but besides this, many of the parents are careless about sending their children to school, seemingly grudging the penny or three halfpence a week, and are content to let them idle about the streets and do nothing. In the parish of Sturminster Newton there are upwards of 40 acres of allotment land.

Wages are paid generally to constant labourers every fortnight, and to occasional labourers weekly. Very little corn is sold to them, because so little is grown, but most of the dairy people retail their cheese and butter to their labourers; it is a bad plan, because they sometimes get an inferior article.

Excluding the superior labourer (the thatcher being reckoned a tradesman) the ordinary wages for adults in constant employ vary from 9*s.* to 11*s.* weekly, and in some cases a cottage rent free. Cider or ale is also given for about six months (summer) in the year being considered equal to about 1*s.* a week, no other extras. The quality of the cider is not always good, in many instances inferior; much depends on the soil on which it is grown. The system of paying a labourer 1*s.* per week all the year round instead of cider or ale is fast increasing.

In this district there is but little piecework comparatively speaking, the chief part is in hedging, ditching, or draining, but there is of that work only enough to employ about one man in five. Many of the regular labourers do not do piecework, but get an extra 10*s.* or 1*l.* at harvest. Good men will get perhaps three months' piecework, and will add 2*s.* 6*d.* a week to their earnings during that time. In consequence of the small amount of piecework, which in the summer is confined to mowing grass, cutting corn, and hoeing root crops, the smaller farmers often let their men go away for a time to get it elsewhere.

While the married labourer with a family is less well off, one of the great difficulties is that young men have more than they know how to spend properly. If they live at home they do not pay more than 4*s.* or 4*s.* 6*d.* a week to their parents for their keep.

The cottages in this district are many of them bad; one cause has been the old system, now fast wearing out, of letting on a lease for lives; in such leases there is generally a covenant to keep in repair, but it cannot be enforced through the want of means on the part of the leaseholder. Some building and repairing leases have been granted with very good effect. The cottages of the worst class are those belonging to small freeholders (masons and carpenters particularly), who build on speculation and for profit, and let them to the poor at very high rents; these cottages have usually one small room below, frequently only one, and never more than two above stairs, small, low, badly ventilated and badly drained, and as long as the demand for house accommodation in populous villages continues, the system will prevail.

I have had much to do with borrowing money from the improvement companies; their stipulations (through the Inclosure Commissioners) are usually that every room in a cottage about to be built should be 8 feet high, with not less than three sleeping apartments and the usual offices; the cost of building a pair of cottages on this scale is not less than 350*l.*, and when built with garden ground attached, let only at 3*l.* 10*s.* per annum each. This heavy cost is a great discouragement to cottage building.

STALBRIDGE.

Population - 1,929.

44. *Mr. Andrew Brown*, bailiff to Lord Westminster.—Farms generally consist here of from 200 to 300 acres, each of which would require two or three boys. In some cases boys will get regular work at 10 years old or younger, but not generally. Before that age it would be occasional only, and my belief is that

Dorsetshire.

Mr. Stanhope.

g.

up to 12 or 13 there would be three months in the year when boys would have nothing to do. Lads are sent very young with horses, and it's dangerous for them, as one would think. But I can't say that I ever heard of any accidents.

Boys do men's full work at 16 or 17 years old, but don't get men's pay.

Girls go early to "gloving," which is misery to them as long as they live. They are put down to it as soon as they can hold a needle.

The ordinary wages are 9*s.* a week in winter and a little cider, but I don't count the cider as any real addition. They are always paid in money. No potato ground is generally given. If they have any they pay for it.

"Tut" or piecework is often done by extra men, and not by the regular hands. It tempts men a great deal too much to leave regular employment at certain seasons.

Of the men that I employ I don't believe one or two in 10 can read and write at all respectably.

HASELBURY BRYAN.

Population - 761.

45. *Rev. R. Burdon*, rector.—"After a long experience in Northumberland I am able to speak as to "the real value of education to the labourer, when I "compare his independence in that county, where "good schools were common, and his dependence in "Dorsetshire. The moment anything goes wrong "here, the man has no resource but the workhouse. "When I came here there was only a little miserable "school, under a mistress. The effect of establishing "a good school has been to make the parents then "to send the children to it. They thoroughly appreciate a good school under a master. A mistress is "not supposed to have the power of keeping the older "children in proper subjection, and I have frequently "heard this complaint made by the parents. The "first thing we tried to teach was cleanliness; I have "seen the good effects of this spreading into the "cottages, and generally raising the condition of the "population.

"If I see the children come to the school so irregularly as not to be able to satisfy the Government "inspector, I threaten not to let them come at all, "and generally this has the desired effect. I believe "that the stricter your rules are the better your "school will be attended.

"A great fault among country schools is that "managers sometimes think they have done all that "is wanted when they have received a certificated "master or mistress. I suppose the certificate "guarantees their ability, but many of them are in "other respects quite inefficient.

"The very poorest will not keep their sons at "school after 10. I have had a good many instances "where they have said that they didn't like to stop "the boy's schooling, and so would'nt take him away. "But as a rule the labourer's boys leave by 10. "Some boys, younger than that, are employed in the "summer only, but the generality of boys are wanted "for milking or plough driving, and are employed "both summer and winter. The difficulty is that "the winter is the time when their parents really "want their earnings the most, and the summer is "when the farmers most need them. But supposing "boys to be required to attend school 100 days every "year up to 12, I don't think the families would be "much worse off on the whole.

"But no boy of this class ought to be kept at day-"school over 12 years of age, unless he shows "especial talent. If he is so kept he is worth nothing "afterwards. If you ask the parents, they say in "Dorsetshire phrase 'their hands get too delicate.' "The boys get an idea that they are too good to "work.

"By 12 a boy can get a fairly good education, and "if he is worth anything, he can afterwards help "himself by night schools or otherwise.

"We find that the girls don't as a rule leave before "12. Then they go to 'gloving' at home, which "is in many respects a very bad employment for "them."

MARNHULL.

Population - 1,444.

46 *J. Hussey, Esq.*, landowner and magistrate.—The farms in this parish are small, not one probably being over 200 acres. They are principally dairy farms. Each requires one or two boys on it. Hence boys are employed at a very early age, although I didn't suppose that they are as a rule wanted regularly till 13 years of age.

It's the most difficult thing in the world to get a woman to go to work here, even at the haymaking season. Girls never go. The "gloving" absorbs all of them. But they work a good deal in the allotment gardens.

The children in our Roman Catholic schools are taken away as soon as they can get anything to do. They, perhaps, learn to read a little, but as soon as the boys can get field work and the girls "gloving," they fancy their education complete and come no more.

Some few men in this parish work in adjoining parishes, as Fyfehead.

47. *Mr. Samuel Andrews*, farmer.—I have only one boy, who drives a plough for me. I give him 7*d.* a day. I can't get a lad to frighten crows for me; they are all wanted here. I want a boy too for sheep-minding. A boy of 7 or 8 will do this as well as a man, and that sort of work will often give him work all the year, and men here get 9*s.* to 10*s.* a week, and four pints of cider a day. They are all paid in money, not in wheat. They won't eat the second wheat; we farmers have to eat that. Their wages are paid every fortnight, on Friday.

48. *Miss Grimes*, national schoolmistress, Marnhull.—I have no boys now in my school over 8 years old, and no girls over 10. There are so many farmers here employing boys that they get work very young. Some will go out for 1*s.* a week to bird-minding. Men who work on the farms will get their lads to go when very young. One boy in my school went bird-keeping when he was not much over 4 years old. A good many go at 6 and 7. I had a boy in my school between 8 and 9 who was getting on nicely, and now he has gone off turkey-keeping, and I hear that he is not to come back. Lots of them that leave in this way can scarcely write at all. Just as they are beginning to learn they are taken away. I think they leave younger than they used to do.

The girls leave early to go to gloving. Little girls of 6 and 7 can do something. Even before they leave altogether they are very irregular, the parents wanting them from one cause or another; and then when they get to 8 or 9 years they are rather ashamed of the little they learn, and won't come any more.

The rector's daughters keep a night school in summer for the big girls, and in winter they, with another lady, keep a night school for the young men. The first winter I was here, I kept it myself.

STOURTON CAUNDLE.

Population - 395.

49. *Mrs. W——*, labourer's wife.—"What with 9*s.* "a week, and 15*d.* to pay for rent, and seven to live on "it, we hadn't much to spare, and so my boy went to "work at 9 year old to mind the birds. He's been "three years at it now, regularly all the year. Some "families don't like 'em to go so young. They like "'em to go to school. He used to get 1*s.* a week at "first, and he wasn't worth nothing to me, what with "clothes and everything. But I had to work when I "was young, so I must bring them up to do the same.

"I like him to go to school o' Sundays; but when "he's bird-keeping he's often out at work.

"Men get 9*s.* 6*d.* if they work o' Sundays, but they "have to work harder on Sundays than on any other "day. Some men get 'tut' work nearly all the year, "but if it's wet weather they can't do much in winter, "and I'd rather be sure of the money o' Saturday "nights.

"We've no 'lotments here. Sometimes a farmer "will set out a piece of land in the field; but we've "to pay for it."

. HOLWELL.

Population - 495.

50. *Rev. H. H. Wood*, rector and rural dean.—"One "disadvantage in the scattered nature of the parish, "some of the children have as far as two or even three "miles to come to school. Bird-keeping makes the boys "irregular, even while at school. Some go as young "as 5 or 6 years of age; one or two girls sometimes "go. But the schoolmistress cannot keep any boys "in the school after 7 years of age. They go out as "carter boys. You see such very little boys going "out with two or three horses. The girls stay till 10 "and then go to 'gloving.'

"We have a night school, which any boys not "attending the day school are allowed to come to. "So we have a few boys there only 8 years old, who "have left the day school and are at work. They "make very little progress."

. STURMINSTER NEWTON.

Population - 1,880.

51. *Mr. John Hammond*, deputy chief constable and inspector of nuisances.—"This is the only district in "the county in which the police have been charged "with the duty of inspecting nuisances. Here I look "after 20 parishes. The chief difficulty has been "with the outside of the cottages. Out of 120 notices "to abate nuisances which I have already given this "year, only one has been for overcrowding. That "case occurred at Marnhull, where a woman with six "daughters and one son were all sleeping in one "room. I believe that there are many bad cases, if "we could hear of them. Putting Lord Westminster "aside, I don't think that anyone else is building "cottages. As a rule, the cottages in these villages "are bad in size, in ventilation, in repair, &c.

"This place (Sturminster) has given us a great deal "of trouble. In one of the hamlets (Butt's Pond) "fever broke out last year, and I reported to the "Local Board on the subject. I found a great defi- "ciency of privies, some of the filth poured into an "open ditch, some of the privies polluting the well, "and in the cottages too little bedroom accommoda- "tion, and some with no ventilation.

"Stalbridge gave a good deal of trouble, but Lord "Westminster has built a great many new cottages "there.

"Manston was a place to which a great many "labourers had to go from here; but Lord Westmin- "ster has built three double sets of new cottages, and "so improved and altered others as to double the "accommodation.

"The labourers here are like the Irish, too depen- "dent upon the potato crop. Most of them have a "bit of land, and if their potatoes fail great destitution "follows."

---

52. TABLE showing the extent of the EMPLOYMENT of WOMEN in 23 PARISHES in DORSETSHIRE.

WHITECHURCH.—*Mr. H. Fookes* says—"We have "some difficulty in getting the women to go. In "other villages round many more go. In some cases "I know farms where 10 or 14 women are employed."

Mr. Fowler says—"If I was going to thresh with "my steam engine I should go to my carter's wife, "and tell her I want her for a day or two. We "consider that they are liable for that sort of work. "I don't much like women for it, because I have "known three or four accidents about here from it."

STOURPAINE. — *Rev. R. R. Watts.*—"Not very "regularly. All such employment tends to make "them coarse in manners and language."

MILTON ABBAS. — *Rev. R. Roberts.* — "Twelve "women and girls work here. In winter they work "in the barns, go with threshing machines, and "'hack' turnips. I never saw them put to any work "to which I should object, except on the ground of "exposure to weather. One of the worst results of "field work for them is, that it often leads to indecent "low talk, which is especially hurtful to the girls."

PIMPERNE.—Hardly at all.

HILTON.—*Mr. Garland* "employs two all the year. "In the winter they 'draw reeds.' They can spread "manure as well as men." The wives of the regular labourers work.

GUNVILLE.—Fourteen or 15 girls and women work here. It is "quite a class that go." Some go with the threshing machines, some cut corn.

TARRANT HINTON.—"Women work a great deal. "Some would work five days out of six all the year. "Some of them are very skilful reapers."

CHARLTON AND SPETTISBURY. — *Rev. H. B. Vizard* and *Mr. Bastard.*—"Few except at harvest. "Some five or six go from Charlton."

[The next six parishes are in the neighbourhood of Dorchester, where it is a common condition of hiring that the wife shall go out to work, or in her absence a daughter.—E. S.]

MAIDEN NEWTON. — The wives of the yearly labourers, or their daughters, go to work a great deal.

BRADFORD PEVERELL.—Same. "Women go on "machines." They work a great deal in the barns in winter.

PIDDLEHINTON.—*Rev. T. H. Roper.* — Same. "They go couching, spudding thistles, and weeding."

STINSFORD.—"About 11 women go. The only way "to get them is by having it made a condition of "hiring the husband. They get 6*d.* a day (or, if "they have no grist, 8*d.*)."

CERNE ABBAS.—"Work on every farm, and during "a great part of the year."

BROADMAYNE.—"All the grown up women work."

[The six next parishes are from the Heath districts.—E. S.]

WOODLANDS.— *Rev. J. M. Truman.*—"Fifteen "are employed, three of whom are unmarried. The "employment has a very injurious effect on their "morals, and renders them utterly unfit for domestic "duties."

ST. GILES'.—*Mr. T. J. Turnbull.*—"Few work "here, except at harvest. Some go to threshing "machines, some spread manure, but it is not general. "Men are kept back by working in company with "women."

EAST STOKE.—"Some farmers will not employ a "man unless his wife will work. They go upon "threshing machines."

WINFRITH.—"A great deal."

CORFE CASTLE.—"Not many regularly. Twenty "girls between 13 and 18, 30 married and 10 "unmarried women, work."

[From the Clay Districts.]

HINTON ST. MARY.—*Rev. C. I. Nicholl* and *Mr. R. R. Harvey.*—"Women and girls hardly work at "all here, because of the gloving. Girls can do this "almost as soon as they can hold a needle, and are "fit for nothing else when they take to it."

MARNHULL.—"Gloving absorbs all; but they work "a great deal on the allotments."

STOUR PROVOST.—"About 12 girls from 13 to 18 "and 16 older women work here." "It does not "interfere with their morals or training."

Dorsetshire.

Mr. Stanhope.

g.

53. TABLE showing the extent of the EMPLOYMENT of YOUNG GIRLS in the fields in 16 parishes in DORSET.

WHITECHURCH.—*Mr. Fookes.*—"We never employ "girls."

SOURPAINE.—*Rev. R. Watts.*—"Not regularly."

PIMPERNE.—*Rev. W. Bury.*—"Not at all."

HILTON.—"They tent pigs after harvest." One leads a cart. There was too much "gloving."

TARRANT HINTON.—"Very seldom go."

CHARLTON AND SPETTISBURY.—"Few, except at "harvest."

STURMINSTER MARSHALL.—"Only potatoing and "gleaning."

FORDINGTON.—"Under 16 or 17 rarely employed. "Occasionally in the spring they are hired for weed-"ing."

BRADFORD PEVERELL.—"Under 15 go very little. "Sometimes one will go to tent birds."

PIDDLEHINTON.—"Girls rarely go under 14. Some, "however, go to pig-keeping after harvest, or to bird-"keeping."

PIDDLETRENTHIDE.—"Girls taken from school for "pig or bird minding about 8 or 9 years of age. "But few of them go unless their fathers live on "the farms."

CERNE ABBAS.—"Sometimes employed after har-"vest, but as a rule do not work."

BROADMAYNE.—"Go to bird-minding a little."

CRANBORNE.—"Few go before 16."

EAST STOKE.—"Do not go, except to gleaning, "&c."

WINFRITH.—"A few go pig-keeping after harvest."

[In the Vale hardly any girls work; they are almost all employed in gloving. Of the result of this Mr. James Buckman, of Bradford Abbas, says, "The "girls are fit for nothing; they cannot do plain sew-"ing, and are ignorant of domestic duties." To the question of the number growing up with insufficient education (in a population of 585) he answers "Fifty."—E.S.]

54. TABLE showing the age at which Boys and Girls leave School in Parishes in Dorset.

——	Boys.	Girls.
Whitechurch - (Certificated master and mistress.)	10, maximum -	14 or 15. In some cases a little knitting done.
Milborne St. Andrew. (Mistress.)	10, maximum -	Rather later.
Durweston - (Mistress.)	9 or 10. Irregular from 8.	13.
Milton Abbas -	9. Work begins at 7 or 8 for many of them.	——
Stourpaine - - (Certificated mistress.)	- - -	10 or 11 sometimes, on account of the knitting and gloving.
Pimperne - - (Certificated master and mistress.)	"Very unusual to keep them after 10."	12 or 13. A little gloving.
Hilton - - (Certificated master and mistress.)	10 or 11, maximum	Some girls leave before 10. "Gloving" common.
Langton - - Tarrant Gunville -	No schools.	
Spettisbury and Charlton. (Free school.)	Average, 9. Some begin work at 6 or 7.	About 11.
Sturminster Marshall.	8, maximum. In November only six in school were over 7.	——
Maiden Newton -	The poorest frequently send their boys to work under 8, and sometimes under 7.—(*Mr. Brown.*)	——
Bradford Peverell -	Average of last 14 is 9.	——
Charminster - Stratton - -	No schools.	
Piddlehinton -	"Out of 76 only three sons of agricultural labourers are over 8, and nine over 6."	13. "A little irregular the last year or two."
Piddletown - -	9, maximum.	——
Stinsford - -	8 or 9. They are more wanted in winter than in summer.	——
Piddletrenthide -	"Some between 6 and 7; most between 8 and 9. I have none over 9. Now and then the younger ones come back in the winter. Scarcely any of them stay the whole year."	10 or 11; will sometimes begin at 8 or 9.
Cerne Abbas -	Hardly any stay after 9; many leave at 8.	11 or 12.
Broadmayne -	8 or 9 - -	12 or 13.
Woodlands -	9, maximum -	12 or 13 (?).
Wareham - -	8 to 9. Occasional field work at 7 or 8.	9 or 10.
Wool - -	About 9 - -	12 or 13.
St. Giles' - -	8 - -	12.
Winfrith - -	8 or 9.	——
Swanage - -	8 or 9. Irregular at 6.	——
Herston - -	8. Irregular at 6 -	10.
Hinton St. Mary -	9, maximum -	Very early (gloving).
Marnhull - -	8, maximum -	10, maximum (gloving).
Holwell - -	7, maximum -	10 (gloving).

55. *Miss Young*, mistress of the night school at Cranborne, gave me a list of those attending her school, from which it appeared that (of the children of agricultural labourers)—

Three had never attended a day school.
Four had left a day school at 8 years of age.
Ten at 9.
Four at 10.
Five at 11.
Two at 12.

Among those boys at work who were stated by Miss Young *not* to be attending her night-school—

Two had never attended a day school.
Two left it at 7 years of age.
One at 8.
Five at 9.

NIGHT SCHOOLS.

56. Night schools existed in winter only, and with more or less regularity, in 33 parishes out of 46.

Mr. James Buckman, of Bradford Abbas, says of them, "During the winter when they have been in "operation, the children leave the day school at an "earlier age. This is one of the evils attending "them. The chief obstacles are the absence of any "desire on the part of some of the young people to "obtain instruction, and the difficulty of being pre-"sent in time for the commencement of school "(7 p.m.), though they profess to leave off work at "6." Mr. Andrews, night school teacher at St.Giles', had tried going to four villages round, one night a week to each. He failed, because of the places being too small, so that very few attended. His objection to the system, however, was that it was only once a

week for each lad, who forgot as much as he learnt. Boys were not worked at home in the interval.

57. MEMORANDUM by Lord Sidney G. Osborne, of children born and educated in Durweston, the object being to show how far their education has enabled them to go into the world.

In this memorandum the names have been carefully taken from parish register and other sources of children who have been in the Durweston schools, *i.e.*, in the day school of Lord Portman, and the Sunday and night schools held at the rectory; the period embraced being about 24 years.

In the census of 1861, the population, 364; the acreage, 1,763 (Post Office Directory).

As the rule, with scarce any exception, the children of the labourers all have schooling in the day school; a large proportion have gone through the Sunday school. The night school has existed 16 years.

It appears that out of 187 children thus traced, 129 are accounted for as having left the parish, 58 only remaining. Of the 129 who have left the parish, emigrated (males and females) 24, with four whole families; females married out of parish, 32.

There is an adult school for girls, to prepare them for service after leaving the day school; this has doubtless been the means of getting a great many of them out into the world; and will account in some measure for the large proportion (32) who have married and left the parish. But I ascribe the few marriages which take place in the parish a great deal to the difficulty of young people getting a home when they marry on the spot.

Those who went to Australia were all of them sent by the Emigration Commissioners, who gave me a ship to fill, I picking out only thoroughly respectable families from this and other parishes; they have all done well, and some have sent home money to take their relatives out to them.

---

58. TABLE showing the condition of the cottages and gardens in 37 parishes in Dorset.

WHITCHURCH.

Population - 554.

Mr. H. Fookes.—"Mrs. Mitchell's are very good; "Mr. Compton's older, but very comfortable. Rents "of the former, 1*s.* a week. Some others are let "from 4*l.* to 5*l.* All have allotments and small "gardens."

STOURPAINE.

Population - 658.

Rev. R. R. Watts.—"Very bad. Many families "have not more than two bedrooms; some not more "than one (*see* ante. No. 13). Many of them are let at "high rents, and have no garden or outlet." An open parish.

MILTON ABBAS.

Population - 1,014.

Rev. R. Roberts.—"23 cottages have been built by "Baron Hambro', eight of them being substitutes for "others pulled down, or otherwise used. Few now "have more than one family in them. Most of them "are built of 'ceobb' (mud), and are more weather-"proof than some of the brick ones. All have good "gardens, and allotments (if they like). Rent, "3*l.* 9*s.* to 4*l.* There is great difficulty in getting "them to keep their drains, pigsties, &c. in order."

PIMPERNE.

Population - 495.

Rev. W. Bury.—"Almost all the cottages have "been replaced by new ones by Lord Portman. All "have small gardens and allotments. Rent, 1*s.* a "week."

HILTON.

Population - 833.

Rev. H. Snow.—"Very few cottages have one bed-"room only, nearly one-half of them have three."

TARRANT GUNVILLE.

Population - 441.

Rev. J. Watts.—"Not many with one bedroom; a "good many new ones; most have gardens and allot-"ments. Rents, 14*d.* a week."

TARRANT HINTON.

Population - 258.

Rev. C. D. Saunders and *Mr. G. Hill.*—"Were "wretched 25 years ago. Are now good; only one "bad one, a freehold. As a rule they have two bed-"rooms. All have gardens and allotments. Rents, "1*s.* and 2*s.*"

CHARLTON.

Population - 553.

Rev. H. B. Vizard and *T. H. Bastard, Esq.*—"Some very good ones have been built by T. H. "Bastard, Esq.; but a good many hovels have been "run up by speculators, and let at 5*l.* and 6*l.*, with "no gardens; one has neither privy nor back door. "Most of them have gardens. There are 33 allot-"ments."

SPETTISBURY.

Population - 668.

"Very bad. A few have one, no ordinary cottages "have three bedrooms. They are generally let with "the farms, and are in terrible repair. The gardens "are very small. There are not privies to every "cottage. There should be better inspection."

STURMINSTER MARSHALL.

Population - 850.

Rev. C. K. Paul.—"Bad. Belong to three owners. "Some with one room above and one below; others "with room and stairhead above. Sanitary arrange-"ments bad. All have not privies. The farmyards "are allowed to drain into the street. A good many "have no gardens. No allotments. Rents, 1*s.* 6*d.* to "2*s.* a week."

MAIDEN NEWTON.

Population - 844.

Mr. W. Partridge.—"No bad cottages."

"Some 20 men walk a long distance from here to "work; some go 2½ miles."

FORDINGTON.

Population - 3,258.

"Shameful, as I saw for myself. No gardens or "allotments, and hardly any rents under 2*s.* 6*d.* a "week."—(*See* in detail, Evid. 61 post.)—E. S.

BRADFORD PEVERELL.

Population - 361.

Rev. H. B. Williams, Mr. J. Symes, and *Mr. J. A. Smith.*—"Sufficient. Several pulled down lately and "rebuilt. On the whole fair. None containing a "family have one bedroom. All have gardens. No "less rents than 5*l.* a year. Pigs not allowed."

STRATTON.

Population - 351.

"Very bad."

CHARMINSTER.

Population - 1,020.

"None let for less than 5*l.*"

PIDDLEHINTON.

Population - 414.

Rev. T. H. Roper.—"Above the average. A fair "number have three bedrooms, and the rest have two. "Most of them have small gardens. There are seven

Dorsetshire.
Mr. Stanhope.
g.

" acres of allotments. Rents average 1*s.* 6*d.* a " week."

STINSFORD.

Population - 357.

" Fair. Half have three, almost all the rest three " bedrooms."

PIDDLETOWN.

Population - 1,241.

" Mr. Brymer's new cottages excellent. Some are " let at 3*s.* a week."

PIDDLETRENTHIDE.

Population - 793.

" Moderate. Nearly all have gardens. Rents, 4*l.* " to 5*l.* There are allotments."

CERNE ABBAS.

Population - 1,185.

Rev. A. H. Bull, Mr. Beach. — " Very poor ; " most of them are thatched. There is scarcely one " with three bedrooms; most have two, but the " separation is often very indifferent indeed. Rooms " in most cases very low, hardly six feet, and *the* " *windows are very often not made to open.* They " were generally lifeholds now run out. Rent varies " from 4*l.* to 5*l.* The Board of Guardians appoints " the clergyman and guardians in each parish to see " after nuisances. Mr. Beach considers the necessity " for the appointment of a paid inspector imperative. " Mr. Bull (in discharge of this work) having been " round to the cottages, says, that the sanitary arrange- " ments are very bad, though improving. In some " cases he found only one privy to five or six cottages. " Even now there is not one privy to each cottage. " The drains are very bad ; the water supply good. " Nearly all have gardens, and there are 120 allot- " ments of from 10 to 40 perches."

BROADMAYNE.

Population - 506.

Rev. W. Urquhart.—" Very few here have three " bedrooms. Some have one, and a family in them. " These belong to small speculators. Not all have " gardens. They have one privy to each cottage. " Six in place have one only."

[From the Heath District.]

WOODLANDS.

Population - 495.

Rev. J. M. Truman. —" The greater number " of the cottages are held by copy of Court Roll " or on leases for 99 years determinable on lives ; " others are built on the waste, for which a nominal " rent is paid. The accommodation in them is in " many cases very insufficient. They have not all " got privies. The *other* cottages belong to Lord " Shaftesbury, are generally in good condition, and " sufficiently commodious. All of them have gardens " and (if required) allotments."

ST. GILES'.

Population - 436.

" Belong to Lord Shaftesbury and are excel- " lent. All have large gardens and allotments. " Rents, 1*s.* They have the opportunity of buying " milk at a low rate."—E.S.

BERE REGIS.

[See post No. 60.]

CRANBORNE.

Population - 2,656.

Rev. I. H. Carnegie.—" In Cranborne proper " they are improving. Lord Salisbury has built " and is building. There remain some very bad " ones, many of which belong to small owners. One " row of this sort, four in number, was built for old " people, but contain families. They have one bed- " room only. Garden deficient, but there are large " allotments. Rents, about 4*l.*"

These were very bad here. Some were life-holds not fallen in. Privies are deficient. One row of houses in " the alley " had no back doors. They were said to be bad also at Verwood, a part of the parish.—E. S.

WOOL.

Population - 590.

Rev. F. Newington. — " Very poor. They " generally have two bedrooms. Gardens very small. " There are allotments."

EAST STOKE.

Population - 594.

Rev. W. V. Hennah, Mr. Geo. Foot.—" Those " let on lives are very bad. Many have one bedroom " only. They are mostly mud and thatch. Hardly " one has three bedrooms. Most occupiers have the " right of cutting ' turves.' Rent 2*l.* 10*s.* to 3*l.* with " a garden."

Privies deficient. In one two-bedroomed house were a mother, three daughters, two sons, with the wife and child of one of them.—E. S.

WINFRITH.

Population - 1,020.

Rev. Geo. Phillips, Mr. Damen. — " Miser- " able. Most of them belong to one owner, some few " being still out on lease. Almost all are wretched. " As a rule they have one bedroom and a small " landing place at the stairhead. In some cases the " flooring is so bad that the water stands in it in rainy " weather. The greater number have no privies. " They all have gardens."

CORFE CASTLE.

Population - 1,900.

Rev. Eldon S. Bankes. — " Cottages in parts " very bad, but improving. The worst are run up on " life leases. I have one family of eight living in an " outhouse built for a calf, and one cottage on the " heath (divided into three) contained 33 souls at the " last census.

" On the heath they are built of mud, which is the " warmest material. In the other parts they are of " stone varying in size ; fire-places wanted in bed- " rooms ; drainage good. One village in the parish " has Moule's earth closets in most satisfactory work- " ing. Gardens and allotments good. Rent, 3*l.* " to 4*l.*

[The following parishes are in the clay districts.]

STOURTON CAUNDLE.

Population - 395.

[Belongs mostly to Sir H. Hoare. The cottages very bad, but described as " thinned out to what they " used to be." A good many one bedroom only. Four in one row had one. Sometimes " they put " another bed on the landing." One house had two families in it. No allotments.—E. S.]

HOLWELL.

Population - 495.

Rev. H. H. Wood. — " A few very bad cot- " tages built on the waste. Others let on leases of " lives are bad. Mr. Digby has built four good ones " with three bedrooms. Most have gardens. No " allotments. Rents 1*s.* to 2*s.* Inspection of nui- " sances done by guardian of each parish."

HINTON ST. MARY.

Population - 342.

Rev. C. I. Nicholl. — "Small tumble-down "places as a rule. Most belong to one landowner, "though a few miserable ones are the property of "small tradesmen. Not many have one bedroom, "but I do not know one good one. Most have gar- "den and allotments. Rents 1*s.* to 1*s.* 6*d.*"

MARNHULL.

Population - 1,444.

Mr. Hussey. — "Improved very much of "late, though there are still some very poor ones. "Those let on lives are in bad repair and very bad. "Most have gardens. I let 40 allotments in quarter "acre plots, in which I allow ploughing. Rents "(with tiny garden) 4*l.*"

Mr. S. Andrews.—"Allotments one quarter to half "a mile off, and not useful to all."

HASELBURY BRYAN.

Population - 753.

Rev. R. Burdon. — "The cottages, which are "very poor, have in many cases been run up by "the people themselves upon the waste and then "mortgaged. A great many have one bedroom and "one room under it. Most of them have mud "walls. The floors are generally of mud, which "makes them very damp. Few can be rented under "4*l.* or 4*l.* 10*s.* without a garden. I give allotments "and all but one or two families have one."

STALBRIDGE.

Population - 1,929.

Mr. A. Broun.—"Lord Westminster has built "32 cottages now within the last seven years. "Scarcely any have been pulled down. They all let "at from 4*l.* to 7*l.* including quarter acre of garden. "I only know of 9 or 10 cottages being let with the "farms."

STOUR PROVOST.

Population - 889.

Rev. R. Barrett. — "The accommodation is "improving. Some few hundred acres belong to "Lord Westminster, who is building good cottages. "Many of them are let on lives by King's College; "the poor hire them from the lifeholder.

"On the ground floor there is usually one room, "11 feet × 11; a small room about half that size "behind. *Often the window does not open.* Many "have no drainage. A privy and cesspool in the "garden; if there is drainage, it goes into the cess- "pool near. Above, there is generally one bedroom, "sometimes two. The houses are mostly thatched.

"Many of the families sleep in one bedroom. The "water supply is very badly, and there are few "pumps. Most cottages have a small garden."

BRADFORD ABBAS.

Population - 585.

Mr. Buckman. — "Sufficient. Usually one "room downstairs and scarcely two rooms up, say "one room and a closet not closed from it. Ven- "tilation through cracks, as few windows will open "from the rust of hinges, &c. Drainage very "imperfect. Ownership mostly in the landowner, "and rent low. Gardens and allotments ample."

---

59. [For the following return I am indebted to the kindness of Captain Amyatt Brown, Chief Constable of Dorset.]

RETURN showing the number of three-bedroomed, two-bedroomed, and one-bedroomed cottages, and also the number of one-bedroomed cottages containing a family of three or more children in the unions of Wimborne and Cerne.

Name.	Three-bedroomed cottages.	Two-bedroomed cottages.	One-bedroomed cottages.	Cottages with one bedroom, containing three or more children.

[Result.—16 per cent. of the cottages have one bedroom only; in $5\frac{3}{4}$ per cent. there is a family of more than 3 children in the one-bedroomed cottages.]

60. [The following specimens of cottages at Bere Regis were described to me, and some of them seen by me.

Cottage with two bedrooms, hardly any garden; rent 5*l.* The second bedroom was only a landing at the staircase head; the grandmother slept there. In the other room slept mother and four children, including one son of 14. Empty since my visit.

Another, let at 5*l.* a year, had one bedroom only, and contained (till quite recently) a man and wife, four sons that go to work, two small sisters, and one old enough to work, and one small boy.

Woodbury hill, a hamlet, contained many bad cottages. Water was not to be got on the hill. As to privies, "some have made them themselves, and I "think each house has one now."

Dorsetshire.

Mr. Stanhope.

g.

In one house without any windows there lived all through last winter a family with earnings estimated at 19*s.* a week. They were living there October 1868. They had previously lived in a house with one bedroom, and hardly a roof to it. They consisted of a man and wife, a boy (19), and a daughter with two illegitimate children.

In one building without any window at all, or any opening, but the door, there lived last winter a father and mother, a boy of 10 and a smaller boy, and a girl about 9 years old.—E. S.]

61. [The following cottages were among those on the Duchy of Cornwall estate at Fordington. The worst of all, "the Barracks," were not occupied by agricultural labourers.

(1.) Attached to a farm, contained two carters, the wife of one, a girl and two boys. You could hardly stand upright in the two bedrooms.

(2.) Four "model" cottages, let at 10*l.* 10*s.* a year each. Three of them contained two families.

(3.) Attached to a farm, containing man, wife, and five children. One bedroom, same size as lower room (about 14 × 8). Rent 2*s.* The back of this cottage and of the next opened into a farmyard, which slanted down towards them. No garden.

(4.) Of the same size but rather worse than the last, containing man, wife, five children, and a sick man. Rent 2*s.* 6*d.*

(5.) With one room above and one below, containing man, wife, and four children. Rent 2*s.* 6*d.* a week.—E. S.]

62. *The Right Hon. Lord Portman*, Bryanstone, Blandford.—"I have had great experience of the "system of letting cottages with farms, because I have "so let them on 21 years leases, and have had to "wait till the leases expired before I have had any "power to change the system. The objections "which I have found are, first, that the occupiers of "cottages have sometimes been persons whom I have "wished to get rid of, but who have been good "labourers and therefore useful to the farmer. Some-"times they have been men guilty of petty acts of "thieving; sometimes their families have included "daughters of such a character as to exercise a "demoralizing influence upon the whole place; and "yet the answer of the farmer to my expressed wishes "to get rid of them has been, that the man is too "useful to him as a skilled labourer.

"Secondly, I have found that in some cases the "farmer has oppressed the labourer by actually mak-"ing him pay him such a rent as to produce a profit "from the cottages which I have let to the tenant "with the farm, or by putting into a cottage lodgers "beyond its capacity.

"And, thirdly, I have found the farmer constantly "neglect to look after the cottage, not only by omission "of whitewashing, but by neglect of simple cleaning.

"On the other hand, it is certainly very important "to the tenant to have certain cottages under his "control, especially for his foreman, shepherd, carter, "or other labourer most important to him.

"For these reasons the plan which I adopt is to give "generally four cottages to the tenant as a part of "his farm at 1*s.* a year rent. In all the other cottages "the rent is paid to me, although the tenant nomi-"nates. The lease under which I let them to the "tenant farmer contains clauses enabling me at any "time to inspect the state and condition of the cot-"tages, requiring the tenant not to allow more than "—— persons above the age of 12 years at any one "time to inhabit the cottage, and in the event of any "person who shall be considered by me to be an im-"proper person occupying the cottage, the tenant is to "discharge him forthwith on my giving him notice.

"The cost of a cottage depends so entirely upon "the cost of carriage, and its situation, that no esti-"mates apply equally to two places. On the lias we "only have to open a hole and build a cottage with the "clay. A cottage may be built in one place for 100*l.*, "and two miles off it will cost 140*l.* Some cottages "I build of 'ceobb' or mud, the chalk on which I "build making an excellent substance for a wall. "This is one-third cheaper than brick, and if I were to "begin building again, I should build many more of "mud; but it requires a skilful builder. It corre-"sponds to the new 'concrete' plan, and I am not "sure that cottages of this material are not the most "comfortable.

"Iron does not answer; it is very cheap, but is "affected by heat and cold.

"Wood is more expensive than mud. And brick "and flint, which is the ordinary material now used, "is the most expensive of all.

"When I build in a village, I generally put from "four to six cottages together, but never anywhere "else, because of quarrels. Some time ago we tried "a common oven for several cottages, but it did not "work. Now I have an arrangement of a hearth, so "that each family can bake separately.

"The scarcity of fuel has led in most villages to "the practice of 'wooding,' which consists in pick-"ing up dead branches in the woods, but which "offered great temptations to stealing wood. We "broke through this system by collecting heaps of "fuel and selling it to the poor in winter, and now "we have coal clubs. At Pimperne there is a piece "of ground where the poor have the right of cutting "gorse; at Durweston a man goes round with fag-"gots, which he sells at 1*d.* each, the cost price.

"The allotment gardens we give to the labourers are "mostly a quarter of an acre, and that is enough. "Very often they don't take it at all. Our charge is "always 4*d.* a 'lug' (rod), including tithe and rates.

"We used always to resist the use of the plough, "but we find that difficult to do where a man is in "such regular hard work as not to have time to do "justice to his allotment, and then we allow him to "get a 'jobbing' man to plough it for him. At least "we wink at his doing it."

63. The following extract is from an address delivered to the "Blandford Farmers' Club," by the Rev. Lord S. Godolphin Osborne, and published by request of the Club.

"I am clearly of opinion that the landlord should hold all the cottages in his own hands, under his own direct control. I consider all sub-letting to be a great evil. It is, as I have said, a clear duty of the landlord to find a certain number of dwellings conveniently situated for the chief farm tenants. This affords to the tenants liberty to put such servants into them, and it may, perhaps, be said that these are likely to be some of the most respectable and orderly of their race.

"I grant it, but as I hold the landlord to be in duty answerable for the supervision of the whole economy of his estate, and especially as regards the sustaining order and decency amongst the poorest and most numerous class upon it, as he has to see that all the repairs to the dwellings are done, and that his own provision for the moral conduct of the labouring class is not abused. I consider he can only effectually do so by holding all his cottages in his own hands; but of course I assume that in the case of the cottages set apart for the chief farm servants, he would always listen to any fair application from the employer wishing to change any of the occupants.

"I can quite understand the argument of the tenant farmer, that it is most important to him to have his shepherd, his stableman, and a few others, so under his command that he can dismiss them at his will, and, therefore, that he ought to have the power to give the same notice to quit the cottage that he gives to quit the service. I must, however, state my conviction that it is a lesser evil to make this contingency a matter of arrangement between the landlord and the tenant, both foreseeing the necessity of some understanding in the matter, than to leave the cottages to be sub-let by the tenants, giving them all the power over their occupants."

64. Extracts from a paper on "Agricultural Labourers' Cottages," read by Mr. J. G. Homer (president), before the Dorchester Farmers' Club, on November 28, 1868.

"We will now consider whether it is an advantage for men to hire their cottages, or to have them rent-free, found by the employers. Take first the man that hires his cottage, and depends for his work at the best market, and make a calculation of his earnings. The first six months from Lady-day to Michaelmas I calculate (if a good workman) 12*s.* per week; from Michaelmas to Lady-day, 9*s.*; making an average of 10*s.* 6*d.* per week for the year. He will have to pay at least 2*s.* per week for house rent, fuel, and rates, leaving 8*s.* 6*d.* per week for his maintenance. This, I believe, to be up to the general average of wages for out-door labourers, as there will be several weeks lost by bad weather and other things, and not always certain of getting work. Take another instance of a man renting his house. This man may hire himself for a year as a general labourer at 10*s.* per week; 20*s* and his liquor extra for harvest. This man will have to pay his rent and rates, and also to buy fuel, which will leave him barely with 9*s.* per week. This man, however, I think better off than the man always depending on the labour market, as he has his regular pay and loses no time from bad weather. The two cases that I have brought before you will not apply generally to all men renting their cottages, as there are some who from want of skill and perseverance cannot earn the wages first described, and others will not hire themselves by the year; consequently during the winter they are often out of work, and poaching and petty thieving are resorted to. We will now take the case of the yearly servant, who is provided with his house on the farm. He is hired for a year at 8*s.* per week common work, to have piecework, such as hedging, draining, mowing, reaping, and turnip-hoeing, which will add from 1*s.* to 2*s.* per week more to his wages (this, however, must depend on the man, as some will earn much more at piecework than others); to have his grist—from two to four bushels of wheat per month, according to his working family—at 5*s.* per bushel, cottage, garden, and rates free; fuel, such as furze or wood faggots, for cutting, and generally coals given to some extent; from 20 to 30 lug of potato land, the ground prepared for planting without pay; and liquor found him for the year. This, I calculate, is equal to 12*s.* or 13*s.* per week, besides all the comforts arising from taking his meals in his house, and being always near his work. In many cases gristing is not allowed, and 1*s.* per week more is given in wages; but the men in general prefer the former, as they have their wheat at (on an average) 1*d.* per lb., and their bread is much better for family purposes. These men, I consider, are 2*s.* per week better off than men renting their cottages and depending on the labour market. We will now look at the disadvantages that both the occupier of land and the labourers are under in too many cases from want of cottage accommodation to secure certain labour for the whole year. We all know that good farming cannot be carried on without sufficient manual labour, and certain labour cannot be secured without cottages for the men to live in attached to the farm or in the parish. We will take, for instance, a farm requiring ten cottages, and it has only five; the consequence is you must fill those houses with large working families if possible, who, in many cases, are crowded together, regardless of common decency. It also causes constant change, because as the young men grow up they leave their father to look out for themselves, or get married. The consequence is you lose a good young man for want of a cottage to put him in, and the father is obliged to leave, too, as his family is not large enough; so a constant change is going on yearly, which is a great disadvantage to both parties."

Woodlands -	61	15 of these ¼ acre each. 46 of these ½ acre each.	1 4
Chalbury - -	24	17 of these ¼ acre each. 7 of these ½ acre each.	1 4
Hinton Martell -	88	71 of these ¼ acre each. 17 of these ½ acre each.	1 4
Total -	396		

Mem.—A few more occupied by persons not strictly of the agricultural labourer class.

[By this table it appears that 165 allotments are half an acre in size, 203 are quarter of an acre, and 8 are one-eighth of an acre.]

66. Cerne Abbas allotments. Extract of letter, dated January 23, 1869, from the Rev. A. H. Bull, vicar :—

"This scheme began in 1844 ; the allotments are distributed as follows :—

		Perches.	A.	R.	P.
10	portions of	40 -	2	2	0
14	,,	30 -	2	2	20
44	,,	20 -	5	2	0
57	between 10 and 20 -		4	3	20 nearly
125	allotments in area of		15	2	0

"Thus you see we have none bigger than a quarter of an acre ; and an old friend of much experience and wisdom in these matters once told me that he thought one-eighth of an acre or 20 perches was (generally) as much as a labourer could fairly cultivate consistently with the due attention to his master's work.

"The rent is at the rate of 48*s.* an acre, including rates, &c. The system appears to me to work well, promoting healthy occupation, good emulation, and sobriety of life."

[The evidence which follows (from numbers 67 to 72) is with reference to the amount of wages paid in this county.—E.S.]

67. Specimens of the amount and mode of payment of wages (generally verified by reference to employers and employed). It should be observed that in all cases they are *married* men.

(*a.*) BLANDFORD NEIGHBOURHOOD.

(1.) 9*s.* ; "wet and het" (irrespective of weather). 10 or 12 "lug" (perches) of potato ground (worth 12*s.*) Cottage and good garden at 1*s.* a week. (Total ordinary wages, 9*s.* 3*d.* a week). Piecework at grass and corn harvest,—estimated at from 1*s.* to 1*s.* 6*d.* a

week all the year. In addition to this some hops and malt given at that time for brewing.

(2.) 9*s.*; 6*d.* extra per week given for the wash, the family not being allowed to keep a pig. Furze carried for them (worth 15*s.*). (Total ordinary wages, 9*s.* 9*d.* a week). Piecework at grass and corn harvest, and cider then given.

(3.) 10*s.*; no other extras. Piecework at grass and corn harvest, and at turnip hoeing. Cider given at harvest only.

(4.) Carter and three sons near Blandford,—

	£	*s.*	*d.*
Father's total earnings (estimated by employer) -	30	0	0
Son aged 24 (?) - -	24	2	10
Son aged 22 (?) - -	23	2	6
Son aged 16 (?) - -	11	14	2
	88	19	6
Add cottage rent free -	2	12	0
	£91	11	6

Average weekly payment to each of four persons doing man's work, 8*s.* 9½*d.*

(β.) DORCHESTER NEIGHBOURHOOD.

(1.) 8*s.*, "wet and het." House and garden rent free (worth 1*s.* 6*d.* a week?). 20 lug of potato ground (worth 1*l.*). A ton of coals at Christmas (worth 1*l.*). (Total ordinary wages, 10*s.* 3*d.* a week). 1*l.* extra at harvest, in lieu of any piecework, and 1*l.* 10*s.* given for beer money. Half a bushel of "grist" corn every week at 5*s.* a bushel.

(2.) 10*s.* "Grist" when employer has it. "Tut" (piecework) at harvest only. (Rent 2*s.* 7*d.*, and rates and taxes.)

[The two following cases illustrate the difference in wages between two men working for the same employer.]

(3.) 8*s.* Cottage and garden rent free (worth 1*s.* 6*d.* a week). 12 "lug" of potato ground (worth 12*s.*). Some furze found in summer, and coal in winter (worth 2*l.*?). 1*l.* extra for harvest. Four days "mowing," and ale then given. Half a bushel of grist a week at 5*s.* a bushel (in consequence of which his wife was obliged to go out when required at 6*d.* a day instead of 8*d.*).

(3*a.*) 9*s.* 15 "lug" of potato ground (worth 15*s.*). Fuel in winter (arrangement only begun in 1868, and value unknown). "Tut" work at corn harvest only. Half a bushel of "grist" per week at 5*s.* a bushel. (His rent was 1*s.* 6*d.* "I'd rather rent my own house," he said, "because my wife can go out or not as she likes.")

(γ.) STURMINSTER NEWTON NEIGHBOURHOOD.

(1.) 9*s.* No extras unless paid for, except cider in summer and "grist" if wished. (House rent 1*s.* 3*d.* a week, with no garden or allotment.)

(2.) 9*s.* Three pints of ale a day. Cottage and large garden at 5*l.* a year.

(δ.) FROM A NOTORIOUSLY LOW-WAGE VILLAGE, WINFRITH.

(1.) 7*s.* a week. House and 30 perch of garden rent free (worth 1*s.* 6*d.*). Two loads of turf and some furze every year (say 28*s.*). (Total ordinary wages a little over 9*s.* a week). Does a good deal of "tut" work; has "malt and hops" given at harvest. Wages paid "when you like to go for them."

(2.) 8*s.* House and garden rent free (worth 1*s.* 6*d.* a week). Two load of turf and some furze (worth 28*s.*). (Total ordinary wages 10*s.*) No "tut" work, but 10*s.* extra for harvest. No "grist."

(3.) 7*s.* House and garden rent free (worth 1*s.* 6*d.* a week). 20 lug of potato ground (1*l.*). His turf is hauled for him, he cuts it (say 8*s.*) (Total ordinary wages 9*s.* 3*d.*). No "tut" work, but 10*s.* extra for harvest. "Grist" at market price. Wages paid once a month.

(ε.) IN THE NEIGHBOURHOOD OF CRANBORNE.

[The five men following lived in the cottages of Lord Shaftesbury, who also provided allotments. Their hours of work were one hour shorter than usual, being from 7 (having breakfasted first) till 5 all the year. Their rents were 1*s.* a week only.—E.S.]

(1.) 10*s.*, "wet and het." 12 "lug" of potato ground (worth 12*s.*). Total of ordinary wages 10*s.* 3*d.* Piecework at hay and corn harvest, at the rate of 4*s.* a day (including beer), added per week 2*s.*

(2.) 10*s.*, "wet and het." His fuel carried for him (worth ?) Piecework at hay and corn harvest. No additions.

(3.) Same as (1), but does less piecework.

(4.) 9*s.*, "wet and het." No additions. Piecework, and beer at hay and corn harvest only.

(5.) 9*s.*, "wet and het." No additions except fuel sometimes carried for him. Piecework and beer at hay and corn harvest. Estimated to be worth per week 2*s.*

(θ.) The following are specimens of the wages paid to two carters and two shepherds, as estimated by their employers only:—

[*Note by Edward Stanhope.*—In the case of *ordinary labourers* the *average* weekly wage in money is nearly 9*s.* 6*d.*; the average piece-work, or payments in lieu of it, amounts to 2*l.* 2*s.* 6*d.* a year, or nearly 10*d.* a week; the average value of beer (as estimated) is 2*l.* 5*s.*, or 10*d.* a week. Only 3 of the 12 have any other addition.

Waggoners average in money 8*s.* 9*d.* a week, with an estimated addition of 9*d.* a week for beer, and 5*s.* 6*d.* for other payments in kind.

Shepherds average in money 10*s.* a week; in beer, 9*d.*; and in other payments in kind, 2*s.* 11*d.*

Seven and a half per cent. of the whole labour account is paid in beer.

A young man of 18 earns 7*s.* 9½*d.* a week, everything included, except beer (estimated at 7*d.* a week).

The above table is due to the kindness of J. C. Mansel, Esq., who speaks of it as a "fair specimen," but thinks that cottages should be estimated only at 4*l.* a year.]

69. The following shows the mode of payment of some employers in the Heath district :—

(*a*). *A. B.*, labourer.

(His wages are 7*s.* a week, a house and garden, 20 lug of potato ground. No piecework, but 10*s.* extra at harvest.)

"We cut the turf and master pulls it. We men "have coal. Master gives 'gristing,' but only at the "market price. Sometimes we have a cheese. Wages "are paid every month, on a Monday. Then a "reckoning is made, and we get the rest of it, if "there's any to come to us.

"We keep a pig; but I'm obliged to look after that "to pay a little bill. It's not 1 in 20 times that we "get anything to eat off it, because I've got a little "family, and we pay our shoe bill when the pig is "killed.

"Six till five are our hours. At harvest we work

" longer, but we get cider or ale for it. So we do " when we do a job after hours."

(*b.*) Another man in the same village says — " Mr. —— pays wages when you like to go for them. " I go every five or six week. We get 'gristing' at " 5*s.* a bushel. We get barley for the pig. Some- " times we buy skim milk. When we go for our wages " an account is made up, and we get what is owing " to us."

70. Evidence of relieving officers as to the extent to which the agricultural labourers depend upon the rates.

Mr. J. Hallett, R. O. at Bere.—" Every labourer " that is ill in my district comes for the parish doctor. " Before they have been ill a week they come for relief " in most cases."

Mr. Hunt, R. O. at Cranborne.—" In nine times out " of ten men come for the parish doctor if a child is " ill. If a man is ill two or three days, he sends for " relief. Of course men do not come from Crichell or " St. Giles'."

Mr. J. C. Turner, late R. O. at Blandford.— " Taking the mass of labourers, they cannot, I believe, " stand a week's illness in the family. They cannot " afford to put by anything for a wet day."

Mr. Wallis, R. O. at Dorchester.—" They gene- " rally can't stand a week's illness."

[The following extracts are from the relief book at the Blandford union for two parishes (Michaelmas quarter, 1868). Relief was given to—

(1.) Wages 10*s.* Children ill.
(2.) Wages 9*s.* Funeral expenses of child.
(3.) Shepherd. Funeral expenses.
(4.) Wages 9*s.* Illness of child.
(5.) Wages 10*s.* Wife ill.
(6.) Wages 9*s.* No reason given. Relief in meat.
(7.) Wages 9*s.* Wife ill. Meat.
(8.) Wages 10*s.* Wife ill. Meat.
(9.) Wages 9*s.* No reason. Meat.]

71. Evidence of a grocer and draper.—" I am " doubtful whether harvest is as profitable a time to " the labourer as it is represented to be. This year " it only lasted a fortnight, and what with the extra " wear of boots and clothes, and with the extra food " and drink they get then, I doubt if they are much " better off after it. I always find they pay their bill " better in the spring than they do after harvest.

" As to the 'grist' corn, I know it is sometimes a " loss to them. Some of the farmers give such wheat " that the bread shown to me is of a dark colour. " Sometimes they say it is a gain. But I don't see " that a labourer who has the grist pays my bill better " than a man who has not.

" The great difficulty with them is the want of " providence to save up in order to buy an expensive " article, such as blankets, and the clothing club has " been a great help to them.

" The plan of giving credit to the poor, which I " tried in consequence of competition, has failed. It " led to a running account in which there was always " a balance unpaid, unless recourse was had to the " county court. It led to extravagance, the wife " having the book ordered things according to the " wants rather than the means of the family."

[Another grocer says—" The fruitful cause of " getting into excessive debt appears to me to be the " system of paying wages monthly instead of weekly; " the remedy, regular employment at equalized wages " throughout the year, with extra at hay and corn " harvest. I have seen teetotallers drinking pepper- " mint water."]

72. Extract from an article on the Dorsetshire labourer, which appeared in the " Labour Circular " of February 1868.

The facts related in this article are principally collected from a *particular district* (near Blandford), but still they may be taken as giving a pretty accurate description of the condition of the labourer throughout the entire county. In many localities, indeed, his position is much worse than that given here, localities where overcrowding, ignorance, filth, poverty, and drunkenness abound.

We shall endeavour to be as definite as possible, and will therefore commence by describing the wages given on some 13 farms which we have visited in the collection of information. Farmers number 1, 2, 3, 4, and 5, give 9*s.* per week, and eight to ten "lug" (pole) of potato ground in the field; number 6, 9*s.* per week and no ground. These farmers are bound by a clause in their lease not to give their labourers grist, the landowner thinking the labourer would thereby be paid more in money wages, which is not the case. Farmer number 7 gives 9*s.* per week, eight perch of ground, and two bushels of tailing, or light wheat, per month, at 5*s.* per bushel, let the market price be what it may. Farmer number 8 allows 9*s.*, the same amount of tailing at 5*s.* per bushel, and eight perch of ground. Teetotallers get 1*s.* per week extra, and in harvest, money instead of beer. Farmer 9 gives 8*s.* per week, four bushels of tailing wheat per month at 5*s.* per bushel, twelve perch of land to men, and eight perch to boys, and house rent free. Number 10 gives 9*s.*, ten perch of land, and from two to three bushels of tailing per month at the usual 5*s.* price. Single men on this and the previous farm have 10*s.* a week, and no grist. Number 11, same wages as number 10, but he sells his men flour instead of wheat. Number 12 gives 9*s.* per week to both single and married men, seven "lug" (perch) of ground to each man, and two bushels of tailing at 5*s.* to married men; and number 13 gives 10*s.* per week to married and single men, no grist, but a liberal allowance of potato ground, ploughed and manured, and fagots at less than half price. On this farm men's wages are not lowered when they get old, and after they are unable to work any longer, they are more or less pensioned and provided for.

On all these farms, and, we believe, all over Dorsetshire, carters and shepherds have from 1*s.* to 2*s.* per week extra, and house rent free. Some farmers, we know, give 10*s.* a week, and allow two bushels of tailing per month, at 5*s.* per bushel. It will be observed that wages range between 8*s.* and 10*s.*, the difference between these sums being generally made up by a difference in the amount of extras in land, tailing, housing, &c., allowed with them; the higher wages of 9*s.* and 10*s.* are frequently given without any additions.

In order that our readers may have as accurate an idea as possible of the value of the Dorsetshire labourer's remuneration, we will attempt to express, as nearly as we can, the worth of these various extras in money. To take the tailing first: a bushel of very good tailing, after the miller has taken 7 lbs. toll for grinding—and a pound will be wasted in grinding—he will bring back to the labourer 40 lbs. of seconds flour, and sixpennyworth of bran, which will be together worth about 7*s.* Now, the labourer pays 5*s.* for it in the first instance, and, therefore, on the whole transaction, only gets 2*s.* profit. But should the tailing be light, it will not produce so much flour by, perhaps, 10 lbs., and the labourer will not get 3*d.* by the transaction.

It might be thought that the men would be much benefited when wheat is high in price, by being able to get it at the fixed rate of 5*s.* per bushel; but in very many cases this is not so, for it often happens, when corn is high, the farmer sends wheat which otherwise would have become tailing to market among his other corn,—in other words, the tailing is composed of lighter stuff. One farmer we know supplies his men with 40 lb. of flour instead of the wheat. From this the labourer would get 1*s.* 6*d.* profit; but he would prefer it to the tailing, because he is sure to have the full weight. We would remark we are inclined to the belief that this tailing, and even some of the other extras, are considered more as a favour than part of the labourer's remuneration, because the quantity allowed is frequently regulated according to the number of a man's family.

We now come to the potato ground. Of this some

Dorsetshire.

Mr. Stanhope.

g.

get 15 or 20 lug; but, generally speaking, 12 lug for a man and 8 for a woman or boy. The value of this land is 6*d.* per lug; if manured and ploughed, which it is in a few cases, it is worth 1*s.* per lug. The ground will produce from half a bag to a bag of potatoes per pole. The farmer will haul manure to the land free of expense—but he will not give the manure—and will also carry home the labourer's crop at digging time. Suppose the labourer had 12 lug of land at 6*d.* per lug, this would be 6*s.*, which, with 5*s.* for carrying manure and potatoes, would be 11*s.* But it is very doubtful whether this land and carriage can be regarded as part of his regular day's wages. The labourer says it is an allowance for extra work, early and late, during the haymaking season, and for which he is not otherwise paid. As to the worth of the cottage when the labourer has it free, the rent paid for an ordinary cottage is about 1*s.* 6*d.*; the new flint and tiled cottages are worth about 2*s.* or 2*s.* 6*d.* per week, but are rented at 1*s.* to 1*s.* 6*d.* per week.

We will next consider the earnings of the labourer by piecework during the spring and summer time. Much is often said about the extra wages labourers earn in hay and harvest time, balancing them against their low winter incomes; but it should be carefully borne in mind that a summer day's work is almost twice as long and twice as exhaustive as a winter day's work. We remember once a farmer describing to us in glowing terms how well his men were paid. Not long after we met one of his labourers—one of the most intelligent among them—and we congratulated him upon his good circumstances, reckoning up to him the whole of his winter and summer wages, and dividing the total by 52, which, as the farmer said, was the way to get at his weekly income. "Stop, stop," said the man, "you are not reckoning "fairly. Do you call that a day's work when I rise "and am at work by daybreak, and work as long as I "can see during the longer summer days—often eight "or nine hours longer than a day's work is at other "times of the year? Besides, you make no allowance "for my paying the woman for tying and hiling (that "is, putting the corn in heaps) the wheat; you make "no allowance for ale, costing me several pounds "during the summer; you make no allowance for "hindering time in wet weather, or for purchase and "wear and tear of tools. There is a difference between "wages and earnings. If you take my wages as paid "to me during the winter season, and multiply them "by 52, that will be my wages; all money over and "above that are my earnings." What our friend meant was this, that if he earned twice as much wages in summer as in winter, it was for twice as much work and outlay on his part. But, putting aside all other considerations but the extra money cost to him of this extra work in summer, and looking simply at his earnings after this cost is met, we have yet staring us in the face one significant fact—which applies to all low-paid farm labourers—that the labourer's winter income is too little to meet his winter wants, and he is obliged to mortgage, so to speak, his summer wages. Many think the additional earnings of the labourer in harvest are so much for the good, to put by. Alas, they are too often already bespoke. The difference between what the labourer is paid, and what he requires for his support in winter, is frequently only met by the surplus paid him in summer, or, in other words, he has actually to pay the cost of much of his winter subsistence out of his summer earnings.

The average earnings at turnip hoeing is about 18*s.* per week, the labourer having to find beer. A man in a day will mow two acres of barley or oats, at 2*s.* 10*d.* per acre, finding his own ale; and he could mow two acres of wheat per day, at 6*s.* to 6*s.* 6*d.* per acre, finding his own ale, and paying 3*s.* to 3*s.* 3*d.* to a woman for tying and "hiling." A man in a day will "hew" from a half to a whole acres of wheat, at 9*s.* per acre, paying for his own beer, and to a woman 1*s.* 6*d.* per acre for tying and "hiling." For mowing clover grass he gets 2*s.* 10*d.* per acre, providing his own ale. Of this he can cut about two acres per diem. For mowing meadow grass he has 3*s.* 3*d.* per acre, without beer. For hedging, 6*d.* to 8*d.* per lug (pole). At this he can earn 2*s.* a day. A man will often not earn so much as he could at piecework, for fear the farmer should lower the price per acre. Sheep-shearers get from 15*s.* to 20*s.* per hundred for shearing. A good shearer will shear from 40 to 50 sheep in a day. They, however, find their own ale. Labourers who work by the day during the summer have 1*l.* gratuity after harvest. Those who cut wheat have 2*s.* 6*d.* per day, should their services be required to help in the corn after it is cut. Men not employed regularly on the farm, but who engage as day labourers for the harvest month, get 3*l.* for the month.

It is very seldom labourers get cottages rent-free, except carters and shepherds; and beer is not, as a rule, allowed. Women are employed on farms, but generally not more than two or three on one farm. They generally get 8*d.* a day, going to work at 8 o'clock in the morning. We do not know whether there are any children employed as young as 8 years of age, but there are some at 10 or 11 years. Labourers work from 6 o'clock in the morning to 6 o'clock in the evening, from Lady Day to Michaelmas Day, and from 7 to 5 o'clock the rest part of the year. There is a little employment for the girls, but not sufficient; it is sewing and knitting gloves. They can knit five or six pairs a week, earning 5*d.* per pair. They are, however, obliged to take out this amount in goods. At glove-sewing 12 pairs and 2*s.* 8*d.* a week are made.

We will try and picture the way in which these people live. A man generally takes his money once a fortnight, spends 6*d.* in beer, and the rest goes to pay his debts. He may have a shilling put aside for the "tally" man, but this is all. And his debts are not principally incurred through drink. Many only spend 6*d.* a fortnight in beer. In fact, 48 hours after the labourer has taken his wages he has seldom a shilling left. He generally smokes from one to two ounces of tobacco weekly. He purchases a pig of the farmer, and pays a shilling or so per week till it is paid for; and he gets his barley with which he fats it in the same way. His butter, too, he often buys of the farmer, to whom, consequently, he is often in debt, and seldom has much money to take. This destroys his independence, and helps to prevent him from migrating to other localities and to better masters. With his small potatoes and his tub of pig-wash he keeps his pig till Christmas, and then kills it, and sells half of it to pay the shop bill. He looks to his summer earnings to clear off his debts with the shop-keeper and shoemaker. He pays to a coal and clothes club about 8*d.* to 1*s.* per month, which is added to by about the same amount (in many places only one-third) by the lord of the manor and others. This gives about 4 cwt. or 6 cwt. of coal in the winter, and some clothes at Christmas. He has for his breakfast bread and Dorset cheese, called by him "choke-dog," and a cup of coffee; for dinner a rasher of bacon and vegetables, and coffee again; and for supper probably a rasher of bacon and fried potatoes.

We will take one or two examples of how these men live. First, a man and wife and four children, with wages at 11*s.* per week. Suppose this family have three meals a day, this 6*s.* 10*d.* will not leave $\frac{3}{4}d.$ for each person to be spent over each meal.

	s.	*d.*		*s.*	*d.*
Rent	1	0	Wages	11	0
Clothes	1	6	Food	6	10
Soap, soda, and blue	0	2			
School	0	3			
Candles	0	3			
Club	0	3			
Fuel	0	9			
	4	2		4	2

We will give a case known to ourselves—a labourer, with a large family, who is considered particularly

well off. He has a wife and seven children, and a lodger in the house, living at the same table, 10 people in all. Labourer's wages are 10*s.*; No. 1 boy, 6*s.*; No. 2 ditto, 5*s.*; No. 3 ditto, 4*s.*, wages per week. Lodger pays 5*s.* Extras from potato ground and other sources, 2*s.* Total income, 32*s.* Money to be spent on each meal, a fraction more than $1\frac{3}{4}d.$* A labourer does not buy butchers' meat; we do not suppose he ever tastes any, except at Christmas; but he will often buy suet, or, better still, dripping. His meat is generally salt pork, or bacon, off his own pig. We remember lately meeting a boy, 13 years of age, a bird-keeper, whose wages were 2*s.* 6*d.* a week ($4\frac{1}{4}d.$ a day!), who had in his dinner-bag bread, cheese, an onion, and salt; but he said he did not always have cheese.

[In letters to me in October, 1868, the writer of this article adds—"In consequence of some doubt "being expressed, I watched the butcher's cart on "the next Saturday, and to this class of labourers his "only sales were, to a poor man 1 lb. of suet, and to "a widow woman 1 lb. of suet on trust." "Some "have to pay more for their goods than they ought "owing to the scarcity of farthings. I hope they may "soon be as plentiful as halfpence.]

73. The following Extracts, relating to the Beer question, are from a pamphlet entitled "The "Agricultural Labourer," by J. Bailey Denton, Esq.

"At present the beershop is a great bar to the improved condition of the agricultural labourer. The influence of drink on an uneducated mind cannot be better shown than by the fact that beer or cider will go much further than its equivalent in money in inducing men to exert themselves, although the money could be taken home by the labourer for the benefit of the wife and children as well as himself, while the beer or cider, if drunk, is dissipated in selfish indulgence. The quality of the beer or cider sold in lowest wages districts is the worst.

"The liquid sold as beer in rural districts satisfies thirst at the time, and provokes it as soon as drunk. I cannot speak too strongly against the prevailing excessive use of bad beer or cider. It is the bane of the farm labourer. In those counties in the west of England where cider is used instead of beer, the impoverished condition of the agricultural labourer is even worse than where beer prevails. His inferiority in work is mainly to be attributed to the bad character of the cider, and the excessive use made of it. There is some proof of the injurious influence of excessive drinking, in the fact that in all the worst paid districts, where labour commands the lowest wages, and where those wages are all that the labour is worth, the publican and beer-seller bear a far larger proportion to the number of the agricultural labourer than is the case in those districts where the wages are higher and where the labour is more valuable. We often hear mentioned the low rate of wages in the county of Dorset, and comparisons are made with the wages ruling in other counties. When we turn to the statistics, giving the occupation of the people in the population returns of the last census, we find that whereas in Lincolnshire, which I select as the best cultivated county in England, the number of agricultural labourers is 52,871, and the number of people living by the sale of beer is 1,317, in Dorsetshire the number of agricultural labourers is 19,434, and the number of persons selling beer and cider is 582, showing a proportion in the former case of one beer-seller to 40 agricultural labourers, and in the latter, one beer-seller to 33 labourers. The proportion in Lincolnshire is much too high; but what is to be said of Dorsetshire, where the labourers, earning only two-thirds of the wages of Lincolnshire, support a larger proportion of beer and cider sellers? The figures given, moreover, do not fully represent the real state of things as regards the extent to which the beer and cider is drunk in Dorsetshire, as in that county a great deal of cider is given in lieu of money wages, whereas in Lincolnshire no such regular practice prevails either with respect to beer or cider.

"But I can illustrate this important part of the question by stating a case, within my experience, which can hardly fail to exhibit the fact that low wages and inferior work are associated with a preponderating use of beer or cider. In the year 1852 I had the control of some extensive drainage works in Dorsetshire, and at that time the agricultural money wages of the district ranged from 7*s.* to 9*s.* a week. Impressed that such pay was inconsistent with suitable labour, I imported into the work some north country labourers from Northumberland, practised in draining, to afford an example for such local men as chose to enter the trenches and dig by the piece. I guaranteed to the northern men a minimum of 18*s.* a week, although I could command the services of as many Dorsetshire labourers as I desired to employ at half that price. The result showed that I was right in bringing high priced competent men amongst low priced inferior ones, for as soon as the Dorsetshire men knew what the countrymen were getting, and saw the character of the work executed by them, they applied all their energies to imitation. At first they drank more beer, thinking that by such means they could do more work. They soon saw their error; and it was both amusing and instructive at the same time, to see how struck they were when they found that the northern men had for their dinners good meat and bread, while they were living on bread, tobacco, and miserable beer or cider. It was by very slow degrees that the Dorsetshire men realized the truth that butchers' meat was more strengthening than bad beer. Eventually, by the example afforded them, the 'technical education' given them by the Northumberland men, and by the effect of improved food, the despised Dorsetshire men were enabled to earn as much as their teachers, and it was not long before I actually removed them into the north of England, to compete with Yorkshire men in the work they had learned; and the first place in which they were engaged was Swine in Holderness, where there did not exist a public house or a beer shop in the village."

74. Extracts from the Prize lists of two Agricultural and Labourers' Friend Societies in 1868.

For working the greatest number of years in succession upon the same farm, or with the same master. Not exceeding 21 years of age.

WAREHAM AND PURBECK.

1*l.* 10*s.*, Charles Oborne, servant to Mr. S. Tucker, 14 years; second, 15*s.*, George Wilcox, servant to Mr. W. Budden, 14 years. [Both these must therefore have began regular work at 6 years of age.]

STURMINSTER NEWTON.

A coat, &c., John Hall, 13 years with Mr. E. Rossiter, Child Okeford; second, a coat, &c., Wm. Cuff, 13 years and four months with Mr. H. Fookes, Whitechurch. [Both these boys were therefore hired at 7.]

Prizes were given also to boys under 17 years of age for ploughing half an acre of land, with two horses and without a driver; to women labourers for working the greatest number of years in succession upon the same farm; and for maintaining the greatest number of legitimate children.

* As we wish to convey as exact an idea as possible of the Dorsetshire labourer's condition, we will give a description of a few more families visited by us. A., 9*s.* per week; wife and two children not earning anything; rent 1*s.* per week; no grist nor land. B., 10*s.* per week; wife and two children not earning anything; house rent free; no grist nor land. C., 10*s.* per week; wife and three children not earning anything; rent 1*s.* per week; eight lug of land, manured and ploughed. D., 9*s.* per week; wife and seven in family; one son earning 6*s.* per week, another son earning 5*s.* per week; total money wages, 20*s.*; profit from one bushel of grist per week, at 5*s.*, 2*s.*; rent, 1*s.* This family, therefore, has a little less than $4\frac{1}{2}d.$ a day to spend for each member's support. E., 10*s.* per week; wife and six children; son 3*s.* 6*d.* a week; total income, 13*s.* 6*d.*; no grist or other allowance; rent, 1*s.* 6*d.*; leaving only 12*s.* a week to support and clothe eight persons, a little more than $2\frac{1}{2}d.$ a day for each member of the family.

Dorsetshire.

Mr. Stanhope.

g.

Kent.

KENT.—EVIDENCE.

76. WEST KENT CHURCH OF ENGLAND SCHOOL-TEACHERS' ASSOCIATION.

A meeting of this association was held at Tonbridge on Saturday, October 24th, at 3 p.m., to meet the Hon. Edward Stanhope, Assistant Commissioner.

In the absence of J. C. Colquhoun, Esq., the Rev. R. L. Allnutt took the chair.

There were present the Revs. T. O. Blackall, of Seal, Egerton D. Hammond, of Sundridge, &c., and a large number of the masters and mistresses of neighbouring schools.

Mr. Stanhope having previously circulated a paper of questions among the members, the following summary of answers was drawn up by a sub-committee appointed for the purpose :—

ANSWERS from 32 SCHOOLMASTERS and MANAGERS.

(1.) The average age at which children leave school altogether is 10 or 11.

(2.) The average age at which they first leave school for field work is 8.

If the average applies exclusively to agricultural villages it would be from 7 to 8.

(3.) If any system of half-time be adopted, there is a divided preponderance of opinion in favour of attendance during so many hours per week.

(4.) The unanimous opinion is that night schools are not an efficient substitute for the day school.

(1.) In the discussion which followed the feeling in favour of some system of pressure, direct or indirect, was unanimous. Absenteeism was variously explained. Mr. Serjeant (Otford) attributed it a good deal to the apathy of parents, saying that in many cases the boy is only expecting to be sent to work. Mr. Gardiner (from a town school) thought wages the governing element in the question. The Rev. E. D. Hammond said, "Neglect of parents." Mr. Withers (of Knockholt) said sometimes half the children in his school are absent, of whom (say) two-thirds work on farms. The rest are weeding or assisting their parents.

The general opinion was that children were leaving school younger than formerly. One schoolmaster, with an experience of the Dorset system of hiring whole families, and the consequent very early employment on farms, advocated a prohibition of all employment before 10, and some simple half-time system afterwards. The Rev. T. O. Blackall recommended a regular time of attendance every year (say) during the winter months. Another schoolmaster argued for a system varying according to the age of the children, and thought that children about 12 years old did not suffer from prolonged absence so much as some believe.

(2.) As regards night schools, there was a disposition on the part of the masters present to look upon them as tending to injure the day school, by causing the children to be withdrawn from it younger. It was shown that under the present Government system an interval was left between the age of their leaving

school and their being admitted to a night school. One gentleman strongly advocated the foreign system of early morning school from 6 to 8 a.m.

(3.) Industrial schools were much approved in principle, but thought impracticable on the ground of expense. Mr. Blackall and others urged also that the parents objected very strongly to it, mainly on the ground of injury to the children's clothes. But the lamentable ignorance of these subjects was admitted. The theoretical teaching now given in many schools did not effect much.

The meeting then separated.

---

77. A meeting of clergymen and farmers from the neighbourhood of Sevenoaks took place at Wildernesse Park on Monday, Dec. 28th, to confer with the Honble. E. Stanhope, Assistant Commissioner. There were more than 40 gentlemen present, amongst whom were the Rev. T. O. Blackall (in the chair), the Rev. C. Lane (Rural Dean), Revds. T. Sikes, R. B. Tritton, W. King, G. R. Moncrieff (H. M. Inspector of Schools for Kent), J. Polehampton, C. T. Astley, &c., Messrs. S. Turner, J. W. Whibley, Turnbull, Russell, Newington, Patching, &c.

Mr. Stanhope having opened the discussion :—

Mr. Whibley, of Sevenoaks remarked that boys were rarely employed regularly before 11 or 12 years of age, but unless they began then they seldom became skilled labourers. Work now was worse done, and more expensively, than formerly. At the same time he felt the value of education to his labourers. Four of them, who were probably the only ones who could read and write, were his best men. He objected also to accounts being settled by the master only. In his own case he obliged ignorant men to have their accounts looked into by educated comrades.

Mr. Turnbull strongly urged the advantage of education to the labourer, but that after all the best and truest education was upon the farm, provided two things were regarded, viz., proper supervision and better home training.

Rev. Egerton D. Hammond, of Sundridge, remarked on the superficial nature of the education now given, which might in some cases justify the complaint of "too much education" on the part of farmers. One common complaint was the ornamental needle-work taught in schools. He asserted (and in this was supported by the Government Inspector) that in no schools in this neighbourhood was anything but useful sewing taught. The real reason of the difficulty felt by farmers was, that everybody nowadays is trying to push upwards.

The difficulty of teaching children owing to defect in attendance is shown by his school register; out of 414 times when the school has been open, no child has attended more than 202.

Thinks that parents can and do afford to pay for schooling. Believes that no plan of half time would suit farmers; but thinks that the best practicable mode would be the requirement of so many days attendance in the year, so long as the date of inspection was fixed according to the requirements of field work.

Mr. S. Turner of Kemsing, thought that the labourer could ill afford to send his children to school in the winter, because his earnings were then many shillings a week less; and in his opinion the boys could be better spared in summer than in winter. (This opinion was much controverted.—E. S.)

Mr. Newington, a practical farmer for 40 years, complained of the want of education. The very business of a carter boy makes him a dull fellow. He is not fit to learn after his day's work. The only remedy was, he thought, education on alternate days.

The Rev. G. R. Moncrieff explained that he first began inspecting schools in Yorkshire, just as the Factory Act had been established, and yet all traces of the fierce struggle against the half-time system were gradually dying out almost at once. The effect was the rescue of education without any real interference with labour, as he thought. From thence he went to the mining districts, and while there the age at which boys might be employed was raised from 10 to 12. The remarkable result was that no inconvenience appeared to be caused.

Believes parents *can* afford to send their children, because where they are more than usually willing they do so; and even though the parents are worse off in the winter, he found from his experience that the children are there at that time, and are absent in summer.

The really practical plan was to fix some minimum time (and let the employers of labour do that), during which boys can really be spared from the labour of the farm from 10 up to 12 or 13 (it might be doubtful which). Would it be too much to say 200 attendances? At present education ceases for any effective purpose at 9, or even at 8 years of age, and he believed that nothing but compulsion will ever set it right.

The Chairman (in summing up) agreed cordially with the last speaker that the voluntary system had failed, advocated some tentative plan, such as compulsory attendance during the three winter months, which he thought would interfere very little with farm work.

The employment of women was then discussed. Few girls were stated to be employed in the fields, except with their parents, and then a very large number are required for the cultivation of hops and fruit.

The general feeeling appeared to be that interference was unnecessary, though a strong opinion was expressed by one employer against "ladder-tying" (women climbing ladders to tie the hops). Two gentlemen from Scotland condemned the employment of a woman at all, the one as preventing her from bringing up her family properly, the other as also hardening herself; but the latter added that, as carried on in this neighbourhood, he was not prepared to say that it was injurious at all. Two employers went so far as to say that the neatest cottages were those occupied by women who went to field work.

[For the above reports I am myself responsible.—E. S.]

---

78. East Kent Chamber of Agriculture.

Meeting at Canterbury September 5, 1868, the Hon. Geo. Milles, M.P., President, in the chair, and about 60 members being present.

The chairman introduced Mr. Stanhope, Assistant Commissioner, who explained the object of the inquiry.

Mr. C. J. Plumptre moved,—

"That no restriction be placed on the age at which "children shall first go to work, but that some means "be taken to secure their attendance at school during "a part of every year up to 12 years of age."

He referred to the farm servants and the difficulty of dealing with them. He therefore said you must deal with them while young. They ought to learn the three R's. But how soon can they learn it? In 3½ or four complete years of schooling they can learn to know all they want. But boys begin to work at 7 or 8, and at 13 or so they are taken into the stable. Then you cannot deal with them, night schools, in which he took a great interest, being not sufficient. Can you not, therefore divide the years between work and school up to the time at which they are taken into the stable? You cannot fix regular times for school or for work, but divide the year generally; say five months at school and seven at work.

Mr. R. Lake, Milton Chapel, seconded the resolution, and said, "that the mates are under the master, and he is responsible for them. Thought that agriculture don't want much help; the landowners are most interested in the question, and, looking back the last 15 years, the strides have been very great in this matter. Almost all parishes have now schools. Government interference is not new, and has done good very often, as in the case of the new Poor Laws, but is not applicable in this case.

Kent.
Mr. Stanhope.
g.

Mr. Dowker wished to see education improved. This ought not to be done by legislative interference, although schoolmasters ought to be provided for the schools by Government; hitherto they have been too dear. Proposed a resolution to the effect "That this "meeting recognizes the importance of improved "attendance, but does not approve of interference." (Subsequently withdrawn.)

If there is to be interference, let it be by not letting them go to work, say till 9 years of age: children kept at school up to 8 or 9 can learn quite enough.

Lord Fitzwalter said that the resolution did not necessarily include legislative interference. Did not like to pledge himself to any particular interference, but allowed that some alteration is necessary. Thought that the three R's would be sufficient.

The Mayor (*Mr. Austen*) considered the country schools have carried the education too far, but approved some compulsory measure to control the poor in educating their children.

Mr. Nethersole thought that no compulsory rates would answer.

The resolution was carried.

Mr. F. Neame, of Macknade, moved, "That this "meeting is of opinion that there should be no "Government interference as to the compulsory edu- "cation of the poor in agricultural districts."

Thought if they do their duty no compulsion is required.

Mr. Nethersole seconds it. Carried almost unanimously, there being two dissentients.

A vote of thanks to Mr. Stanhope closed the discussion.

79. Extract from Mr. Moncreiff's General Report on Kent. (*Report of Committee of Council on Education*, 1868, p. 203.)

Confining myself strictly to what is within my official knowledge, the state of those children who do more or less attend inspected schools, I have for years held the same language, that all our teaching was powerless for effective good so long as nothing was done to compel the attendance of children up to a reasonable age.

* * * *

Our main hindrance here is not absolute neglect, but the encroachments of juvenile employment. For the greater part of my own district the most interesting question is, the extension of the principle (not the details) of the Factory Acts to agricultural labour.

I trust it may not be long before a measure is passed to regulate such work as brick-making, and to place some restriction on the less tangible occupations of fruit-picking, hop-picking, and other miscellaneous harvests, as well as the desultory employments of watering-places. To most of these, I fear, the half day principle would prove inapplicable, on the ground that every child capable of the work is wanted at the same time. Yet I should be glad to see the question fully considered, having from my old Yorkshire experience more faith in half time than in any other expedient. If this may not be, it would not be difficult to devise a scheme for rendering steady attendance at school during the winter the condition of employment in summer.

The very abundance of work in summer might thus be made to help to secure a minimum of regular schooling. The minimum should be set high, not less than 200 half days in the year, so as to restrict the time of work to the months when it is really necessary. There should also be a minimum age, below which a child should not be employed at all. One at least of the above-named modes of employment—brick-making—would require separate consideration, and possibly stronger restrictions.

"Wanted at home" is the most puzzling of excuses. I should be content to leave it in the meantime to the indirect effect of such enactments as I have been considering.

For such a district as mine I do not think it would be necessary to take seriously into account the possible case of there being no school within reach. If the penalty for infringing the law is laid on the employer, the employers of labour in a parish will find means to maintain a school. A school to satisfy the Act should be under inspection, and fairly well reported of.

80. Extract from the Report to the Canterbury Diocesan Board of Education in 1868, by the Rev. B. F. Smith, Diocesan Inspector, and Vicar of Rusthall.

The extension of the half-time system to workshops by the Act of last year will probably affect some parishes in the diocese, and oblige the schools to adapt their arrangements to meet these new requirements. In view of this, and of the possible extension of some modified Factory Act to other industries, it has occurred to me that an alternative might be offered in lieu of the present requirement of half-time schooling, which might stimulate education while it was less burdensome to employers and parents. I propose that any child on presenting a certificate of having passed the fourth standard, should become free of all restrictions. By a regular and well-taught scholar this might be done at the age of 11. A premium would thus be held out to parents to keep their children steadily to school in early life, and to get them on with their learning, in order that they might be free from all restrictions on their labour two years earlier (at 11 instead of 13 years of age) than though they were dunces, and consequently be in greater demand, and able to earn better wages. You might thus lead as well as drive, and the former might prove the most effectual method of securing a minimum of education. At all events, by offering this alternative, the education of the country would be no loser, and, if we are to believe the accounts given of the attainments of half-time children in mills, it might be a great gainer; and in many industries it might soon become the custom to employ none but certificated children.

WEST KENT.

(A.) THE NEIGHBOURHOOD OF MAIDSTONE.

81. *Charles Whitehead, Esq.*, landowner, occupier, and magistrate, East Farleigh, Maidstone.—In this hop growing and fruit growing district a great amount of work is available for women during nearly the whole of the year, of a character more suited to them than that of many other districts; hence it will be found that a large proportion of women, quite 70 per cent. of the able-bodied, are employed in agriculture.

The pay of women's work in the Maidstone district is better than that which usually holds in other places. A deal of it is done by the piece.

The "gang" system is almost unknown; the writer has known a fruit buyer occasionally to bring a lot of women from a distance to pick fruit as a gang; and has known and heard of bean planting or "dibbling" being undertaken by a stranger, who has imported a "gang" of women and girls for the purpose; but these practices are luckily most rare.

In the hop picking, which is quite an exceptional time, a time in which everything is upset, everything else forsaken, when every man, woman, and child goes to the hop ground, shutting up each home, and when swarms of immigrants flock to every farm, the "gang" system undoubtedly holds to a large extent, but only as regards the immigrants.

The labour of both women, girls, men, and boys is squeezed out of them to the utmost limit by men who hire them beforehand and bring them to the scene of action; paying all expenses, feeding them

miserably, giving them, perhaps, a trifling sum at the finish.*

The work done by and available for women and girls during the various months of the year may be categorized as follows:—

——	Sort of Work.	Earnings per diem.
		s. d. s. d.
January -	Rag-cutting, done by piece, from	1 2 to 1 6
	Pole shaving, &c. done by piece, from - - - - -	1 2 „ 1 6
	Pole butting (for dibbing), from	2 6 „ 1 6
February -	Same as the preceding month; dibbing beans by day - -	1 0 „ 1 2
March -	Same as preceding month - -	1 2 „ 1 4
	Couching, and in some early seasons helping men (on their own account) to carry poles on and dress hops (or cut them)	1 0 „ 1 2 1 4 „ 1 8
April -	Same as preceding month generally.	
	Thistle spudding in wheat generally, by day.	1 0 „ 1 2
May -	Same as preceding.	
	Hop-tying, done always by piece	1 10 „ 2 2
June -	Hop-tying as above - - -	1 10 „ 2 2
	Thinning mangolds (day) -	1 0 „ 1 2
	Early fruit, day or piece - -	1 4 „ 2 6
July -	Picking cherries, gooseberries, currants, &c. by day or piece	1 4 „ 2 0 1 2 „ 1 8
	Hay-making by day, sometimes with beer.	1 0 „ 1 2
August -	Picking later fruits and early apples by day or piece.	1 4 „ 2 0
	Harvesting on their husbands' accounts, or friends' accounts. *Not employed by farmer actually.* Estimated value.	2 0 „ 2 6
September	Harvesting, as above - -	2 0 „ 2 6
	Hop-picking, at so much per bushel, or at so many bushel to 1s., depending upon crop, &c.	1 6 „ 4 6 or even in rare cases 5 6
October -	Hop-picking as above (average of this is one month's duration)	1 6 „ 4 6
	Picking up potatoes at per day, &c., acorns, &c.	1 0 „ 1 2
November	Couching after sowing wheats, &c., pulling marigolds and turnips (*the worst and almost only unfit work done by women.*) Day work.	1 0 „ 1 2
December	As the preceding - - -	1 0 „ 1 2
	Occasionally cutting dead fruit for their husbands, say.	1 0 „ 1 4
	Rag cutting, (piece) - - -	1 2 „ 1 6
	Pole shaving (piece) - -	1 2 „ 1 4

The above category comprises the usual routine of work done by women in this part.

Most of the work is easy, and suited to females. The ladder climbing for cherries and apples is dangerous and inappropriate; its remuneration is higher usually, as is shown by the list. The carrying on of heavy poles is not suited for women; but that is done by their husbands' or fathers' wishes, and not by the employers'.

The mangold and turnip pulling should be dispensed with as far as women are concerned. It is a wet, dirty, nasty job.

There are other things done by women, such as sack mending, hop pocket making (done at home), mending "pokes" and bin cloths, which are nice jobs, and are paid at from 1*s.* to 1*s.* 8*d.* per day.

* The remaining evidence as to the hop-pickers is collected together and will be found at the end of the other evidence from Kent. I would call especial attention to it.—E. S.

The hours of work for women are from 8 a.m. in the morning to 4 p.m., 5 p.m., or 6 p.m. in the evening, according to the season, with an hour for dinner. So that they have time in the morning to tidy their homes, &c. &c. before going to work.

They generally take Saturday for home work and for marketing.

It is very unusual to see a girl under 15 in the fields, except in *hopping*, when the whole family, baby and all, goes forth.

The usual day wage of a woman is from 1*s.* to 1*s.* 3*d.* per day, and 2*d.* per day less for girls under 19 or 20.

Women's earnings are here a great help to a working family, especially in summer; hop picking is looked forward to to pay off old debts and rents, and the woman here is the chief contributor.

The winter work is not so abundant nor so much sought for as the summer work, and is chiefly done by the elder women.

As a rule women's work in Kent is not inconsistent with health, morality, nor with the general well-being and social state of the agricultural labouring community.

Boys.

Boys are rarely employed here, as a broad rule, until 11 years of age. And they are not essential to the farmer at that age even. It is often at the wish of the parents that they are kept to work then, at rook minding, &c.

After 12 or 13, in some periods of the year, they are necessary, as for leading horses, looking after sheep, &c. &c.

No boy should be taken to work, properly speaking, until he is 12 or 13 years old. It is impossible for him to read, write, or cypher, even fairly, so as to be able, at least, to apply his knowledge to any practical use, until he is 12, and only at that age in rare cases.

He may, for what advantage he is to the farmer, stay at school until he is 12 or 13, and then his education should be carried on by night schools, as regularly kept going by Government as day schools are.

No half-time system of education, whether it be half-yearly, or half daily, or of alternate weeks, can work. Half the time would be taken up in getting out of old habits and in getting into new, in forgetting and learning *de novo* to wield the pen and to hold the spade.

It takes a long time to settle down to a fresh mode of life, and a half-time system of education would undoubtedly make the lads unfit to get their daily bread, and at the same time practically unable to benefit by their slipshod educational acquirements.

Night schools, to supplement day schools to carry on their work are the only means by which rustic lads can be educationally improved, consistently with their first grand object in life, viz., to get their living.

Cottages.

Cottages in this part are bad generally and insufficient in number.

Their accommodation is generally miserable, especially as to bedrooms; it frequently happening that boys and girls sleep in the same room, lads and lasses also; fathers and mothers and big children also, in very many cases, occupying the same rooms.

They may not be worse than in other counties, but they are emphatically bad.

No decency can be observed in this kind of bedroom arrangement, and it is difficult to see how chastity and virtue can be inculcated under such circumstances.

The sitting rooms are deficient in comfort; too often stone or brick floored, draughty, cold, wretched places, from which the father and grown up sons are only too glad to escape to the warm public house near.

The sanitary arrangements are horrible; and, in

Kent.

Mr. Stanhope.

g.

short, the cottages of the working man are so curiously contrived as to sap the foundation of morality, religion, and health.

In many instances, working men have to walk miles before they begin their daily wage paid work.

There are not enough houses in most villages, consequently the workmen must live in towns or far from their employment.

The old Poor Law was an obstacle to building cottages, but that excuse is gone now.

It is intended to introduce a Cottage Building Company here, to buy land in villages deficient in cottages and to sell them to tenant farmers or to working men (to be paid by instalments) themselves.

82. Extract of Letter from the Rev. W. J. Edwards, Incumbent of St. Peter's District, Maidstone, dated August 10, 1868.

"There are four steps in the culture of hops, in which women and children (girls) are more or less employed; besides others in which they are not employed. These four steps are, dressing, poling, tying, and picking.

1. "Dressing." This is done in the early part of the year, while the land is yet wet from the snow and rain of the past winter; it consists of moving the earth from each hill, so as to uncover the top of the root, and then entirely cutting off all the stems of last year's growth, and, lastly, drawing the earth back so as to "heal" or cover the root or hill again.

This is hard work both for girls and women, as the earth is heavy, and they are liable to get their feet wet, except in very dry seasons.

2. "Poling." The hop grower contracts with the labourer to "pole" so many acres, at so much per acre, and then the labourer employs his own wife and children in "laying out" the poles, so as to be ready for him to put into the holes which he has made or "pitched" with an instrument called a pitcher. Sometimes the women pitch the holes.

3. "Tying" the young hops to the poles with pieces of rush or sedge is tolerably easy and light work for women; but it requires some care, and therefore children are not so much employed. But all these interfere more or less with their attendance at school for all the spring of the year.

4. "Picking" the hops is regarded as a general holiday by all classes.

83. The Earl of Romney, Mote House, Maidstone.

The state of opinion with regard to supply of cottages seems to me unsatisfactory. Many consider it only in a charitable point of view and blame any one who asks rent for a cottage on the same principle as for any other property, viz., fair return for the cost of building it. The effect of this is that people are deterred from building cottages. I believe this arises from the transition state of paying wages to agricultural labourers; formerly they were for the most part servants living in the farmhouses, afterwards they were put into cottages built near the farmhouses, for which they paid no rent and had additional wages in lieu of board. As population increased, and land, better cultivated, employed more labour, and the large proprietors not receiving remunerative rent for the cottages avoided building, then carpenters and small tradesmen built them on parts of manors or small parcels of land and were much abused for charging what were called high (but were really fairly remunerative) rents, and to this day it is often said "How can a man with a family pay such a rent?" Now in these days a labourer may, as a rule, obtain sufficient wages to enable him to supply himself with what is necessary, be it house or other want, and if he cannot in a very short time the employer will be obliged to pay him enough. And it is a much sounder system that he should receive fair remuneration for his labour and pay fair rent for his cottage than be underpaid for his labour in consideration of his being under rented.

I do not see the necessity of giving the tenant farmer control over cottages. I like to have the final appeal in myself, and in two cases within my experience I have found the advantage of being able to protect a labourer. Practically I give the tenant the absolute nomination; even if the cottage is under his control, he could not get rid of his man under a week's notice, and I give my agent full authority to act when I am absent in dismissing the occupiers, when necessary.

Although the earnings of the labourer are very high at some seasons from the quantity of piece-work, I do not think that the high wages have added to his independence. He is quite ready to live very well most of the year, and apply for relief for a week or two, if he is out of employment. I should like to see Boards of Guardians exercise their power of making loans to be repaid by instalments; in some instances our Board has been induced to do so, but they have been easily turned from their purpose of enforcing its repayment.

84. The following is from a lady living in the neighbourhood of Maidstone.

For several years I have assisted in a night school held in this parish. We have made great efforts to obtain the attendance of the farm lads, called in this county "waggoner's mates." They hire themselves out from year to year, and are an extremely ignorant class. Many, if not all, have been to school, but have forgotten nearly all they learnt. One lad came to the night school at 17 years old, knowing very little more than his alphabet, though his parents declared that he left the day school at 11 "a good scholar." This entire forgetfulness of the knowledge acquired during a rather desultory school life is not surprising when it is considered that a boy of 12 who becomes a "mate" has usually no opportunity of keeping up his learning. He works from 6 a.m. to 8 or 9 p.m., and is entirely under the control of the waggoner, almost invariably an utterly ignorant man. Very few farmers will interfere to make it possible for the mate to go to a night school, or even to see that he is allowed time to attend a place of worship on Sundays. Often the hours for feeding the horses are so arranged that it is quite impossible for the lads to get away to either school or church. Under these circumstances they soon degenerate into mere "louts," and even when, as sometimes happens, they leave farm service after two or three years of it for some other occupation which affords greater leisure, they have generally become so be-dulled that they have lost all desire to improve themselves. On the other hand, if they remain as "mates" till they are old enough to take the place of waggoner (which is most frequently the case), they have not even this tardy chance of regaining the little learning they once possessed. I know seven men in one hamlet who cannot read, all of whom have had the opportunity in their childhood of attending school.

What is required is a certain amount of attendance at day schools till 12 years of age, after that a night school. Assistance to multiply night schools, rather than to make them very good, would be most valuable. Several small evening schools, even though taught by inferior teachers, would be far more useful in a large parish than one central one, held by a certificated master. How can a boy or man walk two or three miles to school after his day's work? Even if they were willing, it would be unreasonable to expect the farmer to spare the mate not only for the hour and a half's schooling but also during the time his walk to and fro would take.

Big lads and grown men much prefer voluntary teachers, (and any, whether paid or not, who will consult their feelings a little,) to highly trained masters, who are too apt to treat them like children, and put them through a strict routine, which they dislike very much.

I think *all* night schools should be assisted on the "payment for results" principle. There is often a difficulty in providing school materials for them, and

young men are set to learn reading from the childish books proper only for the day school, because there are no funds to furnish suitable adult reading-books.

The rule in the Revised Code, by which no grant is given for night scholars above 21 years old, is a direct discouragement to the education of those who most need it.

There are 58 "mates" now in this parish (pop. 2,300), between the ages of 12 and 17. In this, and the neighbouring eight villages, I have calculated that there are as many as 300.

The most certain way of improving the condition of this class, would be to make attendance at the night school compulsory, if possible up to a certain age. I believe nothing else would make the farmers exert themselves to arrange that the boys employed in horse and cattle-feeding should be spared to attend. I know it has been objected that evening schools are not so universally established, nor so regularly maintained as day schools, but I think this would soon be remedied. Suppose that an Act was passed that no boy who had reached the age of 14 could be employed on a farm, without having passed a certain examination (say the 3rd Standard in the Revised Code). If this was thoroughly made known, it would at once become the interest of the masters, the parents, and the lads, that they should be qualified to pass this examination. If there were no regular night schools near enough for the boys on remote farms to attend, the farmer, under pressure of necessity, would look out for some young man who had received a good education, to act as schoolmaster on the winter evenings. Thus humble evening schools would soon be set up all over the country. I believe this would be quite practicable, and that, by such rough means, a more ignorant class would be effectually reached than under the present system. Of course, such a plan would require some years' notice before it could be put into practice.

During the last year, children have been taken away from school to work much earlier than usual. The young ones do not generally go to work before haymaking, but this year they began several months sooner. It is attributed to the high price of provisions. One curious proof of the small things that will make the working people keep their children away from school is that when they are accidentally prevented from going on Monday or Tuesday, the parents will often keep them at home the whole week, saying that it is not worth while to pay the schooling money for three or four days.

It is an almost invariable rule here that when a farmer lets a cottage to a labourer, his wife is to do the hop-tying. I have known some turned away because they would not.

Field work is certainly bad for the women, it roughens them, causes them to neglect their home and children, and is of very little profit in the end. There is the greatest difference in the character and appearance of those children whose mothers stay at home, compared with those whose mothers are constantly engaged in field work. Moreover, in the latter case, the education of the elder girls must suffer.

---

85. Extract from Letters from the Rev. T. O. Blackall, Vicar of Seal, near Sevenoaks, dated October 5th and 7th, 1868.

1. Ample provision is made in this parish for the education of the children of the poor.

2. Notwithstanding this a considerable portion of the poor population is still growing up without elementary knowledge, and without moral training.

3. And this is owing to the following three causes:—

A. The indifference of the parents.

B. The early employment of children in such pursuits as agricultural labour, cow minding, fruit gathering, and going of errands, &c.

This employment begins in some cases as early as 8 years old, and in the majority of cases (of boys) is not postponed beyond 10.

The effect of this employment of the young is partially to displace adult labour, which during portions of the year remains idle.

C. The employment of females in agricultural work, such as swede-pulling, couching, and hop-pole shaving, which detains at home very young girls to take the mother's place.

4. No excessive distances are travelled to points of labour.

5. Adult labour is adequately paid, but children are employed occasionally at low rates.

6. In my opinion the best mode of obtaining for the children of the agricultural poor a fairer chance of elementary training and preparation for the duties of life, would be to require of children under 12 years of age, as a condition of employment, either a certificate of so many hours' attendance at school, or a certificate of school proficiency. And to enforce the above by penalties, not upon the parent or the child, but the employer.

The difficulty of bringing compulsion to bear might be met by requiring schoolmasters to furnish two tables to persons appointed to receive them, (1) containing a list of all children between the ages of 8 and 12 of the agricultural class in the school district, who have been absent during the months of November and December, without special employment; (2) a list of all children of the same age and class, who have been absent at the same period owing to employment, specifying the name and residence of employer.

A summons to be taken out by the local policeman, either against parent or employer, according to the cause of default, and the magistrate to be empowered to inflict a fine on the second offence. Over 12 and up to 14 I would require during the same months 50 nights or 100 hours attendance at a night school.

86. *Mr. J. T. Hatch*, land agent and large occupier, at Lenham.—I see nothing objectionable in the mode of employing women here. We could not do without them in hop districts, and I do not think such field work as they do here leads to ill-kept houses or neglect of household duties. I do not like, however, to see women fruit-gathering on ladders, nor working with threshing machines. It is hardly decent for them, and such work appears to me to roughen them. But it is not usual to see them so employed in this district. Girls are very little employed directly by the farmers, except at a little thistle spudding. They go with their mothers to hopping and hop-tying.

I find very young boys useless, even for rook keeping. It is not often worth while to employ them at all till they are able to earn, say, 4*s.* a week. They would not be wanted regularly before 12 years of age or upwards. I don't like pressure of any sort in the matter of schooling. Nothing will do any real good till they get to see the advantage which is gained by education.

An able-bodied man of average skill and his family will earn 50*l.* a year at the least. But they are not really independent. The poor law has a tendency to pauperize them most unnecessarily. The least illness, the confinement of the wife, or anything of the sort, sends many of them to the "parish" for relief, and I believe if out-door relief was given as lavishly and with as little inquiry in the metropolis as it is in rural districts, the fabric of the existing Poor Law would break down in three months. Labour is fairly distributed in this parish and neighbourhood. The population is decreasing, and, therefore, the cottage accommodation is becoming more sufficient. But, as a rule, the landlords are set against improving cottage accommodation, and very little change for the better is taking place. Cottages are often allowed to go into such a state of decay as to be uninhabitable, and, becoming so, are then put in order for a new occupant.

Kent.
Mr. Stanhope.
g.

This part of Kent used to abound in heaths or commons, and many hovels have been run up by squatters, which are very unfit to live in.

There are as yet but few cottages on the farms. I don't think the men object to it, so long as they are let alone; but they are very jealous of any interference, and don't like being patronized by too inquisitive ladies.

87. *Mr. Thomas Hayes*, farmer and guardian, Boughton, Maidstone.—We want you to understand that we are not opposed to education. Enlighten a labourer reasonably, but don't let it be only book learning. If you prevent his being employed under a certain age, you hinder his being taught to get his living. A boy that is going to be a clerk is learning how to live when he is at school, but one that is to be a farm labourer is learning what is a luxury to him. No limit should, therefore, be put to the age at which boys are employed. It all depends on a boy's growth when he is capable of doing the work. A little chap of 8, or even less, may be useful. I have a lot of from a dozen to 30 boys and girls, and a few women to pull 'kilk' (ket locks) and weed corn. I send a man with them. I could not get enough women to do it, because there is so much here for them to do. I pay them all by the day.

We think four cottages are wanted to every 100 acres here. As a rule they are let with the farm; but there are exceptions, and the exceptions are increasing. We much prefer their being let with the farms. In many places there is still a great want of cottages. The result is that many are run up by large speculators and let at a high rent. They build them in rows, which I find to be a very bad system, because one idle woman affects the whole row. Gardens are now given with all the landowners' cottages. Allotments are dying out. I think 40 rods is quite enough for a garden. We don't approve of pigs. They are almost always kept at a dead loss, unless they are near a big town, and very many fewer are kept now by the labourers.

[These opinions were indorsed by several other farmers, who heard them read over to Mr. Hayes.—E. S.]

88. Mr. Whibley, of Sevenoaks, Mr. Turner and Mr. Stoneham, of Kemsing, in a conference with the Assistant Commissioner at Sevenoaks in July 1868, agreed that moderate education is sufficient; the difficulty is forgetfulness. Mr. Whibley's two best men can read and write, and they are his only men who can. Mr. Turner says he can find half-a-dozen who could read and write well, who have forgotten it all. Mr. Turner doubts whether (especially in frosty weather) boys of 10 are not most wanted in November and December. The others say they are never wanted in winter up to 12.

89. *Rev. S. Hornibrook*, curate of St. Faith's Mission District, Maidstone, and Hon. Secretary to Maidstone Cottage Improvement Company (Limited).—A considerable number of agricultural labourers, quarrymen, and brickmakers live in Maidstone, and work in the parishes round the town. By the census of 1861 the number of agricultural labourers resident in Maidstone is returned as 153 under 20 years of age, and 569 above that age, and probably an equal number of brickmakers, quarrymen, and other such labourers now reside in the town. Many men walk 3, 4, or even 5 miles to work at Burham, Aylesford, and other places, where there are not a sufficient number of cottages, and some have to start soon after 6 a.m. The nature of hop cultivation, pottery work, and brick-making, seems to require a large amount of labour at certain times, but even in the dead season of the year much work would perhaps be found for men resident on the spot, whereas now employers care nothing for men who live in Maidstone, and are a burden to the charitable inhabitants of the town for 8 or 10 weeks of the winter, being in wretchedness themselves, and absorbing much of the assistance which ought to go to the town labourers. The accommodation for farm labourers is very bad, the rents in Maidstone being high, and the supply of small cottages limited. Many of the cottages in which they are forced to reside have no back yards or separate water-closets. Many cottages are occupied by two families, and some are let out in single rooms occupied by whole families, and charged for at the rate of 3*s.* a week furnished. Women earn a good deal by hop-tying, hop-picking, and fruiting, but the want of decent accommodation and of garden ground prevents labourers from rising above wretchedness. In the district of which I am curate the charge for schooling has had to be reduced to 1*d.* a week, and among the residuum of the population of the town with which I have principally to do, many children are kept from school in the winter for want of clothes and shoes. Four years ago a cottage improvement company was established in Maidstone. It now owns 54 cottages, has a capital of 4,200*l.*, pays 5*l.* per cent. per annum, and has a reserve fund of 200*l.* Much good has been effected, and the cottages are well kept, while other owners have also been stirred up to improvement, and in one instance a property which consists of 86 cottages has now been repaired, and partly rebuilt by the owner, who refused to sell when asked by this company to do so.

90. *Mr. Frederick Duly*, relieving officer, Maidstone.—Women find here a great deal of work in the hop gardens and orchards. The work to which I object for them is the 'fruiting,' in which they have to climb ladders to pick the fruit. Two fatal accidents occurred here last year from this cause, and it certainly appears to me to be a dangerous work for them. So much work is there for them that the institutions which seem to be most needed are schools where children can be left all day, so that the mother is free, and the eldest daughter is not so much required at home to look after younger sisters. In Canterbury, where I was relieving officer for some time, the provisions of Denison's Act, enabling guardians to send the children of those receiving out-door relief to school, was carried out and worked well. Every week the parent had to produce to me a certificate from a schoolmaster of attendance at school, and no excuse but illness was taken for non-attendance. Here, in one case, owing to the pressure of Mr. Balston, an increased relief was given for the same purpose, and the mother produces a quarterly certificate of her child having attended school. The following was our Canterbury form of certificate:—

'Canterbury Incorporation.

'The guardians of the poor being desirous of 'ensuring the regular attendance at school of the 'child named below, solicit the kind co-operation 'of the [master] of the national school by filling up 'this card weekly, notifying the daily attendance at 'school of such child.

'F. D., relieving officer.'

James White, No. 40 on Relief List.

This card is to be shown to the Relieving Officer weekly, on relief days.

Week ending.	M.	T.	W.	T.	F.	S.	Sig.
—	×	/	\	a	×	\	E. W.

The great evil we have to complain of here is drunkenness, and the club is a common plea for getting to a public-house.

91. *Mr. Day*, scripture-reader, Maidstone.—My work lies a great deal among the very poor in this town, many of whom are irregular farm labourers, driven to this occupation out of brick-making and other work. This has been a bad year, not 'a poor man's summer,' as they say, because of the drought. The difficulty, therefore, of getting them to pay 3*d.*

a week for a child's schooling is greater than before. If they once fall into arrear, then the child is kept away altogether rather than pay up what is owed. The restrictions of a regular day school have a tendency to keep them away altogether. Mothers often want their children half a day, or for an hour or two, and at some of the schools, if they become at all irregular, they are struck off the books altogether. For this reason they will often rather pay 4*d.* and 6*d.* for sending them to a dame's school. Shoes and stockings are, however, the great obstacle, and the want here is a ragged school. I have several times tried a night school, but never got more than 13 to come to it. One reason is that they want a regular 'unbending' in the evening. The family meal is a supper, which takes place just at the time when the boys would be coming to night school.

WATERINGBURY.

Population 1,370. [Acreage under hops, 370.]

92. Notes of Meeting August, 1868.

PRESENT:

Rev. H. Stevens, Vicar.
Mr. Thos White, } farmers.
Mr. E. T. Goodwin, }

Women are employed all the year in many cases and take their children, but no girls under 11 are employed and boys are not really wanted at that age, except at hop picking. Sometimes a few boys or girls of 8 or 9 are employed at weeding for a week or two, but this is the exception. Both for women and children field work is considered healthy. The women work from 8 to 6, with an hour and a half for meals; the "mates" with horses have longer hours, but, by an arrangement of staying longer one day and coming later the next, the hours of work are reduced to 12, and this being a hop country, fewer mates are wanted than in a corn growing district.

Children, both boys and girls, leave school earlier than they used, as there is a greater demand for them. The boys remain pretty well till 11, and it is thought that any compulsory restrictions beyond that age would be a serious inconvenience in farm work, and still more to poor families. Before that age, a requirement of at least 100 days' schooling in the year would not be thought unreasonable.

HUNTON.

Population, 935. [Acreage under hops, 510 out of 2,061.]

93. *Henry Bannerman, Esq.*, landowner and occupier.—This parish being almost entirely under hops and grass, few young women and children are hired directly by the farmers, but are taken by their parents to help them in their work. At hop-tying alone, a woman with children will earn 3*l.* or 4*l.*, and 'hopping' and haymaking will add a good deal to this. I have known a young girl of 16 or 17 earn 4*s.* a day at hopping, and the average would be from 2*s.* to 2*s.* 6*d.* a day. As to the men in my employment, they get so much piece-work that I calculate their wages at 19*s.* a week, taking the whole year together.

About 11 or 12 years old boys get employed with horses and are then wanted regularly; before that age a farmer does not hire them, but they are so much wanted by their parents that it would be impossible to require from them regularity of attendance at school.

YALDING.

Population 2,076; acreage under hops, 1,067 out of 5,804.

94. *Rev. E. Baines*, vicar.—Young children go with their parents to work here. Boys will begin at 7 years old, girls about 9, so we take 8 to be about the average on the whole. Their work will consist of hop tying and picking and pulling 'twitch,' in fact such work as the women do, which is all light and easy. Formerly the women did the 'poling' (sticking the poles in the ground) which was much too severe, and several cases of rupture were caused, but this is practically given up now. Their work is sometimes paid by the day and sometimes by the piece; when by the day they usually go out after breakfast and work till 6 p.m. Their general health is very good; cleanliness is the rule among them in spite of the bad cottages, and in consequence they are free from all diseases resulting from neglect of this. The shape of this parish is like a starfish, and my national school, under a certificated master and mistress, not being within reach of all, I have founded another under a trained mistress, so that with them and the schools at Collier Street and Paddock Wood (both districts carved out of this parish), no children have to go more than 1½ miles to school, except those living in a small outlying place called 'The Moors,' which contains a few cottages.

We have a night school, including 56 lads, which does good. But the only way I can judge of the knowledge of the growing population is at confirmation time, which has happened three times to me here. The greater part of them have forgotten how to read, except with considerable effort, and it is hopeless to expect them to explain words.

I tried a reading room for them, charging 1*d.* a week; at first I got 24, then it gradually declined to 2, and I gave it up. Next I tried a lending library, but some books were lost and others ill-treated, and it has not prospered. At the same time I think the labouring class are beginning to find out that if they get tired of farm work they can only get on elsewhere if they can read and write.

LINTON.

Population 613.

95. *Rev. T. G. Carter*, vicar.—The girls do not work at all except at hop-picking. They would not be trusted in the orchards. Boys get work about 10 years of age. Women will work more here than in any place that I have ever seen. Hop-tying lasts a long time, so they keep on tying till the hops are out of their reach. Then there is the fruit gathering. Picking cherries is women's work, because the trees are strong and can be climbed, but apples are picked by men. Some few work in winter at chopping manure, though they dislike it as a rule. I see less objection to women's labour as carried on here than anywhere else, as they generally work alone without any men being with them. Sometimes a man is wanted with a ladder, or to pack the fruit, but as a rule the women are almost alone. The women are, in fact, compelled by the farmer to go out. It is a healthy life and on the whole they like it, though one sometimes hears one say that one has things to do at home, which she is unable to do.

Evidence of the Labouring Class.

96. (*a.*) *Mrs. Stickins*, bailiff's wife, Loose.—Women working here can earn a great deal of money, besides assisting their husbands at 'poling;' a wife with a boy can double a man's wages, at least, by getting the poles ready for him. Mrs. D. (a neighbour) has never been at home a single day since hop-tying began, that is from April to August; she would be earning 15*d.* a day most of that time. Mothers take their children to help at about 8 years of age; such children would get about 6*d.*, never less now. But besides this, young children are sent to pick up sticks in the orchards or to keep birds off the fruit. Very young ones can pick up potatoes or pick hops, and by the time they get to 11 years old they are very useful on large farms, but we can't get regular work for them here. I have seen what we call a 'gang;' one of the farmers here has one of 20 children with a man looking after them. None of them would be more than 12; some of them are girls sometimes. They are paid by the day. When I was young I could 'tie' two or three acres of hops at 13*s.*

Kent.
Mr. Stanhope.
g.

an acré. Lots of women will do that. I don't see any harm in their going. Mrs. D., whom I told you about, does washing too; she will earn 3*s.* a week at that.

(*b.*) *Mrs.* ———, labourer's wife, Loose.—Women do a deal of work here. There's 'dressing' hops in March. But I'm a dunce, you know, about the months in the year. Some often go 'ladder-tying' hops that's strong, but I never could carry a ladder. There's less work this year. The drought throws people out of work because there's no weeds that grow; no children are wanted to pull up weeds. As a girl I used to go 'couching;' I am a dunce; there wasn't no school where I was; there is not half the work there used to be; we used to be always at work. I used to go 'couching' and shaving hop poles. But I took care I didn't do it longer than I could help. I went to service, I was 11 then. I've always regretted not going to school; my children all go. My husband goes with the horses so my children don't get so much work out; there is no one to take them. My boy (William) didn't go till he was 10, then he went altogether. He's no scholar; he's a bad boy, would never learn, no schooling is any good to him. He could write nicely when he left school; he can read, but he cares nothing about it, he doesn't learn a bit what it means. My boy John (13) is good enough at reckoning, but he's no scholar. My husband belonged to the club here; but they 'shared out' as they call it, and it came to an end. We wouldn't belong to the Foresters, you must be much grander to belong to those clubs. Now my husband's club is next Monday; we have two months to pay and three deaths. Its fearful.

(*c.*) *Mrs.* ———, labourer's wife, Ash.—At hop-picking we don't know here what we're to get till it's done. No more we do at cutting wheat and barley. They don't know what they're working for, and it makes a man very much hardened and dissatisfied. My husband works all the year round on one farm, so he hardly dares say anything; but the men who come to cut the corn don't like it. The farmer always tells us he will pay what others do, but we should like to know what we're to get. My husband wouldn't be in a cottage on the farm. The least offence and you must be out of the house; and then the women 's compelled to work. I go when I can myself, but I'm not fit to go this year. I don't think the money you get pays you for the work, or for the clothes, or for the beer you must have; and there's some work there's no business for a woman to do. There's winter work among the turnips no woman ought to go to. In summer we go from 7 till 6. The charity schools is no help to a woman that goes to work. The children don't go there till 9, leave at 12, leave again in the afternoon; and what are the poor little things to do if the mother's out? I must pay 3*d.* a day for these hours for the two children, besides the 1*d.* for the schooling. We want some one to take care of them all day.

(*d.*) *Mrs. Thompson*, labourer's wife, Earl Street, Maidstone.—My husband used to work at Otham, and lived there; about seven or eight years ago removed into Maidstone, and for two years we have lived in this room. My husband goes anywhere to work when he can get it. Sometimes six miles, often two and a half or three; going to and fro is worse than the work to him. We have this room and a closet for the boys, that is all we have for five children and our two selves. We pay 3*s.* 6*d.* a week, but they give us the furniture. My oldest boy is 16, and the oldest girl 15; they went with their father for a fortnight harvesting to Sittingbourn, and got 7*l.* by it. It costs us a deal more to live here. In the country we should have a garden, and perhaps a pig; now it's a very slack time before hop-picking, and in winter, because my husband can't get regular work, but the worst is the distance he has to go.

(B.) THE NEIGHBOURHOOD OF CRANBROOK.

97. *Mr. George Neve*, land agent and large occupier, Sissinghurst Castle, Cranbrook.—As a rule, few boys are wanted by the farmers under 12 years of age. A few younger ones would be employed a little in the summer, and in frosty weather in the winter would be useful for leading carts. But there would be some hardship in the case of orphans or large families if no work were allowed up to 12 years of age, unless power were given to Boards of Guardians to pay for the schooling of the children in any case where the family is very large. It is becoming more and more difficult to get 'mates' (boys to go with horses regularly). They don't like the long confinement. I tried for some time the plan of having a 'horsekeeper,' and then I only wanted the boys during the day, and not to look after the horses at night. But this can only be done where a large number of horses are kept, and another great difficulty in carrying it out is the opposition of the waggoners, who by this means earn less wages, and have not the same control over or the same interest in their horses. But boys ought to go young with horses, and we find that the best 'mates' are those which are 'carter-bred,' that is, the sons of waggoners who are brought up among horses. The wages here vary a little according to the hours, which differ in adjoining villages, men who work from 6·30 to 6 getting more than those who work only from 7 to 5. The latter class are increasing in number. Cottages are not yet very well distributed in this neighbourhood. A good many men have to go as far as three miles to work, but this is gradually being remedied. I have been concerned in building some with money borrowed through the Enclosure Commissioners. It is a great question whether it is worth while to go to them, as they are so strict in enforcing certain rules that it is both troublesome and expensive. Most of the new cottages have three bedrooms, and if for no other reason I should strongly urge this on the ground of its shifting the responsibility from the shoulders of a landowner, and if he enforces rules against taking in lodgers, he has done all he can. Some more efficient inspection of cottages is, however, necessary, and the only means of getting an inspector to do his duty is to appoint some one entirely unconnected with the parishes which he has to inspect. I think that a tenant should have the control of the cottages on his farm, and I believe that such a power would be very rarely abused. But some restriction should be made as to the getting rid of the occupier of a cottage. No man ought to be turned out under a month's notice, and then his garden ought to be considered, though it is not at all uncommon for the crops in a cottage garden to be paid for by the incomer. The size of garden I allow is 20 perches. It is a common condition made with a labourer in letting him a cottage that his wife and children shall work when required.

98. *Mr. Francis Allen*, schoolmaster of national school, Cranbrook.—Out of 124 boys on the books of this school, 89 belong to the labourer or agricultural class. The other 25 are the sons of mechanics, or a class just above labourers. The average number of attendances last year was 126 days nearly. Only five boys were over 12 years of age, and not one of these the son of a labourer. 35 boys over 10 years of age had to pass in the 4th, 5th, and 6th grades, but few of these were of the 'labourer's class.' The children of labourers are employed in the fields for about four months in the year. From October to February, inclusive, we have nearly 12 months' work to do, as the continual breaks in attendance do away with the work done in the casual attendance. Very few boys belonging to the class of agricultural labourers stay in school after they are 10 years old; but some few come occasionally in the winter for a few months till they are 13 or 14 years old. A great many of the poorest in the town never learn to read at all, either from their parents' negligence or poverty, or because they are sent to work too early.

[That these exist in any number is doubted by the vicar, and Mr. F. Hollands, overseer, says, "a "great many children are able to read, but not able "to understand what they read; there is a dulness "of intellect among them."—E. S.]

Evening schools do not prosper here; only 14 out of 30 were last winter of the poorer class, and they attend very irregularly. After a few nights they seem to tire, and only a very few learn to read, write, and cipher fairly. Most of the lads between 14 and 18 read but imperfectly, and cannot write sufficiently well to write a letter to their friends.

99. *Rev. T. A. Carr*, vicar.—We have tried a plan here in substitution of an industrial school. Girls in the first class of the school get 'Saturday place,' as we call them. It is a holiday at school, and they go for the day to assist in doing the household work at some house in the town. The people here are very willing to take them, and we find it very useful.

100. *Mr. F. Hollands*, relieving officer.—Denison's Act has been made use of in this parish, but we can't apply it except to the cases of permanent relief. Where temporary relief is given, we can only keep the child while the relief is actually being paid, and I look upon this as a defect in the Act. It is hardly made use of in any other parish. At Frittenden I pay for four or five. Here I pay for more than 20 children. This is only done when the parents express a wish, but I have been anxious to encourage them in applying for this assistance. The proof of attendance required is the production of the schoolmaster's bill, though in one case I produced to the chairman of the board a table of their attendance. I don't think there is so much unwillingness on the part of parents about sending their children as carelessness, because they can get some money by it, and they think they inure their children sooner to field work. The great incentive to them would be if they could see that their children got on in worldly prosperity by it. Few would aim at education, except for this object, though this applies more to the boys than the girls.

101. *Mrs. Jenner*, labourer's wife, Cranbrook.—It is very often that women are driven out by the farmer. It is a rule when they take a cottage. I think it is quite right. Women ought to go and do women's work and help their husbands, and not stay at home. I have taken my daughters out at 6 years old to hop-tying. When I was 8 years old I tied three acres myself. They would give me a dinner every day that I should keep up. I was very quick at it. Now I can't do so much, but I and my daughters tied five acres this year. I go to ladder tying too. I go and do more than a man would, and yet they give 1*s.* instead of 2*s.* 6*d.* I work from 8 till 5. I had rather work by the piece, but they won't have it. I took my boys away from school at 9 or 10 years old. They are not much scholars. They got great boys and wouldn't go, because they didn't like it. My boy Henry went to a night school, and he got to write, and can write me a letter. The thing we want most here is a garden. Years ago we used to have one. I should be very pleased to have one now. It would make a difference of 1*s.* a week to us, I should think. I should like a quarter of an acre. I could soon manage that myself.

BENENDEN.

Population - 1,662.

102. *Mr. George Landsell*, large occupier.—In this district no fruit is grown, but a great many hops. This gives employment to a great many men and boys in summer, for whom it is difficult to find work in winter, although there is the additional job of wood cutting, to which many men go with their wives and children. Girls we never employ, though their mother will sometimes bring them, but young boys are often wanted for a few weeks in the spring. The success of hop growing has led to an increase of the crop, and, therefore, to a greater demand for labour. Nearly all the women who are inclined to go can get work almost regularly in the summer, but exceptional work only in the winter. These women would add from 6*l.* to 7*l.* a year to the husband's earnings. We keep more men than necessary in regular work, in order to be sure of them at certain seasons, and of their wives and families also. In consequence of this, all my men could average 16*s.* to 17*s.* a week all the year round.

103. *Mr. Swyer*, farm bailiff, Benenden.—Few boys here go to be 'mates' till 12 years old, unless the waggoner likes to take his own boy a little younger. It is the general thing here now for them to lodge with the waggoner, instead of in the farm house as they used to do. Such a boy would often get 10*s.* a week, whereas a boy at 16 or 17 at ordinary work on a farm will only get from 3*s.* to 7*s.* a week; and yet we can hardly get any boys to go with the horses, because they don't like the hours. The work is easier than ordinary farm work, but the boy has to be with the horses from 5 or 6 a.m. till 9 p.m. The waggoner who works with him goes to the horses at 4 a.m., and leaves at 6 p.m. Our regular men work now from 7 till 5. That's an hour less than it used to be two years ago, when they only got 2*s.* instead of 2*s.* 3*d.* a day; but they were dissatisfied with the hours because the men in Sussex had not such a long day. Another change that has taken place has been in the rate of wages. But I don't believe the poor have ever been so well off as they were 14 years ago, when wages were at 10*s.* 6*d.* a week, because flour was at 9*d.*, and meat at 4½*d.* I think it much the best plan for the cottages to be under the control of the farmer. The people are much more settled. The farmer can get the man's wife and family to help in busy times if they like, and a farmer will have sometimes to pay as much again when he is obliged to get his hops tied by others. And, in many periods of the year, a farmer will go on paying a man in winter when he does not in the least want him, in order to get his wife and family when he wants them. Only one in ten of the poor people likes the plan; they think they are not independent. Mr. Gathorne Hardy's system is that all the men pay their rent to him, but the farmer really nominates the person who is to be in them.

FRITTENDEN.

Population - 898.

104. Notes of meeting, August 14, 1868, present, the Rev. E. Moore, rector, Rev. F. C. Blyth, Mr. John Honess, farmer, and W. J. T. Hollman, schoolmaster.

Women work much less here than formerly, partly because they are so much better off than they used, for the employment of the men is now more regular. There is, however, a good deal earned by them at hop-tying and picking. Labour has become more scarce; it is especially difficult to get lads to go with horses; they don't like the long hours of work. They are expected to be there at 6·30, and to work till 8. Such boys would be 15 years old, but some boys go for a few days with horses as young as 10 years old.

Boys begin to get irregular at school at 8 or 9 years old, and between 10 and 11 they for the most part leave school altogether. The girls leave school almost as soon as the boys.

The girls, who generally go with their mothers, help in weeding, hop-tying and picking.

Boys, girls, and women are sometimes hired to pull up "kilk" (ketlocks), and a man is put to look after them; but we see no objection to this system. Before 12 years of age children are not essential to the farmer, but are very largely employed in piece work and in other ways by their parents.

A good many children are from one and a half to two and a half miles from any school; but in the case of some it is not field work but indifference which keeps them from school.

Kent.

Mr. Stanhope.

g.

BIDDENDEN.

Population - 898.

105. *Capt. W. H. Tylden Pattenson*, landowner and magistrate.—Employment for children may be divided into two sorts, the one which affects the parents only, the other the farmers. Boys in one way or another begin to work at 7 years old, and in the whole school there are not more than four or five boys of the labouring class over 10 years of age. We consider that they are wanted regularly at 9 or 10, but many do not like to send such boys with carts unless a man is with them. The hop gardens afford a great deal of work, and dogwood-scraping in the spring takes a great many from the school. Part of the parish is two miles from the school, indeed there are no less than six small hamlets. Women go less than they did; it is cheaper to employ men, and they begin to find that they can earn more at home. I don't call 'ladder-tying' a proper work for women, and here they never do it.

(C.) EAST KENT.

106. *Mr. John Robinson*, Wingham, Chairman of the Eastry Board of Guardians.—The market gardens in this neighbourhood afford work to a great many women. Their wages vary from 1*s.* in winter to 15*d.* or 18*d.* These high wages, which have increased a good deal of late, are a great disadvantage to them, because they are more apt to keep their girls at home instead of sending them to service. Still I should not like to see them compulsorily interfered with. A great many women and girls are employed in pea-pulling in July, and in potato-gathering. The former is the worst in its moral effect upon them, because they are all close together, and very young children are taken. Field work is ruination to a young girl. Farmers for the most part employ their labourers regularly here. About three cottages to 100 acres are wanted, and I am very much in favour of such cottages being under the farmer's control. It gives him a fair influence and hold upon them which enables him to keep them in order. But market gardeners with only 30 acres or so require a great deal of labour at certain seasons, when they will give anything to get it, and hardly any the rest of the year. This want is supplied by a certain surplus lot of labourers, who are chiefly maintained by the thrashing machines. Such men earn good wages, and don't care to work more than three or four days a week. The machines do a great deal of harm in disturbing regular men, who find it more profitable and more independent to go with them. Women never do so here, but a good many lads go to pitch sheaves or carry water. The youngest boys that are hired by the year would be about 14, but such boys would have led horses for some years before that. The waggoners get 15*s.* a week, a cottage rent free, and 3*l.* after harvest.

107. *Mr. Philip Harvey*, farmer, Eythorne.—Boys for rooking might be as young as 7 years of age, from that to 10. They would very likely be regularly employed at 11, because a farmer likes to employ them so for the sake of their families; but I never ask their age, I look only at their size and strength. I employ sometimes 20 in a gang with a spud to weed, and an old man goes with them to look after them; some of them are girls or women. The work for the girls would only last a week or two; they all get 6*d.* a day; it used to be 4*d.*, but they struck, and drove the old man out of the field with their spuds. Boys that go to 'rook' have a gun or pistol. You would expect accidents to happen, but I have employed hundreds of boys and never had one. Every farm in the neighbourhood is badly off for cottages. My neighbour has 500 acres, and not one cottage; so the men have a long distance to go, though less in this parish than in some of the others round. But a good many of my men live in cottages not under my control, but belonging to small owners; I never feel responsible for the domestic comfort of those men as I do for such as are in any cottages on my farm. In the village, too, there is often a difficulty about gardens, whereas on the farm nothing is easier than to cut up an acre and give a good garden to every one. But as to the condition of the cottages I have not much complaint to make.

108. *Bridges Plumptre, Esq.*, magistrate, Goodnestone.—Boys go to 'rooking' at about 9 or 10 years old, not often sooner. They would generally have a gun of some sort to frighten the rooks with. This leads to some bad accidents, and within 18 months two fatal ones have taken place near this, one at Ratling, in this parish, and another at Wingham. But whenever an old man past other work can be got he is put to it. This work lasts from November till the end of April, Sundays and all; and I have always thought it an instance of good feeling on the part of some labourers that they will go to 'rook' themselves so that their boys may get to the Sunday school. At about 12 years of age the work for boys is regular. Girls and women come to work at 7.30 a.m. and work till 6 p.m. Some few girls only, and those 14 or 15, come. They can get work the greater part of the year. In winter they take up mangold and top and tail turnips, though this last employment is not so common as it is now. Some of our labour comes from Ratling, 1½ miles off, and from other places, as we have not enough in Goodnestone.

109. *Wm. Hammond, Esq.*, St. Alban's, Wingham, landowner and magistrate.—Unless women go long distances to work, or are put to improper work, I see no objection to their labour. Whenever a woman has to stoop, such as in thinning or pulling turnips, it must be a little trying for her. The latter, which is chiefly done by able-bodied adults, is the hardest. But such work as they have at hay harvest, hop picking, and weeding early short wheat is not objectionable. A certain number of boys work regularly at 10 or 11 years old. They are not boarded and lodged in a farmer's house much before 14. But most shepherds have a boy, and then there is usually a boy about a farm for various work. A great advance in education has been made of late years by the class just above the labourer, but the tillers of the soil do not seem to me to have been much affected as yet. There is certainly a far better sense of decency and propriety, but not more intelligence.

110. The following notes are by a lady of great experience in the neighbourhood of Wingham:—

"My experience is mainly derived from visiting the outlying parts of five parishes in this neighbourhood, in each case at some distance from the main village. Schools are, therefore, a long way off, and, besides the actual distance, when urged to send the children to school, some have given as an excuse the increased expense caused by their having to send the children with their dinners, instead of their coming home to them. In the case of one school the children *used* not to be allowed to eat their dinners in school, so that the choice for them was between half a day's schooling (the distance being too great for the child to go over twice) and none.

One cause of the neglect of education certainly is early work. I know one boy that went to work here at 7 years old, and has worked regularly ever since, and has never been to school. But I don't see much difference even in the girls, the eldest being frequently kept at home to mind the children whilst the mother is out in the fields, &c., and I have known these families when the girls have been employed keeping cows along the hedges. The parents don't seem to see the difficulty of learning. "I sent her a whole year," one woman told me, "and she can't read," and so she thought schooling useless. The mothers say the children should go, if they had their way, so do the fathers, and yet between them the child is kept away for the least chance of a day's work.

They are apt to complain of the teaching in the national schools, and to prefer small schools, dissenting or otherwise. They don't like the children being taught by an older boy or girl, but say that where the children are fewer, each individual gets some attention. There is certainly some truth in this, as I can say from seeing the children turned out from both sorts of schools, for even an indifferent teacher, if grown up, is invested with a certain authority, which makes teaching more likely to be successful by enforcing attention. Children ought to be sent very much earlier than they are, and the rule in some national schools to take no children before 5 years old is, I think, a mistake. Mothers are very indifferent about teaching their children anything like household work, &c., the trouble of teaching them being greater and taking more time than doing the work themselves.

111. EXTRACTS from an ESSAY by the REV. EGERTON D. HAMMOND, (now of Sundridge, Kent,) addressed to the Sittingbourne Agricultural Association in 1856.

Domestic comforts for the farm servant have, by common acknowledgment, not received that attention which is requisite to maintain a tone of morality and self-respect among them. He returns home after a long day spent in the service of his master, generally fatigued, often wet since the morning. The same indifference to his comfort is *not* manifest in all farm establishments, nor yet is common attention to them by any means the rule. Here and there, but not generally, there is a fire accessible, where he may restore his frozen circulation, and do something, at least, towards drying his working apparel. When a little comfortable, he may take a candle and amuse himself, according to his taste. But what is the *rule* in this case? The foregoing remarks apply to the *exception*. Ordinarily, then, there is *no fire and no light* for the farm servant when the toil of the day is done. If there is a fire for his use he must light it himself, or if candles, he must either buy them or economize his stable allowance of five for two nights. Not unfrequently he will sacrifice his supper to go straight to bed, at which, having first deposited his *boots* to prevent them from freezing, he ensconces his person between a pair of sheets that defy all the colours of the rainbow for a hue that will match them. The stench of the chamber is intolerable in many cases, and no wonder, under the occupation of stable and labour stained men and clothes, the men varying in number from three or four to nine or ten in a room on very large farms, and sleeping most objectionably, in most cases, two in a bed.

The following table shows the ordinary hours of work for farm servants in East and West Kent:—

		Get up.	Bait.	Breakfast.	In Field.	Bait.	Dinner.	Second Yoke.	Bait.	Supper.	Bait and Lock-up.
		WEEK DAY. TWO YOKES, SUMMER.									
East Kent	Waggoner	3.30	4.30–5.30	5–6	6–10	10–12	12–1	1–6	6–8	—	—
	Mate	5							Waggoner leaves.	7.45	8–10
		ONE YOKE, WINTER.									
	Waggoner	3.30 or 4	4–5	5.30–6	6–2.30	—	2.30–3	—	3–4	—	—
	Mate	5	—						Waggoner leaves. 3–6	7.45	8–10
West Kent	Waggoner	4	4–5.30	—	6–2	—	2	—	—	—	8
	Mate	5									

The next table shows what are, on the majority of East Kent farms, the ordinary hours of occupation on the Sabbath:

	Get up.	Bait.	Breakfast.	Bait.	Bait.	Bait.	
Waggoner	5.30	6–8	At liberty two Sundays in three.				Two Sundays in three.
Mate	7	—	7.30–8	10–12	4–6	8–10	
Waggoner	5.30	6–8	8–10	10–12	4–6	—	One Sunday in three.
Mate	At liberty one Sunday in three.					8–10	

Thus the hours of divine service are wantonly selected for "baiting."

112. On Macknade farm near Faversham, containing 300 acres, the following is the amount of women and children's labour.—

At *haymaking* six women and three girls (under 18) were employed at 1*s.* and 8*d.* per day, respectively, for an average time of less than two days.

At *weeding* eleven women, eight girls, and seven boys were employed at 1*s.*, and from 8*d.* to 6*d.* per day for a period averaging 11 days.

At *cleaning corn* seven women and six girls were employed for an average time of five days.

At *pulling turnips* two women pulled 3½ acres at 2*s.* per acre.

At *sundry work on farm* nine women and six girls worked on an average seven days each.

At *hop-tying* 15 women and 8 girls worked at 1*s.* 2*d.* and 8*d.* a day, respectively, for an average time of 20 days. Besides this one of them tied two and a half acres by piece work at 13*s.* an acre.

Kent.
Mr. Stanhope.
g.

At *shaving hop poles* two women and two girls shaved 11,400 at 1*s.* per 100.

At *cherry gathering* eight women were employed at 1*s.* 4*d.* for an average time of 13 days.

At *bird-minding*, one boy worked 111 week days and 22 Sundays at 8*d.* a day; one 55¾ and eight Sundays at 6*d.*; one 30½ and six Sundays at 8*d.*

At *hay-making* four boys worked about five days each at 6*d.* and 8*d.*

Two boys shaved 2,626 poles at 1*s.* per 100.

With *horses* five boys worked for periods varying from eight to 72 days.

180 women and girls (with 180 children under 12) earned at hop-picking an average of 2*s.* 6*d.* a day for the women.

Summary.—Total paid in one year for such labour 514*l.* 12 women, eight girls, and eight boys were employed. Highest sum earned by a woman 5*l.* 10*s.* 9*d.*, average sum about 3*l.* Average sum by girls 2*l.* 7*s.* Average sum by boys 3*l.* Hop-picking and harvest not included. A boy of 10 earned only 1*s.* Three of 11 earned on average 2*l.* 15*s.* One of 12 earned 3*s.* 6*d.* One of 14 earned 10*l.* 16*s.* 5*d.*

This return includes no harvest work.

113. *Mr. F. Neame*, the occupier of the farm, in sending me the table from which the above was extracted, says, "I know there are persons who have "an impression that what a woman earns by outdoor "employment is lost by neglect of home duties; "but the neglect of home duties would be the same, "whether the employment away from home is out of "doors or in doors; and, I venture to say, that it "will be found where the woman seeks employment "when she is able to undertake it, the family is better "brought up, better provided for, and more cleanli-"ness found in the home than where the mother of "a family is unwilling to employ herself industriously "at home or to seek for work. Idleness leads to "the increase of slothful habits, work leads to the "increase of industrious habits. If a prohibition of "the employment of children under a certain age is "enacted there will be a greater necessity for the "woman to seek employment to help towards the "maintenance of her family. As regards the em-"ployment of children in agricultural work under a "certain age, I do not see the necessity of any Act "to prohibit it, for in agriculture the children will "not be of much use under 10 years of age, neither will "they be of so much use if they are kept without "work much over that age, for it is by early and good "training that the habits of industry are formed. "Between 10 and 13 or 14 is a time of life when the "children are unable to obtain a situation away from "home, a time when they are a heavy and increas-"ing expense to their parents, and a time when they "require better living than perhaps the wages of "their parents can afford, without the assistance of "some earnings from their children. If there should "be any interference on the part of the Legislature in "regard to the employment of children in this and "other counties offering similar employment, it "would be attended with great inconvenience both to "employer and labourer. Agricultural work must "be done at regular times, only varying according "to the seasons; there is always a time to do it, and "if the proper opportunity is missed it either costs "double to do, or perhaps cannot be done at all; and "by its neglect, a loss falls on the producer and con-"sumer, but more especially on the former. If hops "are not tied in due time the extra cost is very great, "if weeds are not cut they run to seed, if fruit is not "gathered in proper time it perishes, if corn is not "cut in proper time it runs out, if hops are not "picked in proper time they are blown away."

ASH.

Population - 1,582.

114. *Rev. H. S. Macharness*, vicar.—The employment of the children here in the fields does not do nearly as much harm as the employment of the women, which takes them from domestic duties and causes the girls to be kept from school. The few shillings a week they earn are very attractive, but it costs them a great deal more to get it. One-third of this parish being market garden land women and girls are very much wanted, and in some cases it is made a condition of letting cottages that the family shall go out to work.

WOODNESBOROUGH.

Population - 889.

115. *Capt. W. Gillow*, landowner and occupies 500 acres.—There is great employment here for women and children, because of the market gardens. I don't think it a good plan for women to go to anything except the very light work, such as hop-tying and picking. I never saw a family where the wife goes out much to work which appears better off by reason of it. Young girls go to the gardens, but we never employ them unless they come with their mothers. Boys will go "rook-keeping" at 6 or 7 years old sometimes. Some boys on my farm have never been to school because their fathers have got regular work for them with odd horses, &c. The rook-keeping lasts throughout the winter months. I want no "mates" on my farm, because I don't believe in the system of baiting horses. I only employ eight horses because I have steam power, and yet I find it worth while to employ a horse-keeper. His duty is to feed the horses and cut up their feed, and the waggoners and "mates" have nothing to do with it. I don't think the horses want baiting on the usual system, and I don't like the boys to be kept up till 10 o'clock. My horses are all the better under the new plan, and its other advantages are that I get rid of "mates," who are constantly running away from their engagements, and that there is no longer any temptation to the waggoners to steal corn for their horses. No boy, therefore, works on my farm after 6 o'clock. I do not approve of a labourer who lives on the farm keeping a pig. Formerly they all did it, but we consider it holds out too great a temptation to them to steal.

ASH.

Population - 2,039.

116. *Mr. Thos. Coleman, Mr. John Maylam*, farmers.—No boys, as a rule, work before 10 years of age for us. They begin with "rooking." In some cases they are entrusted with guns. This work would last from November to May. In the summer they would go weeding till harvest time. Perhaps a dozen boys to under a man would do the weeding. They would be 6*d.* boys. Sometimes women go in this way, but girls very rarely. In this parish there are many market gardens, in which the regular work is done by women and grown up girls, working by the day. The existence of these gardens implies sufficiency of labour at hand, but it makes employment rather irregular. The disinclination of lads to be hired by the year is very much increasing, as they prefer the independence of daily hiring.

117. *F. T. Curteis, Esq.*, large occupier, Elmstone Court.—Labour for boys I call precarious till they are 12 years of age; but before that age they can get a great deal of employment. At rook-keeping a boy can begin at 7 years old. This work would last all through the winter and early spring, and besides that they have a little pig-keeping, and help at harvest. On the whole they could get certain work nearly seven months in the year. Girls go in the spring dropping potatoes, and in October they pick them up. The common plan is for a farmer to sell them on the ground, and the buyer hires women and children to follow the machine which ploughs them out of the ground. It is a very bad school for girls. Besides this they get gleaning and hop-picking. In all they would get steady work about three months in the year. For my part I do not see why young children should not go to school nine months in the

year, so far as employers are concerned. In addition to the work mentioned, women will also spud thistles, cut beans, and sometimes peas, and in winter they go with their families to cut up turnips for the sheep. This is nasty, wet, and disagreeable work. A good man earns 15*s.* a week here; but the piece work, which is considerable, adds 2*s.* a week all the year to his wages. On my farm, which is large for this district, men are never unemployed; but many of the farmers, who hold only 30 or 40 acres, cannot employ men regularly. Still I see very few men out of work.

BRABOURNE.

Population - 743.

118. Notes of meeting, August 26, 1868.

PRESENT:

Rev. JAMES BROTHERS, vicar.
Capt. J. KIRKPATRICK.
Mr. O. ANDREWS, Mr. F. PELLATT } farmers.
Mr. F. WORRELL, cert. schoolmaster.

Boys go to rook-keeping at 7 or 8 years of age. They would be 12 before they are regularly employed, but they would go also to other occupations from four to five months in the year. Mr. Worrell says that from 8 years old for the next two years he can with great difficulty keep them enough at school to satisfy the Government requirements, but after 10 he seldom gets them at all at school. As a rule the girls stay at school rather later than the boys. If they were to attend 250 half days through the year up to 11 years of age, they could pass children up to Standard V., whether they made attendance irregularly or not.

If boys were kept away from agriculture up to 12 years of age, and required to go to school six months in the year, it would not interfere with the requirements of farm labour, if the particular months in which they are to attend are left free.

It is agreed that some parents in this parish do not send their children to school, and that some pressure is required in their case before they will do so.

Distance from school is no obstacle to attendance in Brabourne. From Monk's Horton, where there is no school, the children have to go two miles in some cases to school. Women are very unwilling to do work here, even if it be easy. A few girls go with their mothers to do light work.

SELLINGE.

Population - 560.

119. Notes of meeting, August 26, 1868.

Rev. JAMES BELLAMY, vicar.
Mr. FRED. ANDREWS, farmer and late guardian.

Women go spudding thistles, harvesting, tying and picking hops, and getting up turnips, which altogether would last probably three or four months in the year. A few used to go with thrashing machines, but have now given it up.

Mr. Andrews never employs a boy for bird-keeping. Some however do so in the parish. He thinks young boys are not much employed here, except at "grate" work with their families, until they get big enough to be about a farm. Boys are fit to lead a horse at 12 years of age.

Nearly half the parish is under grass.

There is a night school for girls as well as boys; the former are only taken if some one will take charge of them and bring them.

The school is mixed, with a mistress; boys over 10 are not expected to attend. Mr. Andrews considers education low among farm lads, many of whom can hardly read. He thinks the standard higher here, however, than in surrounding parishes. The vicar says that, judging by his confirmation classes, the state of education is fair.

SMEETH.

Population - 486.

120. Extracts from returns sent in by the Rev. C. H. Robertson, vicar of Smeeth.

The employment of women in the fields is most detrimental in every way to themselves and their families; women continually employed in the fields become entirely demoralized, and attend less and less to any home duties; the husband has no comfort in his home, and resorts to the public-house. None should be employed in winter at all, and proper care should be taken as to their promiscuous mixing with men in the same work; but it is difficult to say what Government can enforce. For harvest and hopping, female work seems necessary, but seldom at other times. A farmer takes a woman to save wages when he might have a man.

I consider that boys are stunted in growth by over work; they should not be employed under 12, unless at the very lightest work. The hours of work should be restricted to a certain number, according to whether the work is light or heavy; the quality of the work to be settled by a committee of independent farmers.

I am convinced that the present poor law would operate more beneficially, and in the end economically, if there was established in central points in every county a labour agency office, to give work of some useful kind under Government. No able-bodied pauper should get relief, but instead a *ticket for employment.* The wages to be a trifle below that of private employers, and private employers to be at liberty to get when needed any number of hands from the Government office. The present poor law is being daily more abused by numbers of idle persons who will not work so long as they can get kept by the poor law. The work proposed should be of public utility, and act as a saving in county and highway rates.

STOUTING.

Population - 213.

121. *Mr. J. B. Andrews,* farmer.—Women are reluctant to work here, because they are so well off. They won't go to stone-picking; they never take up turnips or thin them. Any one family will take turnips by the acre to 'top and tail.' We have about enough labour in the parish, except at special seasons.

The "mates" are mostly boarded with the waggoners.

122. *J. Bacon, Esq.,* agent to Sir E. Dering, Bart., Pluckley.—Women are employed in thistle spudding three or four weeks in the year at 1*s.* a day, and at other times get a good deal of work in the hop gardens. This is all piece-work. Girls are never employed though they often go with their mothers to work. Boys under 12 are very little use to a farmer, and under that age their fathers can't get them regular work. I should like to see all children under that age get a half year's schooling, and I don't see what there is to prevent their going all the winter. There would be a little "crowkeeping" up to Christmas, but I think an old man would do the work better. We often put the boys to it by way of giving them something to do. A great many cottages in East Kent are quite uninhabitable. Sir Edward Dering's are all in good order. He charges only 1*s.* 6*d.* for a cottage with a good garden, which is much lower than the rent of most of them. We generally give 30 rods of garden which is quite sufficient. Some of the cottages in worst order are those built upon the farms, and I think that very likely this is due to their having been under the control of the farmer. When they are so let the tenants ought to repair, and ought to be bound to do it properly. But I think it better for the landlord to keep them in hand, and the majority of cottages are so let about here, though practically the nomination is in the hands of the tenant farmer.

Kent.

Mr. Stanhope.

g.

The following relates to Romney Marsh.

123. *Mr. W. D. Walker*, large occupier at Honeychild, New Romney.—The marsh being to a very great extent under grass very little labour is required in some parts. One man can do the work on two or three hundred acres of land; and at "shearing" time, when men are wanted, they go about in "sets" to the different farms to do the work. The result of this is that between Lydd and Rye there is not a cottage within a mile of another cottage, and the difficulties of schooling for such children must be very great. Here we are deficient in cottages, for we require much more labour, and many of my men come two miles from New Romney. At harvest we are very dependent on "foreigners," who sleep in the "lodges" and places, earn good wages, and drink it all up on Saturday nights. I have lately built four cottages here with two bedrooms and a large attic. They take lodgers. Even half a dozen can sleep in the attic. Our regular men earn 15*s.* a week, and have piece-work enough to add probably 2*s.* a week to their wages. Ploughing is piece-work, so is sheepshearing. Women and girls go to single turnips, and sometimes, though rarely, women go to threshing machines to hand the sheaves on to the machine; but as a rule I should say that they are not very willing to work. Boys will go at 10 years old or younger to keep rooks. I don't trust the young ones with a gun. Very often such boys work all the year, but that is generally because their fathers are our constant labourers, and as a rule we don't want them regularly before 12, at which age boys are fit to go with horses.

124. *Mr. Ricks*, national schoolmaster, New Romney.—"Lambing" and "wool gathering" begins in April and lasts through the summer. But the latter affects us very little now, because few families go at all, or if they do, go only in the evening. The children of "lookers" (shepherds), are those who are most taken away. These are a higher class than the ordinary agricultural labourers, and keep a horse and cow, and they can have their children later at school. But the great difficulty of school attendance in the marsh is distance from school. Some come three miles and over, and that can be done in summer, but it would be dangerous to send children alone in the winter because of the deep ditches only crossed by a slippery plank. At some times, therefore, we have only infants at the school, if we exclude the children of tradesmen. We have one boy of 13 who lives so far off that he could not have been expected to come to school at all before he was 8 or 9 years old. Some of them might be reached by dames' schools where there are a few cottages together; some could not. Midley, for instance, is almost all pasture, has only seven cottages, not all with families, and these would be three miles from school. The school at Brenzet was for five or six parishes round, all very small. The girls get off very young into small places. The oldest girl here is 11 years of age. We have several boys older.

[The difficulty of distance was also mentioned as a very great one by the vicar of New Romney. Of his class for confirmation, however, he said "there were 65 "of them who were very boorish when they first came, "but afterwards I found only two or three who "couldn't read. I did not test their writing." On the other hand, the Rev. C. Cobb, of Dymchurch, says of his night school, "We frequently have young men "there who don't know their letters."]

The two following relate to the Isle of Thanet.

St. Nicholas at Wade.

Population - 670.

125. *The Rev. H. Bennett*, vicar. — Spudding thistles, picking stones, cutting mangold, and crow keeping occupy many young boys. The first two descriptions of work are done by girls also. They often do them in a lot under the direction of an old man. The irregularity caused by this has been in fact the cause that the education of the children is at a low ebb in this parish; but also the children are taken away earlier than formerly, and we rarely keep a boy after 9 years of age. We have a mistress' school with 74 on the books; if all came who ought, I should have 100. There is also a small dame's school at Sarr. As a class, the girls are much better educated than the boys. Women will cut beans at harvest, pick stones, or cut mangolds, but they are not much employed. They are unwilling to go because their husbands are well off. In some cases they are only got to go by gleaning being forbidden unless they do so. The less women are employed the better for their husbands.

St. Laurence.

126. *John Kennet, Esq.*, farmer.—Wages for ordinary labourers are 15*s.*, and they probably earn at piecework in cutting sanfoin and corn as much as 7*l.* or 8*l.* The hours of work are usually from 6 to 5. There are very few cottages in the district between this and Minster, and very often men walk two miles or more to work. Farms requiring three or four cottages have only one. More are wanted than formerly, because we have adopted the plan of having married waggoners on our farms. The cottages are usually let with the farms, and here it is to my mind especially necessary, because of the many openings to other sorts of work which the men have. Young boys are employed only occasionally. They could rarely be employed before 12 or 13, and few boys are competent to lead horses before that age. It is essential that boys should begin early to work, and as it is, all the sharpest boys are being taken for other employments, so we have to be content with the residue. Potatoes are largely grown here, and children are employed at setting and picking up. Sometimes they are ploughed up, and a lot of children with a man collect them. Sometimes a man hoes them up and takes the children to help. It is not uncommon for a farm of 200 or 300 acres to have 40 acres of potatoes.

---

127. Summary of Returns not extracted in previous evidence.

All but two deprecate any interference with the labour of *women*. In that case the return comes from a parish where hardly any are employed. "Young persons are often the worse for it, as well in "morals as also in forgetfulness of their schooling; "and it renders them unfit and unwilling for "domestic service, not to say duties; yet the work "on the farms could otherwise hardly be carried out," (hop-growing parish. — E. S.) "and the women's "earnings are needed by the family."—(Rev. C. Lane, rural dean.)

One advocates prohibition of female labour on Saturdays after 12, to prevent Sunday work, and also of winter work, which "they would be better off "without."

As to *boys*, two advocate the alternate day system up to 12 or 13; but with a doubt as to its being practicable. In three other cases it is suggested that labour should be prohibited before 9 or 10 respectively. One employer, and guardian of his parish, writes:—"I never knew one hurt from worke; on the other "Hand many grow into Lazy bad habbits through "the parent allowing them to prowel the streets" (sic).

One clergyman says, "I think the boys engaged "with horses do suffer, for they are engaged from "5 a.m. to 10 p.m., partly in the stables. It is known "as the 'Joskin' system. After being once engaged "the boys seem to become dull, slouching, sensual "louts. I think the system bad for employers and "employed. Boys with horses ought not to work "more than 12 hours."

In only three cases is a return made of boys neither at school nor work. These contain 4,012 inhabitants. 10 boys and 12 girls from 8 to 10; 12 boys and 8 girls from 10 to 13 are included in this class.

In one parish 40 per cent. of the young population are said to be without sufficient education. In another, "Most of them could not pass the third standard,

" many not the second." In another, " Probably " 1 in 20 cannot read or write, and 1 in 12 cannot " write."

One employer says, " I have not a well-educated " labourer, male or female. They may some of them " be able to read after a fashion, but I should say " that there is not one that can write well enough for " a stranger unused to them to read off at first " sight."

128. Further Evidence as to the effect of field work on school attendance.

Knockholt.—The attendance during seven months in the year is very fluctuating. There is no real effort made to send children. If they can earn a few pence during the week they are kept at home. They are kept at home here for strawberry and gooseberry picking, hop-tying, haymaking (earning 6*d.* or 7*d.* a day), gleaning, hop-picking (from 1*s.* a day upwards), blackberry picking (this year they could easily pick half a sieve a day, which is worth 1*s.*), acorn collecting (this year they could easily pick up one bushel a day).

Shoreham.—" To judge of the effects of educa- " tion I have reviewed the lists of children educated " here, and I find the majority of them filling situa- " tions of respectability, and many of them of trust " and confidence. Four are clerks, five foremen in " warehouses, three nursery governesses, four in " business, three foremen in carpenters' shops. But " the children of farm labourers stay at school a less " time than formerly, owing to their receiving a " better education at an earlier age. The influence " of the railway, too, has caused the population to " become more migratory, and the attendance is less " good.

" No child has been withdrawn from school for " permanent farm labour who could not read " previously."—[*Mr. A. White*].

Linton.—Leave at 9 at earliest, because teaching and clothing paid for.

Boughton Monchelsea.—Nine or 10, except sometimes in winter afterwards.

Marden.—Many boys stay away from March to the end of hop-picking ; 36 have been absent for work the whole or the greater part of the last five months.

2	were	13	years old.
4	„	12	„
6	„	11	„
8	„	10	„
6	„	9	„
6	„	8	„
3	„	7	„
1	was	6	„ [*Mr. W. Bowers.*]

Staplehurst.—[At the endowed church school only four boys of 32 of the poor class present (July 31).

Henry Packman, age 8½, the son of Mr. Reeve's bailiff, had just come to school, having never been before, and not knowing the alphabet. He said he had four brothers, of whom none had been to school. —E.S.]

Wateringbury.—Boys remain pretty well till 11.

Hawkhurst.—Boys leave at 12, and in some instances get little schooling after 10. Girls at 13. Eight boys and four girls over 10, and six boys and seven girls under 10 come two miles to school. Some few cottages are two and a half miles from any school. In summer almost all the boys 10 years of age work ; some are taken away younger to tend birds, but only for a time.

Sandhurst.—" At a confirmation last year I found " some who were good scholars once had almost lost " what they had learnt ; some still read well me- " chanically, but had forgotten the meaning. The " boys are worse than the girls."—[*Rev. J. Ridout.*]

Benenden.—" The children of labourers leave as " soon as they can earn anything."

Cranbrook.—" Some parts of the parish are three " miles off, and two school churches are wanted " " [and see ante].

Biddenden.—" Boys wanted regularly at 9 or 10. " They begin work at 7. There are not more than " four or five boys of the labouring class in the school " over 10 years of age."

Frittenden.—" Boys irregular from 8 or 9, and " between 10 and 11 they leave altogether."

Minster (Sheppey).—Boys begin field work at 7 or 8, and generally do not return till after harvest and gleaning. Girls do not work before 14 or 15, but boys leave altogether in some cases at 9, and very few are at school after 10.—[*Mr. Batchelor.*]

Wye.—Boys leave at 10, girls at 11.

Woodnesborough.—" Very few boys kept over 9 ; " boys of labourers go to work altogether at that age. " Girls leave at 10 ; they are fearfully deteriorated " by field work, to which I have known them go " at 8."

Staple.—Boys leave, on the average, at 10.

Stouting.—Boys leave about 11 ; girls at 13. Those who come furthest are the most regular.

Brabourne.—" After 10 we seldom get boys to " school at all. The girls stay rather later."—[*Mr. Worrell.*]

Great Mongeham.—Boys begin work at 9, but we can keep them on and off at school till about 11.

St. Nicholas-at-Wade.—" We rarely keep a boy " after 9 years of age."

129. Night schools exist in 13 parishes out of 43 to which my inquiry on this head extended. In seven cases they were reported as given up after trial, in four of them owing to the scattered nature of the population. Four reported want of masters as the cause. The Rev. T. B. Dickson, of East Church, says, " The only evening scholars materially benefited " are those who have been pretty well taught " previously at school. Heavy, overworked, or weary " young men, who scarcely know their alphabet, are " taught with great difficulty, because it is requisite " that the teacher or teachers should take them " singly." And one schoolmaster enumerates the following difficulties in the way of maintaining a night school :—

1. The want of good teaching power, the master being too exhausted.
2. The want of working interest on the part of the employers of labour.
3. The inaptitude of boys to learn, owing to exhaustion.
4. The want of home discipline in enforcing regular attendance.
5. The contraction of bad habits arising from such concourse of boys before and after school hours.
6. The absence of intellectual attractions.

" All these difficulties," says another return, can be " got over, except the want of teachers."

130. Evidence as to the situation and condition of cottages, gardens, &c. in 31 parishes in Kent.

LINTON.

Population - 613.

Rev. T. G. Carter.—All those built that I can remember have three bedrooms ; some of the older ones have two. All have gardens and allotments. [A very neat village.—E.S.]

BOUGHTON MONTCHELSEA.

Population - 1,190.

Rev. S. Shepherd.—In number insufficient ; as to accommodation they mostly have two bedrooms, and

Kent.
Mr. Stanhope.
g.

a few have three. Abundant gardens, and one field of allotments. Rents 2*s.* to 3*s.* a week. Some of the men have to work a mile and a half from their homes.

MARDEN.

Population - 2,295.

Rev. J. Deedes, and *Mr. Stephen Walker*, guardian. —Sufficient for the labour required. The average distance to work would be about a mile. They are improving, and have now mostly two bedrooms. Gardens are fair, but there are no allotments.

STAPLEHURST.

Population - 1,695.

Rev. M. T. Pearman. — A few wooden huts remain, most of which have a very large bedroom and a little one, but many new brick cottages have been built.

Gardens general ; allotments only to the tenants of the principal landowner.

HUNTON.

Population - 935.

Rev. J. R. Hall.—Good; mostly belonging to Mr. Bannerman, who has much improved them. The only bad ones belong to a lady who is non-resident. As a rule every family has a house with four rooms. All have gardens. Rents from 2*s.* 6*d.* to 3*s.* 6*d.* per week.

YALDING.

Population - 2,076.

Rev. E. Baines.—Not sufficient, for part of the labour comes from adjoining parishes ; they are mostly let with farms. With some exceptions they are miserable; some are on one floor only, and that of earth ; many have one bedroom only ; some are flooded whenever the water is out. The curse of the place are the little builders, who run up a row of houses with floors below the level of the ground, so that they are always damp.

Very few have gardens, but there are a few allotments, although the ground is too valuable to give away for these purposes.

The rents are enormous. A single room lets for 1*s.* 6*d.* per week, two for 2*s.* 9*d.*, and a good cottage with four rooms for 4*s.* 6*d.* All that can, therefore, take in lodgers.

NETTLESTEAD.

Population - 575.

Rev. W. F. Cobb.—In many the bedrooms are very deficient in light, ventilation, drainage, and water supply. Rooms generally a good size. Gardens fair. They mostly belong to the landowners, and are let with the farms.

Rents of old cottages, 2*s.* to 2*s.* 6*d.* a week ; of 14 new ones, from 3*s.* 6*d.* to 4*s.* 3*d.* ; and of the five last built, 2*s.* 6*d.*

LOOSE.

Population - 1,573.

Rev. S. Simpson. — Mostly fair. Some of the speculators' houses are very bad. Few gardens, and no allotments.

WATERINGBURY.

Population - 1,370.

[Meeting, August 1868.]—Insufficient, which leads to overcrowding. There are some belonging to a speculative builder, with one bedroom. As a rule the cottages are fair. We are very badly off for gardens, and such as there are, are small or a long way off, so that they are badly cultivated. The best size is thought to be one-eighth of an acre. Rents for three bedroomed cottages, 3*s.* 6*d.* Some of those on the farms are let at 2*s.*

BOXLEY.

Population - 1,470.

Mr. Smith.—Good, and with gardens, allotments being given up.

BEARSTEAD.

Population - 638.

Rents from 1*s.* 6*d.* to 3*s.* a week, or even more.

EAST MALLING.

Population - 1,974.

Rev. W. L. Wigan.—The rooms for the most part ought to be higher and larger ; frequently there are only two bedrooms. Lodgers are less taken in than formerly. Small tradesmen hold most of the cottages. Gardens nearly sufficient.

RIDLEY.

Population - 101.

Rev. T. P. Phelps.—Belong to landowners; have two bedrooms. Two others are very bad, and have only one bedroom, with a sort of landing at the head of the stairs. Water supply and drainage bad. Rent 2*s.* a week.

WROTHAM.

Population - 3,335.

Rev. C. Lane.—The poorest have chalk walls, but generally they are of brick, and tiled. Most have two bedrooms. Rents 2*s.* 3*d.* to 2*s.* 6*d.* a week.

HAWKHURST.

Population - 2,715.

Meeting, August 11th, 1868.—Few have three bedrooms ; two is the rule. Some are crowded, and a good many lodgers are taken in. A few of the mud cottages still remain.

Two bed-roomed cottages let at 1*s.* 6*d.* to 2*s.* 6*d.* on the farms, and at a higher rent in the village.

SANDHURST.

Population - 1,231.

Rev. G. Ridout.—Very small, but above the average. 20 have lately been built with three rooms. A few men have still a mile or two to go to work. Gardens general.

Women describe themselves as being driven out to work by being in the cottages of their husbands' employer.

BENENDEN.

Population - 1,662.

Rev. W. J. Edge.—On the Hempstead estate are rapidly becoming models. As to the others, much supervision seems necessary. Being let with the farms, repairs and sanitary requirements are too often indefinitely postponed. Few have no gardens.

BIDDENDEN.

Population - 1,412.

Capt. Pattenson.—Cottages fair, none probably with one bedroom. Gardens decent.

FRITTENDEN.

Population - 898.

Meeting, August 1868.—Many good, and some very bad and overcrowded. On Lord Holmesdale's estate there are not half the required number, and some men have a long way to walk. Almost all have gardens averaging 20 rods, and some have allotments.

EAST CHURCH (SHEPPEY).

Population - 996.

Rev. T. B. Dickson.—Sufficient ; three to 100 acres. A number of good cottages have been built during the

last 20 years, so that large families are well accommodated. All contain two bedrooms at least, more three. They belong to the landowner, and are of brick, slated. The outbuildings are too good. Cesspools are too near; but no sanitary measures can be carried out in country places, where the guardians of the poor are themselves tenants of great landowners. They dare not, and do not. The poor are fond of building up the bedroom chimneys. It seems to me that medical men do not sufficiently insist on ventilation. Rents are 2*s.* 6*d.* Gardens general, but from the custom of changing masters frequently neither houses nor gardens are what they might be.

SELLINGE.

Population - 560.

Meeting, August 26, 1868.—Not enough to the farms, and many labourers have a long way to walk; some as far as one and a half miles or more. They always go back to dinner, if possible. Some have no wash-houses, many but one bedroom. There is a general want of bedroom accommodation. Rents 2*s.*, with or without gardens.

STOUTING.

Population - 213.

Mr. J. B. Andrews.—Some of the cottages are very small and bad, and the bedrooms reached only by a ladder. On one property here there is a great deficiency; a farm-house has been let out to labourers' families, but makes a wretched substitute. All have gardens.

BRABOURNE.

Population - 743.

Meeting, August 26, 1868.—Deficient; only a few on the farms. Bedrooms insufficient, the majority of cottages having two. Some should be attached to each farm. Capt. Kirkpatrick's are let at 1*s.* 6*d.*, but the average rent is 2*s.* a week, including generally a garden.

ELMSTEAD.

Population - 492.

Rev. G. Prideaux.—Three cottages have only one bedroom; the mass of them have two. Gardens are general.

WYE.

Population - 1,596.

Rev. T. E. Cato.—Most are in the village, and not on the farms. They are very bad; some have one bedroom, hardly one has three.

NEW ROMNEY.

Population - 1,062.

Rev. R. Smith.—Have mostly two bedrooms; many no garden. In "Hope" there is a great want, and men have a long way to go. No new ones are being built. Rents 2*s.* 6*d.* to 3*s.* a week.

DYMCHURCH.

Population - 618.

Rev. C. Cobb.—Have two bedrooms. Gardens are much wanted, but there are a few allotments.

SALTWOOD.

Population - 643.

Major G. Deedes.—On three out of nine farms too few, but there is no actual want in the parish. Ventilation, drainage, and water supply good. Rent from 1*s.* 6*d.* to 2*s.* 6*d.* Gardens and (in many cases) allotments.

WHITFIELD.

Population - 220.

Mr. J. M. Fielding.—The old ones are all bad, with too few rooms. Water supply and cesspools bad. Certainly not all have gardens. The number is insufficient. Ownership various. Rent 2*s.* to 3*s.*

GREAT MONGEHAM.

Population - 340.

Rev. E. Penny.—Scarcely any with three bedrooms, or with one only. They mostly belong to speculators, who charge as much as 6*l.* for them at least. In good repair. Gardens very small, and no allotments.

WORTH.

Population - 430.

J. Henderson, Esq.—Belong to small owners, and average 2*s.* a week rent, generally including a garden. Most have two bedrooms. In number insufficient.

ST. NICHOLAS-AT-WADE.

Population - 590.

Rev. H. Bennett.—Bad, particularly in sleeping room; scarcely one has three bedrooms; some have one. No improvement has taken place for many years. They belong to several owners; there is not one privy to each cottage. Gardens of a fair size general. Rents about 2*s.*

THE HOP-PICKERS IN KENT.

131. [The following paper by the Rev. J. Y. Stratton, Ditton Rectory, Maidstone, is mainly extracted from an article written by him in the Leisure Hour.]

"By increasing the accommodation for drying and storing the hops, and obtaining a larger supply of labourers, the hop-picking season has of late years been shortened nearly one-half. It rarely exceeds three weeks, and is usually a less term, commencing about the close of the first week in September.

"To pick 50 acres of hops there are upwards of 200 people, who are divided into parties or 'companies' of eight or ten adults, besides children. The chief man of the company is the 'binman,' whose duty it is to keep the bins supplied. Each picker has a bin or half a bin, into which the hops fall as fast as they are picked off the bine. The bine is cut near the root, the pole pulled up and laid conveniently for the picker. In some districts baskets are used instead of bins. The workpeople are paid by the bushel, the agreement being to pick a certain number of bushels for a shilling. This is called 'tallying,' from the ancient and still customary use of the tally. Its recommendation is that it furnishes a simple method of keeping accounts correctly among people who can neither read nor write; but it is giving way before the educated system of booking the work, for which purpose the services of a clerk are required on the ground. The measurer, or tallyman, is the person whose duty it is to measure each picker's work, and thus regulate the pay. By this means also the quantity of hops is known before removal from the ground; and a check is thus provided, securing in some degree the property when taken from the kiln.

"The different bins' companies take up their ground in a line at first concealed by the hops, and from 200 to 300 yards in length. As the poles 'come 'down' the bins are removed from time to time, so that the people keep close to their work. Under favourable circumstances three to four acres a day will be cleared of all trace of vegetation as effectually as if swarms of locusts had been busy there. The contrast between the luxuriant growth in front of the workpeople and the devastation they leave behind them is striking. The work is usually carried on cheerfully, if not quietly; but there are frequent exceptions. The motley crowd of London Irish and towns' poor, clad in tattered habiliments, will unite and force the home pickers (usually nothing loath, excepting to save appearances) to strike for an increase of pay. The tally has been fixed at seven, and the

Kent.
Mr. Stanhope.
g.

cry is for six ; in plain language, they demand twopence a bushel instead of picking seven for one shilling. If agreement on the ground is not possible, they will rush *en masse* to the house of the hop-grower, and demand justice with loud cries and violent gesticulations. At such moments there is not, perhaps, the greatest possible security for person or property, and cases have occurred where the assistance of the military has been required. Generally the dispute is terminated by paying off and discharging the most turbulent and making a partial concession. In the history and practice of strikes a mob of hop-pickers furnishes singular and curious examples.

" In the early part of the month of September numbers of the poorest inhabitants of London, the borough, and great towns, principally situate on the Medway and Thames, leave their homes for the purpose of obtaining employment in the hop gardens of West Kent. Railway facilities are provided for them at reduced fares by the South-eastern Company. They are brought to Maidstone and stations between that town and Tunbridge. In addition to those who come by rail are numbers who arrive on foot ; but of these no accurate estimate can be offered. It is also customary to send to certain convenient places of meeting, waggons, which convey many to their respective lodgings or 'hopper-houses.'

" The hopper-house is generally a long, low-pitched building, divided internally into ten or a dozen compartments, each with entrance from outside. The size of the compartments—we cannot employ the term apartments—is 10, 12, or 14 feet square. They are open to the roof, nine feet high, side-walls about six. Internal division is brick, with strong lattice-work above. The building is brick, and slated or tiled. Older buildings for this purpose are often formed of shingle, or wattle and plaster, with thatched or boarded roofs. As the tenements are required principally for sleeping in, no window is needed, and fire-places are built apart for cooking purposes.

" Each compartment is allotted to a bin's company, leaving the arrangements to be settled by the party. Where there is a family, one place is sometimes assigned to them, and care is in some cases taken to have a separate lodging for young unmarried men. The bedding is straw, with which the floor is thickly littered, and upon this are laid such articles for comfort as the immigrants bring with them ; blankets, or counterpanes, or rugs of some kind. Sheets are a luxury rarely, if ever, seen. A screen made of straw twisted in a sheep-hurdle, or a similar contrivance, may be seen in some of the houses ; but there is little attempt to secure privacy, and, indeed, little use in attempting it. But the occupants do not generally trouble themselves on the subject. The use of tables and chairs is wholly foregone during their sojourn in the country. Lanterns are provided by some hop-growers, but it is customary to extemporize a candlestick and fix it on the wall, or hang it from the roof, or set it on the straw. A few pegs driven into the wall, and a stick or two fixed cornerwise at the eaves, to hang clothes on at night, complete the furniture of the hopper-house ; while a tin pan or two for cooking, and a bowl or two and tub for washing clothes, are joint property of the occupants. The latter must be placed on the ground, so that to wash one's face requires the performer to kneel.

" Of late years tents have been extensively used, and, if a trench is dug outside, and care be taken against overcrowding, and to secure a free draught through them in the daytime, they supply excellent accommodation. The want of security is the only objection against them which we have heard alleged ; and, although one may smile at the notion of lock and key for those

> 'Quorum cophinus fœnumque
> Omne supellex.'

the loss of their furniture would be a disaster to these poor people. It is customary to provide padlocks for the hopper-houses, which are secured during the time the people are at work.

" The accommodation of the hopper-house is about the same in point of comfort as that provided for vagrants in the stable of a union workhouse. But it frequently happens that they are overcrowded ; ten or twelve men, women, and children sleeping together in one place, so close that there is barely room to step between them. In such cases the heat is most offensive, and the atmosphere dangerous to health. Cleanliness, like some other virtues among the wandering poor, is but little cultivated, though one may see them washing their faces on a Sunday morning. But, where boys and girls grow up without shoes and stockings, cleanliness comes to be generally ignored. It would be a work of the most useful kind, tending directly to improve these classes in habits essential to health, if means were taken to bring them to wear some protection against the dirt of the streets, which becomes ingrained into them, and which, from habit, they regard with indifference.

" It is customary to supply fuel to each bin's company. A couple of fagots a week suffice. In addition to the cook-house fires are built on the green, around which the people sit, if the evening is fine, and sing their songs and crack their jokes ; after which they turn in for the night and settle down to sleep. Any one passing near the spot an hour later would not suppose that, in the long and low-roofed tenement hard by, more than 100 souls were gathered together ; but such is a fair specimen of the accommodation. Except as regards overcrowding, we express the belief founded on all the circumstances of the case, that little more can be done, though a few suggestions will be offered in their place of a practical kind for certain improvements.

" One or two instances will, however, first be given of other tenements which the exigency of the service creates.

" Sheep-hurdles are first fixed into the ground and fastened together. Others are placed on the top of them slantwise. Opposite to them is a similar construction. By fastening the hurdles which meet at the roof angle we have the skeleton of sides and roof. This is thatched with wheat-straw, secured by hazel sticks. Such a building may be made of any length, and is readily put up by the farm-labourer and the stack-thatcher. The divisions are made in the same manner. A hurdle stuffed with straw answers the purposes of a door. The building is an ingenious makeshift, much better than it looks ; for the ventilation is secured through the thatch, both roof and sides, while all is weather-tight and snug. But the objectionable form of it is that which has but one door, the den being about 30 feet long, and made to accommodate (?) a large party of men, women, and children. The width is six feet, and the height that of the sheep-hurdle at the sides, and in the middle barely high enough for a man to stand upright. Where the divisions are properly made, and care is taken not to overcrowd, the sheep-gate hopper-houses are by no means the worst.

" Another exceptional case, and a bad one, is the shed, thatched in a similar manner to the former. The arrangements made by a party of 28, who occupied one of these places, were described to be as follows :—There was no internal division of any kind. In one corner four young men slept ; then came the children, next the married people, and in the opposite corner were the girls. The shed was not crowded, and its occupants were tolerably well conducted ; keeping good order till towards the close of the hop-picking, when some of them took to drinking, and disturbances arose. We forbear commentary on the effects, in a moral and social point of view, on the people who found a lodging of this kind for more than a fortnight.

" There are also instances in which sheds constructed for cattle are appropriated to the hop-pickers. At the best such an arrangement is to be deprecated, and, generally, the buildings are of use for storage purposes. If, however, great care is taken to have them thoroughly well cleaned before the people come, objection is lessened. Where that care is wanting,

and the immigrants turned into them 'as if,' such was the exclamation of one of them, 'we were so many cattle,' is it strange that their conduct is little better?

"Notwithstanding all discomforts, so invigorating is the occupation of hop-picking, so healthy the change from town to country, that illnesses are rare. But still there is the risk, and, although every precaution is taken, as soon as a case is known, to remove the sufferer to the nearest union, it is not among the least blessings attendant on the close of the hop-picking to count freedom from infectious illness as one. In 1849 the fearful scourge of cholera broke out among the immigrants at East Farleigh. Forty deaths occurred, and, but for the unwearied exertions of the vicar and his family, a much larger number must have died. Those exertions will long be remembered, and no account of the efforts made on behalf of these poor people should omit mention of them.

"Our observations on the supply of food will be necessarily brief. With the notion of buying at a bargain possessed by so many of the town poor, when they come into the country, it would be matter of surprise if imposition in the sale of meat, and adulteration in other articles of food, were not practised. Where the water supply is not pure and good an undoubted and grave abuse is suffered to exist.

"It is only justice to the hop-growers to state that they are not generally insensible to the necessity of securing, so far as they can, the proper accommodation and food of their workpeople. Many efforts have been made with this object in view, and in some cases with good results. But, from the vagrant character of the uncleanly and ill-fed classes, the difficulty is great. It is increased by the utter disregard for their good shown by the objects on whom improvement is attempted. A worthy landowner, who resided occasionally in the county of Kent, shocked at the immorality permitted by the arrangements, provided and numbered separate apartments for married and unmarried people; but on visiting his hopper-houses one Sunday afternoon, he found them living, as they described it, all higgledy-piggledy. His remonstrances were derided, and nothing could be done.

"Nevertheless some steps may and should, we think, be taken, and from knowledge of the hop-growers, we state with confidence that, if a practical remedy could be devised for some evils pointed out in these pages, it would be adopted. Inquiry into the state of the accommodation proves that it is better now than in former times. When bands of Irish labourers roamed the country in quest of work, the double harvest of corn and hops in Kent was a profitable adventure to them. They slept anywhere—in barns, outhouses, and waggon-sheds, and sometimes under the hedgerow. But, as competition forced the growers to bestir themselves and adopt the best means of securing the crop, the reduction of time became an object of importance in hop-picking. More labourers were wanted while the Irish supply fell short, and at length ceased altogether. Accommodation was at first and excusably inadequate; but, now that the numbers annually required are ascertained, insufficient provision on all points is not easily justifiable.

"Much of the evil arising from overcrowding and from faulty structures would be checked if an inspector of these tenements was appointed who would certify their fitness and the number each should contain. The refusal of a certificate in cases such as have been described in this article, with the power to inflict a fine of small amount, would protect the immigrants from the evils to which they are exposed, and the hop-grower, on the other hand, would find his account in a less defiant and abandoned class of labourers. The same regulations should be applied to tents, respecting the number of inmates, and security against wind and wet above and below, and to any tenements, whether waggon-shed, barn, or sheep-gate house.

"The following regulations should be obligatory:—

(1.) That the lodgings, whatever the materials, should be weatherproof.

(2.) That a minimum space of 16 square feet should be secured to each adult, two children to count as one adult.

(3.) That such screens or divisions should be used as are necessary to protect occupants from indecent exposure.

(4.) That a sufficient number of cooking houses and of privies should be provided.

(5.) That where the hopper-house is used for other purposes at other times of the year, it should be cleaned, and the ground adjoining made free from any offensive matter.

(6.) That sufficient water should be provided.

"The inspector might also attend to the accommodation assigned to hop-pickers in the unions or provided by the police, and his attention would be directed also to the meat and other articles of food exposed for sale or sold to the hop-pickers, so that punishment might be fairly anticipated in cases of fraud. We have known diseased beef sold at 2*d.* a pound to the occupants of a hopper-house numbering upwards of 80 persons, many of whom were ill, in consequence, as they stated, of their bargain in beef.

"Regulations of such a kind as these would not be found to be of an inquisitorial character, neither would there be difficulty if they received the support and sanction of the Poor Law Board. The expense would be but trifling, and be more than compensated, independently of stronger reasons, by an improved state of accommodation and an attention to the requirements of the workpeople, which would on their part exercise its natural influence for good. We would not interfere with their sleeping arrangements; such interference, however, well meant, does more harm than good.

"As a further means of improvement, a middle-man or agent of a better class than those at present in the field is much wanted to supply the hop-pickers required. At present this is done by 'binmen,' who get their friends together and make a party which constitutes the company. The binman knows that the worse the hands are, the longer the picking will last, and here is certainly some inducement against the selection of good ones. Still we doubt not that efficient agents would be found among the binmen and persons living among these classes. They would obtain lists of names of the hop-pickers, striking off such lists, as far as possible, all persons of disorderly and turbulent character. Such a step would encourage many more poor but respectable persons to come than do now, and a great improvement might be perceptible in two or three years. That the classes from which the selection is made are among the poorest is quite evident; for persons who have a settled trade or occupation cannot, as a general rule, afford to leave it for the season. There is not much force, we think, in the objection that such agents would get the poor into their own hands; competition would check such an evil, at least, as much as it does at present among the binmen.

"A bench and a table and lantern might, we hope, be assigned to each compartment by the owner, without the danger of their being purposely broken. Much inconvenience is felt for want of articles of this kind, and a small payment exacted from the binman would cover any wanton damage they sustained.

Under these conditions a fortnight or three weeks' sojourn in a 'hopper-house,' though none of the most desirable, would be deprived of much of an objectionable character."

132. [The Society for the Employment and Improved Lodging of Hop-pickers was formed at Maidstone on October 25, 1866, in pursuance of a memorial signed by the late Archbishop of Canterbury, several of the nobility, and a large number of the gentry, clergy, and hop-planters of the county. Its objects were twofold,—

(1.) To establish a system of engaging hop-pickers by means of respectable and trustworthy agents living in the towns whence they come.

Kent

Mr. Stanhope.

g.

(2.) To promote the supply of better lodgings and accommodation for them].

The following extract is from the report for 1867 :—

With respect to the lodging of hop-pickers the Committee have the satisfaction to state that an improvement has taken place. Many of the alterations already made in them are directly traceable to the influence of the Society.

* * * *

The plan of engaging for the "picking" through an agent was favourably regarded by the pickers. Great numbers applied to the agents for employment, preferring, as they commonly stated, to engage under the Society to the means hitherto adopted by them of obtaining work. There was not, however, the same ready response on the part of the hop planters to the Society's offer to engage the pickers. Many were desirous to see the experiment of engaging hop-pickers by means of the Society tried, but few were willing to run the risk of making the experiment for themselves.

In addition to the natural want of confidence in a new and untried system, was the ominous prospect of there being no hops to pick. For months appearances were so much against the chance of a crop, that it was commonly supposed that the duties of the agents would be restricted to their keeping the people at home. It was not till the middle of August that it became probable that the services of immigrant hop-pickers would be required in any considerable degree.

The difficulty arising from the fickleness of the hop proved embarrassing to the agents at the outset, inasmuch as they were under the necessity of ascertaining their resources of supply before orders to engage pickers could be received. Further, from the unusual lateness of the crop, and the fears of many of the work-people that the picking was in full progress when but one pocket of new hops had found its way to the Borough, a great number of poor persons left their homes in search of employment. Although a public notice from the Society warning none to go to the hop district on the bare chance of employment might have done good service, it was, after careful consideration, determined not to venture on such a course in our first year.

133. Extracts from the Paper of Recommendation issued by the Society in 1867.

The hopper house is a building containing 8, 10, or more rooms, each with external entrance, and providing accommodation for six or more persons in a room.

The Committee recommend that a minimum space of 16 square feet should be allowed for each adult picker, two children, exclusive of infants, to count for one adult.

A convenient size is a room 14 feet long by 12 feet wide for ten pickers, or 7 feet by 12 feet for 5; and it is recommended that at least half the number of rooms should be of the smaller size. The floor may be boarded in the space assigned to the beds. Screens of wood or iron may be also supplied 6 ft. by 4 ft. for divisions between the beds. They are preferable to screens occasionally made by the lodgers. Fasten to the wall by hook and staple.

A square of stout rough plate glass about 18 in. by 14 in. in the roof is recommended.

If a window in the wall is preferred, the same should consist of an opening protected by bars, with a shutter to close when required.

Doors with a bolt inside and padlock on the outside. If opening outwards (by which arrangement internal space is saved) to fasten by a catch to the wall.

Sliding doors may be used where the expense is not an objection.

Shelves in the corners, or cupboards, would be useful, and a few pegs for hanging clothes, &c. should be provided. Iron sockets driven into the walls for holding candles are recommended. Sconces to hang on the wall, or lanterns (which may be purchased at a cost of 1*s.* 6*d.* to 2*s.* 6*d.* each) may be supplied.

The binman to be responsible for injury or loss.

The cooking houses should be in the proportion of one to two bin's companies. A lean-to roof over the fire-place, covering a ground space of 7 ft. by 9 ft.

Fire-places to have iron bars for the pot-hooks.

Although conveniences are more commonly built for the lodgers than formerly, the accommodation is far from being sufficient. One for each company is recommended.

While all reasonable care should be taken for the encouragement of morality and good order among the hop-pickers, great caution is needed in dealing with the arrangements which the people prefer to make for themselves. These should not be unnecessarily disturbed.

134. Extract from Second Annual Report, in 1868.

Enquiries were set on foot in the course of the summer by the Commission on the Employment of Children, Young Persons, and Women in Agriculture, into the state of the immigrant hop-pickers of Kent. In the belief that the assistance of the Commission will expedite the reform for which the Society is labouring, your committee have rendered it such help as lay in their power.

Nearly 400 pickers were supplied by the Society's agents for the season, being an increase of 60 on the number supplied last year. Considerable improvement in their efficiency is reported. In their behaviour, whether on the farm, or at the railway stations, they have been, on the whole, exemplary. The only station in the district, where the number of the Society's pickers rendered the services of an agent desirable, was at Wateringbury, at which place the advantages of such control were established by Mr. Leach, the agent, to the satisfaction of all parties concerned.

With reference to the usefulness of the Society in difficulties arising with the work-people, the following instance deserves notice. An owner of hop land in Wadhurst was under the necessity of resisting demands made on strike, when about half through the picking. All the hands were discharged, and application was made to the Society for a fresh supply. An inspection of the lodgings provided for them was thereupon made, and the number of pickers required promptly sent from the agency in Westminster. The work was completed to the satisfaction of the employer.

The suggestion to issue notices in London warning persons not to leave their homes and tramp the district on the bare chance of obtaining employment in picking hops, was not adopted by the committee. A large number, however, of poor persons taking friendly counsel with the Society's agents, remained at home, either altogether or till they heard of engagements. But for this precaution, they would have found their way into the district two or three weeks before the commencement of the season, as others less fortunate did, and augmented the distress which must exist in a greater or less degree, so long as the custom of hiring pickers from the road is maintained. The evil of this custom was pointed out at the first annual meeting by one of the speakers, and has been spoken against elsewhere as a premium on vagrancy. The remedy for the main part of this evil is, for growers to adopt the rule of engaging pickers either by means of the Society's agents, or by better agents where they may be had.

A valuable check on disorderly behaviour has been secured by placarding the district with notices that orderly hop-pickers can be promptly sent by the Society to any point required. By the assistance of Mr. Knight, the out-door superintendent of the South-eastern Railway Company, to whom we must again express our acknowledgements, these notices were posted at every station frequented by the hop-pickers. The improvement in their conduct both last year and this is in a great measure to be attributed to the wholesome hint thus given to them.

The land under hops according to the excise returns in 1861, was 47,941 acres. The acreage given by the Board of Trade for the present year is 64,488, being the highest on record. No less than 41,087 acres are returned from Kent, being an increase in the county of 14,000 acres since the repeal of the hop duty. These returns are obtained, so far as possible, by the Board of Trade, from all growers, without limit as to acreage.

The hop-pickers' railway traffic is now reduced to a system, and under the local supervision of Mr. Raggett, station master of Maidstone, is greatly improved.

The following returns have been supplied by the South-eastern Railway Company :—

Hop-pickers from London by Special Trains.	*Returned by ditto.*
1865—11,090	12,000
1866—11,000	13,000
1867— 8,777	10,694
1868—14,476	17,288

No account is taken of hop-pickers who travel by ordinary trains.

On the 5th of September, when the picking was well advanced, the agents reported that upwards of 1,300 hop-pickers (out of a number of about 3,000 who had applied to the Society for employment) had remained in London and that their services were available if required. There does not therefore appear to be a probability of a deficiency in the supply of hands, which was at one time apprehended by the growers. Efficient organization for such supply, and good treatment for the people, will, it is reasonable to anticipate, obviate difficulties on this point.

[Agents were appointed in Lambeth, Bermondsey, Golden Lane, Westminster, Seven Dials, Woolwich, Deptford, and Maidstone.]

Your committee are assured that a thoroughly efficient staff of agents will, at no distant date, secure to the Society a large measure of support, with the best results not only to the immigrant hop-pickers, but to the growers themselves. The duties of the agents are anxious and laborious. They would be rendered easier if all orders for pickers (which are executed conditionally on pickers being wanted) were sent to them a month before the commencement of the season.

With reference to the lodgings, the influence exerted by the Society, both directly and indirectly, continues to produce good results. Bad lodgings are no longer assigned to the large majority of the immigrants, but are the hard lot of the minority. It is therefore still incumbent upon the Society to appeal both to the owners and occupiers of hop lands to unite together in rescuing the poor from the degradation, and the district from the reproach, caused by permitting lodgings in which morality, decency, and comfort cannot be secured.

135. On the 4th of September 1868 I visited the farm of J. Johnson Ellis, Esq., the Priory, East Farleigh. Mr. Ellis employs 1,400 to 1,500 adult hop-pickers, besides young children. The greater part are from London, and at least 1,200 had written beforehand to his bailiff, generally through the agency of the binman, who undertakes to bring down a bin's company.

The bailiff is, as it were, the commander-in-chief, having under him three masters of the hop-garden. The system is to fix the "tally," or price per bushel, for each garden before work begins. This is read over to the pickers, who are bound over for the whole picking. If any leave before the end they are paid off according to what they have earned. The tally fixed beforehand is rarely adhered to throughout; but if Mr. Ellis finds that the hops are coming down badly he anticipates complaint by altering the rate of payment. Mr. Ellis's hopper houses are mostly of brick or stone, with a roof of tiles so placed as to afford a ventilation which cannot be stopped up. They are divided into rooms, mostly 12 feet square and 9 feet high, containing from 9 to 12 persons each. In one case his house is in two stories, being intended to serve for cottages if necessary. A tin candlestick is supplied to each hut. Wood and straw are given out daily. The cooking places are very simple and excellent, being a lean-to against a stone wall, with an iron bar to swing a kettle on. Privies are provided, about one to every 30 or 35 people.

The number being this year greater than usual, Mr. Ellis has also 9 or 10 bell tents, and a very large hut of tent cloth, with walls of bine and hurdles. This is the only place where the accommodation is not very good.

A medical man attends every morning, and anything ordered by him is immediately supplied.

136. *Henry Bannerman, Esq.*, Hunton Court.—"At every leaving year my pickers are told, if they "wish to be employed next season they must apply "by writing before the 1st of August. Any who have "been disorderly or ringleaders in strikes are informed they need not apply. By adopting this "course the same hands are readily obtained year after "year, and some of the worst characters weeded out.

"Here there are five separate gangs, over each of "which there is a manager placed, with an adequate "supply of bookers or clerks. At the beginning of "the work, or very shortly afterwards, a list of rules "is read in the hearing of the assembled pickers, which "if not objected to constitutes a legal contract. In "one of the rules *the tally* agreed on is named, and it "is specified that if any person leave the work before "the picking is concluded he is liable to be paid off "at 1*s.* for 12 bushels, instead of the tally named, "which is often 5*s.* or 7*s.*

"When a strike occurs without sufficient cause, the "best way to stop it is to single out one or more of the "ringleaders, and pay them off. In the event of the "hops going off badly, owing to disease or change of "weather, the people will naturally become dissatisfied "with their earnings; under such circumstances the "best course is to lower *the tally* voluntarily at once, "before being compelled to do so.

"Several hundred home pickers are employed here, "who seldom avowedly join in a strike; but it is "surmised that they are not seldom at the bottom "of it. Their experience enables them to discern the "symptoms of an approaching change in the hops; "they foresee that they are about to go off rapidly, "and *must* be either picked or lost. It is in such an "emergency that the grower is completely at the "pickers' mercy."

137. *Mr. E. Leach*, Scripture reader, and agent to the Kent Hop-pickers' Society, 30, Bermondsey New Road, S.E.—For the last seven years I have been engaged by the vicar of Wateringbury to work as Scripture reader among the hop-pickers in his parish. The pickers who went this year to work in that parish for Mr. Arthur Fremlin and Mr. Goodwin were sent down by me from here as agent for the Society. Last year I sent some to Mr. Goodwin, and all of them who go again this year want to return to him.

In that district I have seen every sort of accommodation for the pickers. I prefer wooden huts, with small partitions, such as Mr. Goodwin has, in each of which there is a sort of raised bed. His 'wigwams of heather' do not protect them so well from exposure to the weather. Some of the new brick hopper-houses are very good, such as Mr. Fremlin has built. One woman was confined in one this year, and, as he has put up rough wooden bedsteads, was very comfortable.

He has also some tents, but in damp weather these are not so satisfactory.

Some of the pickers in this district are miserably lodged. They are given straw and hurdles, and make what shelter they can. In one such hut there were 40 persons this year.

One great difficulty in the hop gardens is that of getting good food, and even when they have it there is often a want of a shelf or a locker in which to put it. The pickers who have been hired through the Society urge to me, as their chief reason for preferring this mode of hiring, that they have not to

Kent.

Mr. Stanhope.

g.

leave London till they have a certainty of employment; and, secondly, that the character of their companions is very much improved. In consequence of this I find that a higher class of people are willing to go for the change of air, and would even pay a small sum to get a decent lodging there. Mr. Fremlin tried the plan of giving me a sum at the end of his picking to distribute among those who had behaved themselves well, and this, I think, will have considerable effect.

But another advantage is that they are saved from the extortions of the bin-men or gangers. In 1866 several women told me that their bin-men never gave them any account of what they earned, but paid them what he liked. Sometimes a costermonger takes them all down in his cart, feeds them, and gives them fixed wages, taking himself the rest of their profits. In other cases the bin-man expects to be treated or receive some payment for taking them down.

138. *Mr. F. Duly*, relieving officer, Maidstone.—The hop-pickers that I get in my district for relief come to this place on "spec.;" they are mostly the scum of London. I have averaged during the past week 100 a night who have come for orders. The majority that come are not accompanied by children. They describe themselves as men who can "do anything" for a living. Another class consists of the poor that come from the London unions, and they state (with what truth I don't know) that they are forwarded by the officials of those unions to come here for change of air. Some come in a terrible state, with ulcers or sick, and they go at once into an union, and are not fit to work. I don't think that any agency system that can be devised will check the evil of those people coming into the district. They don't care about hop-picking in particular; they come to pick up what they can, and follow the hop-pickers, just as followers go with an army; nor would it prevent strikes, because hop-pickers in possession of a garden would never consent to be turned out, except by force.

139. *Mr. J. T. Hatch*, land agent and occupier, Lenham.—To me setting the hop "tally" after the work is done is wrong in principle. When people make a bargain each should have the option of undertaking the job at a certain price or not. At the same time I believe the employers generally pay what is just and right.

We can't fix the "tally" before we begin, because the yield is unknown, but the fairest plan seems to me to be to fix it after a day or two's picking.

The importation of labour for hop-gardens has very largely increased, and makes the difficulty of preventing strikes greater. The only way is by having an excess of supply. There are plenty of men, but you can't get them at a minute's notice. In some cases no provision is made for their accommodation. It won't do to ask too much where they are put. To show the class that come down to us, I found at the Hollingbourn Union Workhouse that there had been 289 casuals in one week (all hoppers), of whom only two had a sum amounting to 2*d.* found upon them. The great majority had nothing, and were partly without clothing. It is right, however, to mention the migratory hoppers from London and other large towns that are engaged by the planters, *before they come* into Kent, are of a much better and less indigent class.

140. *Mr. G. Turner*, farmer and hopgrower, Kemsing.—Most of my pickers write to me beforehand, and I fill up with those on the spot. I want 110 "bins." It is very difficult to know exactly your number till the time comes, as many of those who engage do not come. After harvest this year I engaged no pickers; I don't suppose more than one or two are now working for me. Many of these men who must come for harvest, cannot go back to town between harvest and hopping, because their lodgings are given up. I fix the "tally" before they begin to pick. I find no difficulty in it, and I have often been all through my picking on the same tally. So many of my men are in the habit of coming every year that I have less difficulty in keeping them in order. I know that many growers fix the "tally" at the end of picking. This does not seem to me fair upon the pickers, as all should know beforehand what they are working for.

141. [Summary of Evidence as to the mode of hiring of hop-pickers.]

Four hundred were hired through the Society; almost all the rest by letter, generally through the binman or tallyman. Four employers say they pick them up on the road. Previous agreements are rarely entered into. By the returns from West Kent, it appears that the "tally" or price for picking was paid on the second or third day after beginning at latest, or before the commencement of each separate garden. In East Kent the price does not appear to be fixed till the work is done, when it is so fixed as to give average pickers from 1*s.* 6*d.* to 2*s.* 6*d.* a day. Some make it a condition that in the event of any offence being given by the pickers, they shall be paid off at a greatly reduced price.

Strikes are mainly complained of in the West. "Firmness and kindness," are the usual remedies recommended.

Mr. W. A. Fremlin, says, "No means are so "powerful as the universal engagements of pickers "through an agent, particularly the Society, and "keeping a black book to be handed to the agent "that bad characters may not be sent out another "year." Others suggestions are, "combination "among employers not to employ those that strike;' "that masters should not trust so much to their "bailiffs;" "the closing of all beer-houses during "the whole of the Sabbath;" and "an arrangement "to be made before the bench of magistrates for the "rate of payment to be made after picking."

142. Evidence as to the accommodation of the hop-pickers in the under-mentioned parishes.

BOUGHTON-ON-BLEAN.

Mr. Berry (90 immigrant pickers).—"Hopper-"houses of wood with felt roof, divided into rooms "(say 10 ft. × 12 ft., × 12 ft. high), but this the "families arrange among themselves. Out-buildings "sometimes used. A lantern, straw, and fuel "provided."

BOUGHTON MONCHELSEA.

["90 acres of hops in the parish. Half the pickers at least are lodged in old barns and lodges, and some rough houses built of loam and thatch. The only partitions are hurdles put between the beds, leaving them to twist straw in, if they like; they seldom do so."—E.S.]

BENENDEN.

(Number of foreign pickers in parish, 500.)—[In many cases straw and hurdles are given, and conical huts are built by the pickers themselves; sometimes they are lodged in outbuildings. Mr. Landsell has one wooden hopper-house with partitions; so has Mr. Harris; there are no others in the parish.—E.S.]

BRABOURNE.

Mr. Andrews (12 families).—"Six brick hopper-"houses, and six of straw; no furniture."

BRENCHLEY.

Mr. G. Hammond (50).—"Lodging in a large "barn with partitions; some brick hopper-houses; "rooms 8 ft. × 10 ft., with locks. Clean straw and lanterns."

Mr. Manwaring (200).—"Lodged in large barns, "partitioned with sheep gates, generally with straw "between them. They are very healthy. Straw and "lanterns provided."

Mr. W. Noakes (20).—"Cattle lodges made warm "with straw and cleaned. Straw, lanterns, and pails "provided." Mr. Noakes adds, "The enquiry I think "a very necessary one; inspection and report will do "much."

CHARTHAM.

[On Mr. Martin's farm, 10 wooden houses with asphalte roof, good. One privy and no cooking house. —E. S.]

CHILHAM.

Mr. J. Day (80).—"Some wooden huts with "asphalte roof in a row, others moveable. Size, "10 ft. × 10 ft., height, 10 ft., containing four adults "and children. The moveable huts preferred. Some "are put into a barn and lodges. Lanterns pro- "vided."

Mr. J. Hambrook.—"Wood, with felt roofs. Size "of rooms, 9 ft. × 10 ft., height, 11 ft. In cases of "necessity, some are lodged in barns, &c. with "partitions."

CRANBROOK.

Mr. G. Neve (150).—"Put into one large barn "with sheds on two sides. In the parish about 1,000. "There are some brick hopper-houses 10 feet square. "Sometimes with a wooden floor one foot from the "ground for a bed. Lanterns occasionally provided. "Barns and sheds often used with or without "partitions."

[At the union house there are sometimes 60 or 70 in the casual ward at the hop-picking season. They are then lodged in the stable.—E. S.]

DITTON.

Mr. P. Maitland (100).—"Brick houses with iron "or slated roof, 16 ft. square, containing from six "upwards. Where the number is large, barns are "sometimes used."

EASTLING.

Mr. B. Murton (30).—"Brick and wood houses, "10 ft. × 11 ft. Two families usually take one house. "Shelves and hooks fitted. Used as storehouses for "tackle, ashes, and guano at other times. They are "cleaned and lime washed."

EAST FARLEIGH.

[For Mr. Ellis' farm, *see* Ante, No. 135.]

Mr. Lewis (270 without children).—"Clean and "dry hopper-houses, with earthen floor (10 ft. × 12 "ft.). Each will contain six adults without children. "One set has a slate roof, with the slates overlapping "for ventilation; the other with asphalte roof and a "covered vent hole. We keep roots in them in "winter, or lime. Before hopping they are lime- "washed. Straw and fuel provided. In these I put "families. Tents and a cart shed are kept for single "men. Sometimes, if we require more than usual, "we lodge them in cattle sheds, divided by hurdles "wattled with hop bines; never in barns."

WEST FARLEIGH.

[On Mr. Jackson's farm, two tents, four hopper-houses of wood, and one of straw. Cooking house, the church yard wall.—E.S.]

FRITTENDEN.

"Many immigrant hop-pickers. Hopper-houses very uncommon."

HADLOW.

Messrs. Cox (150).—"Brick hopper-houses, 14 ft. "by 12 ft.; height to eaves, 6 ft. 9 in. Each intended "for 12 persons."

Mr. C. Leney (600 to 700).—"Some lodged in "tents; others in houses thatched or tiled. Each "tent, 10 ft. by 8 ft. Decency is a word few under- "stand the meaning of."

HORSMONDEN.

Mr. B. Buss (100).—"Brick and tile houses, with "one family in each; straw and lanterns provided. "Some are lodged in barns with partitions."

HAWKHURST.

Mr. Piper (200).—"They build their own huts on "the ground generally. But there is a brick cattle "shed, in which they make their own partitions. "They cook in a corner of the field."

HUNTON.

[On the farm of Henry Bannerman, Esq. (1,000). —Brick hopper-houses about 12 ft. square, slope of roof beginning at 6 ft. high. In one row of 16, the two outside ones were fitted up as kitchens. Each contains a bin's company, viz., eight pickers and the polepicker, besides any children they may have with them.—E.S.]

Mr. W. Mercer (100).—"Brick and tile hopper- "houses. Whitewashed before use. Some few "lodged in outbuildings with partitions."

Mr. T. D. Shafto (80).—"Brick and slate hopper- "houses, cleaned and whitewashed if necessary. "Families and single men lodge separately."

ICKHAM.

(400.)—"Generally lodged in the cow lodges and "barns; there may be temporary partitions erected. "There is one hopper-house in the parish. Perhaps "inspectors might be appointed armed with some "powers." [S. M. Hilton, Esq., High Sheriff.]

KEMSING.

Mr. Turner (110 bins).—"Has a boarded building "fitted with partitions; others live in the buildings; "divided with hurdles and straw."

Mr. Stoneham (100 pickers).—"Has two tents with "two families in each; one family in a sheep waggon, "and one cart lodge thatched with straw and "hurdles."

MILTON CHAPEL.

[*Mr. R. Lake* has 20 brick and tiled hopper-houses, back to back; clean and good; water supplied by a cart; two privies, of which he "compels the use." Good cooking place.—E.S.]

EAST MALLING.

(600.)—"In some cases odged in barns, &c. with "thatched partitions."

MEREWORTH.

Mr. T. White (540.)—"Has 40 houses of brick "and tile, 10 ft. by 12 ft., in which families and "friends of the parties arrange as they like best. In "winter stores the wooden picking frames in them. "For the remainder of his pickers has tents."

NETTLESTEAD.

Mr. A. White (400).—"Brick and tile hopper- "houses, and some of wood; a few live in tents, "others in carts or any outbuildings."

[On Mr. R. Allen's farm are six wooden houses near roadside.—E.S.]

PLAXTOL.

(800 to 1,000.)—"Some in barns with partitions "of thatched hurdles; some in tents; others in brick "hopper-houses with six or eight in each dwelling."

PLUCKLEY.

Mr. Bacon.—"Bullock lodges with boarded par- "titions, cleaned and whitewashed; some in a barn "with partitions; straw and lanterns provided."

PETHAM.

[*Mr. A. Solomon* (has 63 baskets of pickers, that is, 126 adults).—Has 15 wooden huts with asphalte roof. No windows, and very hot. Partitions of wood and straw alternately. Water supply not *convenient.*

On *Mr. Hammond's* about 100 baskets are wanted. 12 wooden hopper-houses (say 10 ft. square), in most

Kent.

Mr. Stanhope.

cases re-divided by a straw partition. Seven very low and poor hurdle huts; one largeish straw and hurdle hut; one tent hut, built by themselves. In a corner away from the rest was a gypsy cart and three straw huts built by the gypsies. Good supply of water. No privies or cooking places.—E.S.]

SANDHURST.

(110.)—"Lodged in barns and outbuildings with "partitions cleaned before occupation; others build "tents either of straw or hop-bine. No special "hopper-houses."—[*Rev. G. Ridout.*]

SELLING.

Mr. Butcher (70 to 80).—"Some in cart-sheds with "partitions; others in wooden houses 10 ft. square; "number *in each* unlimited; wooden bedsteads. To "be used in winter as implement sheds."

Mr. E. Neame (400 to 500).—"Some lodged in "brick, wood, or iron hopper-houses, 9 ft. or 10 ft. "square. Six people in the smallest. A common "bedstead in most huts. Some lodged in clean "cattle-sheds. The pickers divide them them-"selves."

SELLINGE.

"The few foreign pickers here sleep in the cart-"lodges."—[*Mr. Andrews.*]

SUNDRIDGE.

Mr. G. Whibley (20 bins, that is, about 160 pickers).—"In cart-lodges with partitions, but often "they prefer to lodge in lots of five bins, as they "come together from home. Tenants, from the un-"certainty of their tenure, cannot be expected to "build hopper-houses."

SUTTON VALANCE.

(400).—"Some in barns, &c., others in wood or "brick hopper-houses.—[*Mr. J. Paine*].

WATERINGBURY.

Mr. W. A. Fremlin (300).—"Bell tents are much "used. In one case I have used a large cart-shed "this season, divided into small compartments for four "pickers each. I have also small hopper-houses about "12 ft. square for six or eight pickers each, and some "new ones $7\frac{1}{2} \times 9$ for four pickers. The latter are "much approved for small families, and, I think, a "mistake is made in building rows of hopper-houses "of uniform size, unsuited for families varying in "number. I provide board benches with bed of "coarse cloth stuffed with straw. The houses are "sometimes used for storing machinery, but are "cleaned and whitewashed."

[*Mr. E. T. Goodwin* has 15 conical huts of wood thatched with heath (12 ft. in diameter at base), five or six inmates in each. A ventilating pipe always stopped up by inmates. Also a wooden moveable hut with six compartments (each about 8 × 4) for married couples, with a bed and seat in them. Very comfortable.—E.S.]

WROTHAM.

Mr. Carter (250).—"Frequently lodged in barns, "&c., divided by the pickers themselves. Some "timber houses with slate roofs."

Mr. S. Rutley (80).—"In lodges and outbuildings "with temporary partitions. A tenant would pay "a fair per-centage on a landlord's outlay for hopper-"houses."

Mr. W. Jull (300).—"In lodges and cart-sheds "with partitions. I am bound to keep a certain "number of acres of hops, and my landlord ought to "provide good accommodation for the pickers, on "which outlay a tenant would pay interest."

YALDING.

Mr. R. Alexander (60).—"Brick and tile houses "for six persons each, annually cleaned and white-"washed. My pickers come in sets or parties, and "in those occupy the houses. To interfere with this "would provoke needless discontent."

[On Mr. S. Waterman's farm were three good bell tents of straw. The mass of the hop-pickers lived close to a road under the lean-to round a barn; these were small and unfit.

On Mr. A. Ward's farm were eight straw and hurdle houses on three sides of a square; entrances 4 ft. high; tumble-down and bad cooking places back to back with one of the rows.

On another farm were eight wooden houses large and with cooking accommodation; other pickers were lodged in a barn, with three doors, and made up with hurdles and straw. Cattle yard outside filthy.—E.S.]

143. [Privies were not provided in 19 cases, and in 11 in very insufficient numbers; in six they were provided and stated not to be used, in six others it was not stated whether they were used or not. In only one or two cases was any attempt made to separate males from females in the use of them. The general plea was "the people hardly know how "to use them," or "they would be too dirty for "others," or "there are plenty of secluded places for "them in the woods or hop-gardens." The state of filth in the neighbourhood of some gardens is therefore very bad.

Cooking houses were more or less provided on 15 farms, and in 11 to a very insufficient extent. In 14 no provision was made, but they had to cook in the open air.—E.S.]

Cheshire.

CHESHIRE.—EVIDENCE.

144. A meeting of the Cheshire Chamber of Agriculture was held at Crewe on Thursday, February 4th, at 11 a.m., to meet the Hon. E. Stanhope, Assistant Commissioner. Sir Philip G. Egerton, Bart., M.P., took the chair, and there were upwards of 60 gentlemen present.

Mr. Stanhope, in his statement, referred to the following points as especially requiring the attention of the Chamber:—

1. Education.
2. The employment of female farm servants.
3. Cottages.

The following letter from Lord Egerton of Tatton was then read:—

(Copy.)

"Brighton, February 2, 1869.

"Sir,—I regret that my health does not allow me to attend the meeting to be held on February 11, for a conference with Mr. Stanhope. I have no doubt, however, he will receive all the information relative to his inquiry from the members present, and I could add but little to it; should he, however, wish to know my views, you are welcome to place this letter in his hands for that purpose.

"In my part of the county I should say that boys under the age of 12 are seldom employed except on very particular occasions, and I should see no objection to that limit being placed on the understanding that they might be occasionally worked for hay harvest, potato getting, *if they have a certificate of having been at school for two or three years.* There are in my part such a number of excellent schools within reach of every child, that either the parents or the children are to be blamed if they have not received proper education, and in the Altringham Union the guardians always insist on the attendance at school of all children who receive out-door relief (although it is not absolutely legal), and the relieving officers get the certificate. In many schools I should say the education goes further than necessary, as I find in my schools that scarcely one of the children of labourers return to farm work, but aspire to be clerks or mechanics ; and I do not think for 15 years one of the half-time boys I have had from the age of 12 to 14 has remained in my service as a labourer. This, however, is the natural consequence of the neighbourhood of a town like Manchester, and the desire to rise in life which one cannot find fault with. Women, except in hay and corn harvest, and sometimes potato getting, are but seldom employed in out-door labour, and then not to any excess that may be hurtful. Such, at least, is my experience in my part of the county. If I can be of any use to Mr. Stanhope in giving him any other information, I shall be happy to do so, if he will write to me here; but naturally those who are permanent residents in the county know more. I hope you will have a good meeting.

"Believe me,

"Yours faithfully,

(Signed) "EGERTON OF TATTON."

"Mr. Rigby."

Mr. Slater, of Woodford Hall, entirely agreed in Lord Egerton's letter, and thought education very much neglected in the country. Believed it to be owing *to the neglect of parents*, and not to want of schools. Objected to any legislation upon the employment of children in farm labour, as all boys ought to work regularly at 12 years of age, and before that time at occasional labour, as it is useful for them to do. Said that the charge of a low state of morality among farm servants is true, and that it is the fault of employers, and that the remedy is in their hands.

Major Egerton Legh thought no child ought to be employed regularly before 12, and that then there would be no difficulty about education. Women are very little employed in the fields, except Irish, from the nature of the cultivation. The low state of morality among farm servants is partly due to the landlords, owing to the bad construction of the cottages in some cases ; but that great improvement is taking place in this respect. The key ought not to be given to them on Saturday night, and characters ought to be required. Improvement is taking place. As to cottages some people go too far. Every cottage should not have three bedrooms. Easy access to water is advisable.

Mr. G. W. Latham, of Sandbach, has had special opportunity of observing combined labour and education in the Reformatory, where all the boys are expected to receive education only for two and a half to three hours a day, and to work the rest. He is astonished at the progress there made, but the system does not meet the difficulty of forgetfulness. Approved the plan of a certificate of proficiency before a boy is allowed to work, and would like to see the national schools open in the evening from 5 to 7 as a rule. Thinks the morality of farm servants will never be improved until the abominable system of hiring farm servants by the year is put an end to.

Mr. J. Aston, of Brassey Green, began to write himself a little at 8, and left school altogether at 12, when he was able to milk his share of cows. Thought children may be best educated by physical labour.

Mr. Bateman, of Chorley, thought ordinary employments should be blended with mental improvement. Children are, however, kept at school too long in many cases, especially girls. Thinks early training very necessary for boys. Has education mended the population? It has increased pauperism and crime, and the charges for both, and has made the scarcity of labour greater.

Mr. Dutton, of Standhorn Hall, alluded to the difficulty of religious differences. Said that there is a lamentable want of education in many places, and of the co-operation of all classes in the object. It is not the want of schools, but a dislike to the present system of management.

Mr. Swetenham, near Congleton, considered that almost all the children do go to school more or less. No force ought to be applied, or any limit of age required, but the management of schools ought to be altered.

Mr. Bushell, of Neston, did not agree with the last speaker. Neglect of education is to a great extent due to the ignorance of the parents. Would not venture to say that 20 per cent. of the adult population are educated at all. Some change is wanted, but thought that in some cases too much is attempted to be taught with the limited time which is available. Approved the principle involved in the Factory Acts, but pointed out some difficulties. Urged in some way the necessity of the education of every child.

Mr. G. Jackson, of Tattenhall, complained of the disinclination of parents to send their children to school. A large proportion in his parish will not come, even if paid for.

Randle Wilbraham, Esq., Rode Hall, wanted no legislation as to education, but the personal co-operation of the farmers ought to be obtained.

Sir Philip Grey Egerton thought the general feeling of the meeting was that elementary education up to 12 years of age is necessary to all children ; after that field labour must be entered upon, but, if possible, in combination with some education. The great difficulty in this county was the indifference of the parents. Alluded to his half-time system at Oulton. Did not think the Factory Acts in their present details applicable to agricultural districts.

Mr. Jackson, of Tattenhall, alluded to the immorality of farm servants, which was far worse 25 years ago. At that time an effort was made in his parish, in which all the farmers signed a paper that they would never allow the key of the house to be in their servants' hands at night. Thought great good resulted from this combination, and the system could easily be altered if every one would lock the door and put the key in his pocket. Yearly hiring is a necessity of dairy farms. Character ought to be required, but the difficulty is great owing to scarcity.

Mr. T. Oulton, of Eaton, admitted the low state of morality, but thought that the great evil of the yearly hiring was the crowding of the cottages at Christmas.

Mr. Bushell said that women are a good deal employed in out-door farm work in the peninsula of Wirral. Objected very much to the system, and attributed a good deal of intemperance to the neglect of the labourers' homes. Would prohibit all out-door labour of women, at any rate where there are children. Thought that the greatest loss of decency results from the overcrowding in the cottages.

Major Egerton Legh thought that some legislation could usefully take place as to thickness of walls, as to privies, and other details of cottages.

With a vote of thanks the meeting passed on to other business.

145. A meeting of the North Cheshire Chamber of Agriculture was held at Macclesfield, on Saturday, January 16th, to confer with the Hon. E. Stanhope, assistant commissioner.

The chair was taken by the Rev. J. Thornycroft, and there were present, W. C. Brocklehurst, Esq., M.P., the mayors of Macclesfield and Congleton, &c.

Mr. Stanhope having explained the object of the inquiry, a discussion took place, of which the following is a digest:—

Cheshire.

Mr. Stanhope.

g.

It was agreed that very few (if any) women or girls were employed on the farms in out-door field work on dairy farms. Girls from 14 and upwards are hired into farm service, and in many cases without any character being required. One gentleman said that an effort had been made to grapple with this "gigantic evil" by means of prizes to servants being given by the agricultural societies, but hitherto "with "very little effect."

With respect to the education of the children some difference of opinion was expressed, Mr. Myott thinking the elementary knowledge was fair, and the chairman stating that as a rule these children read and wrote very imperfectly owing to their early withdrawal from school; Mr. Carmel declaring that education had much improved during the last 20 years, thought that the difficulty of getting good servants had increased in the same proportion.

It was represented that the attraction of the towns caused very few boys to be employed on farms. They were seldom hired (except for bird-minding and potatoe getting on arable farms) before 12 or 13. As for men, Irish labour was much depended on. These men mostly lived in the large towns, such as Northwich, &c., and would often walk long distances, one as far as six miles, to work, rather than forego the advantage of living in a town where their children could be employed in the factories.

The gentlemen present connected with the manufacturing interest strongly advocated the extension of the Factory Acts to rural districts, and the trial of the system at Tatton was alluded to. But it was admitted by the mayor of Congleton that all the factory owners object to employing half-timers if they can do without them, and that the success of the system depended on the goodness of trade. He thought all children in agricultural districts could attend school every day from 4 to 6. The agriculturists present, on the contrary, thought it very difficult, one main reason given being the regular employment of boys in farm houses, and advocated night schools.

Cottages in the district were stated to be improving, although there was still great room for it. Gardens, generally about half of an acre, seem to be common. Some of the men had land for a cow also. Allotments very rare.—[E. S.]

146. Northwich Board of Guardians.

Meeting, Friday, January 22, Lee P. Townshend, Esq., in the chair.

In answer to questions put by the Hon. E. Stanhope, assistant commissioner, who was present to confer with the guardians,—

It was agreed,—

1. That it might be an inconvenience to farmers not to be able to employ boys before 13, or even 12 years of age; for although few boys go to continuous field work before that age, there are many small jobs by which they can earn something for their parents, and which are useful to them as a training for future farm work.

2. That in the opinion of the great majority of the guardians present, the actual state of education among children of the agricultural labouring class cannot be considered satisfactory, because of the non-attendance at school of a large number of children, and that want of means is by no means the principal cause. The feeling of the meeting was against any compulsion being applied to remedy this state of things.

3. With respect to women, it was stated that some English women do engage in farm labour, but they diminish in number every year. Some go with threshing machines, which in consequence of the new construction of the machines was not considered by the guardians a dangerous occupation. For the cultivation of the potatoes, Irish men and women living in large towns are mainly employed, and will often walk three or four miles or more to their daily work.

4. A strong feeling was expressed by some of the guardians present, and especially by the chairman and R. Dutton, Esq., that inquiry was greatly needed into the condition of the families living on canal boats, and also into the employment of women in brine works at Northwich and elsewhere (post 241–242).

TARPORLEY.

Population - 2,557; acreage - 6,508.

147. Notes of Meeting January 14, 1869.

PRESENT:

Rev. J. H. Cooper, rector.
Rev. F. Noyes, Rev. J. Douglas, } Curates,
Mr. Thompson, Mr. Leather, } farmers, Delamere.
Mr. Hinds, Mr. Prince, Guardian, Mr. Wade, } farmers, Utkinton.
Mr. Barnes, guardian, Mr. Burgess, farmer, } Tarporley.
Mr. John Vernon, Lord Binning's agent, Willington.
Mr. T. Cawley, Mr. Tollemache's agent, Bunbury.

Tarporley contains the hamlets of Eaton (465), Iddenshall (22), Rushton (342), and Utkinton (558).

It was agreed as follows:—

Boys are not regularly employed before 12 years of age on the farms, though boys even under are employed at bird-minding for a short time, or (on the arable farms) at two months of potato getting, or (in some cases) at setting. The great employment, however, for such young children is in aid of piecework taken by their parents. An instance of a mother being employed to tip and tail turnips, and taking children even as young as 6 or 7 to help, was mentioned.

Two gentlemen at the meeting represented an exceptional sort of farming in Cheshire, one (Mr. Thompson) growing potatoes on from 80 to 120 acres every year. Very few children stay at school up to 12, the majority leave it at 11. There is a night school, but here it is found to attract sons of villagers and such like rather than of agricultural labourers.

The district was represented as well supplied with schools. 12 years appeared to be the limit up to which most of those present thought it advisable that any restrictions as to labour should go, and it was thought that between 10 and 12 three months, or even six months, could be spared for schooling without interfering with the demands of labour. [The advantage of lending libraries, with the privilege of taking books out, was remarked on.] On the dairy farms it was thought they could best be spared in the winter; on the arable this appeared doubtful, and the gentlemen present thought it best that this should be left open to suit the convenience of each district.

Boys are not taken into farmhouses until after 12 years of age.

The attendance of girls is very much affected, and they leave very much sooner, in consequence of a large sewing establishment where their mothers are employed. On the dairy farms young girls are not wanted at all; on the arable (where potatoes are cultivated) they are as much employed as boys.

In Bunbury Mr. Cawley says he hardly sees one young girl employed in the year, except in the gardens and allotments. On the forest the potatoes are usually ploughed up, and a large number of women and children are required to pick them up. They are paid at the rate of 2*s.* 6*d.* a row, which would take some a day to do. If, however, they take children they can sometimes earn 2*s.* 6*d.* a day. Mr. Thompson would like to see the young children under 10 prohibited from coming, as they are hardly fit for the work. The potatoes are "hogged" up in heaps, which are sorted in the winter, when families are again required. Potato culture would be half destroyed if restrictions upon women and children's labour were very severe.

Girls are hired into farm service about 14 or 15 years of age, though younger as nurse girls. Such

servants are very scarce and difficult to get, the wages being doubled within five years. Characters are seldom asked for. Mr. Cawley says that in his neighbourhood half the servants would not go to a place if they were asked for characters. This system could not be broken through except by the masters agreeing to take a servant without a character.

The great scarcity of labour, and the necessity of such labour to assist the farmers' wives, causes a girl who is known to be a good dairymaid to be hired independently of her character. The girls are hired every Christmas, and perhaps half of them change places every year. Written agreements are not common. They begin at 3*l.* a year.

Women are employed on the dairy farms to milk morning and evening, at which they will earn 2*s.* 6*d.* a week.

The wages for ordinary labourers are 12*s.* a week. This would be the highest, and they drop sometimes in the winter to 11*s.*, or in exceptional cases to 10*s.* a week.

Mr. Thompson remarked on the advantage of employing men regularly, so that they may know they will not be turned off at any moment. Where men who are sometimes married are boarded in the house, they will generally get 8*s.* in addition to their meat. At corn harvest some give piecework, some give the men all their meat.

148. [No mention was made at this meeting of the Oulton School, supported by Sir P. de M. Grey Egerton, M.P.

The following modification of the half-time system was carried on at Oulton Park:—

Eight boys are employed in the summer in the gardens, each of whom is required to spend half his day at school; this is in the morning or afternoon in alternate weeks. They are paid for the half day, and earn 1*s.* 6*d.* a week. It was adopted in consequence of the withdrawal of boys from school at 11 or 12 years of age, and the result has been that the parents are glad to keep them there under the half-time system up to 14. A great deal seems to have depended on the willingness of the bailiff to co-operate thoroughly in the experiment; they are all now, however, under the gardener, with the exception of one in the stables.

Sir P. G. Egerton, however, says, "my school is "too small to supply more boys than I employ "myself." So that any extension of the system to the farmers would be difficult.

These boys are not found to be in attainments much behind boys attending school all their time. The schoolmaster at Oulton, however, (who was new to the work,) told me that they required special attention on his part, though he put them into classes with the other boys. They did not show any disposition, with one exception, to work privately in order to keep up with the rest.

In this excellent school the following form of complaint was sent to any parents not sending their children to the school regularly:—

"Your child, ———, has been absent from school "——— without leave, please write below the reason "of ——— absence, and return this paper by the "bearer."

This was found to have a good effect in promoting regularity. I found a similar system prevailing in one of the Shropshire schools.

The Oulton school provides education for a very wide district. Three children come with the average regularity from a distance of 2½ miles to school, one of them having began to do so at 3 years of age; another girl came three miles to the school.—E. S.]

149. In the course of a walk through the parishes of Rushton and Eaton, I gathered the following evidence from the labouring class:—

(*a.*) Wife of a labourer.—Worked on the neighbouring farm whenever wanted. Went with the men; was the only woman employed. Went to potato setting and picking, and to corn harvest and a little weeding. Gets 16*d.* a day. Goes to threshing machines, but never works on the stage, only on the stack. Would not like to work on the stage. Works from 7 a.m. to 6 p.m.

(*b.*) General labourer.—Gets 12*s.* a week all the year. Has worked many years for the same master. Loses very little time in winter. Gets no extra money at corn harvest, but his food is given him.

(*c.*) Horseman, many years with same master.—Goes 1½ miles to work every day. Often starts at 4.30 a.m., and does not come back till 7 or 8 p.m.; in harvest would be later. Killed no pig at Christmas. Has one now. Gets 11*s.* a week and all his meat. This is more than other men would get, but thinks master gives it him because of the distance he has to go, and the good example of work he sets the others.

(*d.*) General labourer.—Goes 1½ miles every day to work. Gets 12*s.* a week. Loses a good deal of time in winter. Sometimes he is put to look after the cows, and then he has his breakfast given him, and on Sunday his dinner also. If he milks he gets his supper. Has 10 or 12 rod of potato ground on the farm, if he likes, for nothing. Has two pigs and a large garden full of damson trees. Any produce readily bought by travelling hucksters from Manchester, &c.

(*e.*) Horseman.—12*s.* a week. No extras. No piecework, but food given for a month at corn harvest.

[Some farmers appeared to give 11*s.*, others 12*s.*, to ordinary men. Instead of piecework, food given to the men during two months of the year. Others give "baggings" only, that is, bread and cheese at 11 and 4, and three pints of beer. Mr. Lea "lets out potato "land to his men at a moderate rate." Some few give the land for nothing. The Irish are paid 1*s.* less, and lodge on the farm buildings, or go backwards and forwards to the Tarporley lodging-houses.—E. S.]

WYBUNBURY.

Population - 4,985; acreage - 15,572.

Contains 19 hamlets, but three form a separate cure at Weston, and four at Doddington.

150. Notes of Meeting, January 20, 1869.

PRESENT:

Rev. R. Turnbull, vicar.
Mr. Thomas, } Churchwardens.
Mr. Darlington, }
Rev. J. Foliott, landowner and magistrate.
Rev. V. G. Yonge, vicar of Doddington.
Mr. Speakman, agent to Sir H. Broughton, Bart.
Mr. Salisbury, }
Mr. Parton, guardian, }
Mr. Cooper, }
Mr. Madders, }
Mr. Ellson, } Farmers.
Mr. Edwards, guardian, }
Mr. Birchall, }
Mr. Lunt, }
Dr. Bellyse, }

Two-thirds of the cultivated land is in pasture. Women are never employed, except in harvest, and even then only occasionally. Some of the wives of the ordinary labourers, two or three perhaps in a township, go to milk morning and evening. For this they are paid 2*s.* a week. Some boys are hired into the farmhouses at 12 and 13 years of age, more generally not before 14, or even later. Before this age boys are occasionally employed to mind birds. The potatoes where they are grown are mostly picked up by the Irish. The neighbourhood of Crewe causes a considerable variety of labour, and so Irish are more employed than formerly. It has also raised the wages 25 per cent. It was represented that men employed regularly at 12*s.* a week in winter, would work for 15*s.* in summer. But at piecework a great deal more is earned. Food is given in addition; in some cases, instead of piecework, all their meat is given to the labourers. But the extra hands employed in harvest

Cheshire.
Mr. Stanhope.
g.

will not work except by the piece. Very few, except single men or waggoners, will get their meat with a reduced rate of wages. Some few boys are stated to be three miles from any school (except a dame's school); many are two miles. There are nearly 2,000 people in the parish who are three miles from their parish church.

Mr. Turnbull thought that one in nine of the population (approximately) are attending some school. It was generally admitted that there were a great number of children in all the townships not sent to school who ought to be, mainly owing to the indifference of the parents, but in some cases also to the distance from any school; it was doubtful also whether there was enough school accommodation in the parish for the children who might attend.

It was agreed that restrictions upon field labour up to 13 years of age would make no difference to employers, but that to deprive the parents of the earnings which younger boys can make during a few weeks employment would be seriously felt by them, and would be a hardship in particular cases. It was stated to be the exception where men willing to take agricultural work had to walk any distance to work, but that from the anxiety to work at Crewe, they will some of them walk long distances there.

There would not be quite an average of two female domestic servants in each farm. They would not average above 12 months in a place. Character is very rarely inquired for, but many are very glad to get them with or without it, owing to the scarcity. Some of the farmers present required their servants to be in by 9 o'clock, one gentleman locking them in; but as a general rule, the door is left so as they can go in or out. In some cases a stipulation is made on their engagement that they may have a night out. Sometimes the parents will ask the employers to require them to be in in good time.

AUDLEM.

Population - 2,870; acreage - 11,571.
(Including five townships.)

151. Notes of Meeting, January 19, 1869.

PRESENT:

Rev. A. Atkinson, vicar.
Mr. Boote, Hankelow.
Mr. Blakeman, clerk.
Mr. Nunnerley, Buerton, } Farmers.
Mr. Gouldborme, Dodcott, }

Two-thirds of this parish is pasture land. Women are rarely employed, except to help their husbands at harvest. A few are put to all sorts of work at Combermere, but this would be chiefly in the summer. Even at haymaking few women are employed. They are employed at milking, and would in such cases be the wives of the regular labourers; for this they would earn a dish of butter per week. Some prefer the money, which would amount to 1*s.* 6*d.* or 2*s.* per week.

On an average there would be at least two female servants in every farm house, the large ones have three or four; about one servant to every 10 would be the rule. They begin to be hired at 12 or 14 years of age. Characters are not in the majority of cases inquired for. Some improvement is thought necessary in this respect. Cases were mentioned where girls go away from farm service for a few weeks to be confined, and are taken back afterwards, and not discharged.

Boys are hired from 12 or 13 years of age; they are employed younger occasionally in bird-scaring, potato-picking, especially in the case of large families. It was stated that the very slightest excuse was taken advantage of by the parents to neglect sending their children to school; that absence on Monday morning sometimes led to it during the rest of the week. The most common excuse is to mind the baby. There is an infant school at Burley Dam, in this parish; and small dames' schools for infants at two of the other townships, so that few children would be more than a mile and a half from any school.

Attendance at a school, if required, up to 12 years of age would have very little effect in this parish; it might be an interference with farm work, in some cases, to impose restrictions up to 13. Mr. Boote, who is a manufacturer under the Factory Acts, thinks that 12 would be a sufficient limit in field work. There is a night school, not well attended, owing in part to the distance which they have to come.

There was a strong feeling expressed that there were cases in which nothing but some sort of compulsion would get the children to school. Mr. Atkinson did not think that the payment of the school fees would afford much difficulty, though most of the other gentlemen present differed upon this point.

The wages of ordinary able-bodied labourers in this parish are 12*s.*, falling in winter (sometimes only) to 11*s.* If a man gets all his meat in the house, his wages would generally be 6*s.* or 7*s.* In harvest time they are generally given piecework, and paid in money. Some few farmers cut by day work and give meat.

152. [In answer to my inquiry as to the half-time system, carried on by Lord Egerton or Tatton, at Rostherne, his lordship kindly wrote to me, on February 17, a letter, of which the following is an extract.]

"I arranged the system some 15 years ago, in hopes of keeping the good boys longer at school, and as an encouragement to them and their parents. The boys like it themselves, and the parents do not object, as the boys are paid for the week's work, 3*s.* the first year, and 4*s.* subsequently; they are under a steady labourer, and are employed in every species of farm labour, attending to cattle, horses, &c.; but as I before explained hardly any remain in the situation of labourers, but go to Manchester to better themselves or become mechanics. I have requested our clergyman to inquire respecting those who have been half-timers for the last few years, and enclose his answer, which has caused some delay in my answering your letter. I do not think farmers will ever adopt the plan, both on account of the expense, and the difficulty of the necessary arrangements for two sets of boys."

ENCLOSURE.

153. Extract of Letter from Rev. A. R. Ducane.

1. They are employed on your estate in farm work from 12 to 15 years of age.

2. They are selected from those boys who are steadiest, and most forward in school work.

3. One set (half the number) work in the morning one week, the other set in the afternoon, changing with each other the next week.

4. Under the Government rules, the attendance of the half-time boys is only reckoned now as one attendance per day. Formerly their attendance at work was reckoned as an attendance at school, and being so marked in the school register, the average attendance of the whole school was much raised. Part of the grant depending on the average, it is a good deal diminished by this new arrangement.

5. During the clear years that I have been here (1863–8), 25 boys have gone through the half-time course. Of these the following is an account:—

1 draper.
2 gardeners.
1 wheelwright.
2 carpenters.
1 tailor.
1 is dead.
5 in vaults in Manchester.
3 in warehouses do.
5 in farm service (*not* for Lord Egerton).
1 works for Mr. Egerton.
1 in Tatton gardens.
1 in Tatton carpenters' yard.
1 with Tatton plumber and glazier.

25

6. The fact of so many leaving the parish as soon as they go to work has made it useless to hold a night-school, which I tried without success for two or three years.

I think the scheme would answer well for a parish a little further removed from a large manufacturing town. There is so much temptation to take them away from here, especially in the shape of the spirit vaults, which offer very high wages to those who have no ambition to raise themselves in any way. To those, on the other hand, who do care to rise, the warehouses with their steady promotions are open. But otherwise, and in fact as things are, the scheme does good, as the boys get into their work more gradually, and are kept longer under higher influences. All included in the above list are doing well and are steady.

154. Letter from G. W. Latham, Esq., Bradwall Hall, Sandbach, dated Feb. 10, 1869.

I have been thinking over the several points involved in our conversation at Crewe the other day, and give you my conclusions on them. First, the amount of instruction given at the Bradwall school will average about 700 hours a year; the big boys considerably less, the little boys rather more. I find as long as that is given regularly boys will progress as fast as they do in a National school. When, however, it becomes intermittent, as in the case of a horse-boy, or a cow-boy, who has no opportunity of learning in a class, but must take odd times to learn, I find it is not satisfactory, but, I fancy, it is rather that the irregularity gives an excuse for idleness than anything absolutely prohibitive in the quantity. Applying this to general instruction I come to the conclusion that if we were to enact that before employment in 1869 a boy should produce a certificate he had attended school for 400 hours before 10 years of age, in 1868, and for 200 hours in each year between 10–14, we should ensure some amount of knowledge. If he choose he might instead of a certificate submit to an examination by the nearest National and certificated master, a certain grade being fixed for each age.

2nd. As to the payment of wages partly in food, I find on enquiry there are two classes of labourers with whom this is done. One, carters to farmers, who are also brick makers, hay dealers, or market gardeners, and who thereby have very irregular hours of coming home; and the other men who are getting worn out, in which case the food is given as a sort of relief to the employer. I take it, that in the first case the food, being prepared often specially, costs more than the wages to the employer; in the latter it costs less, as the man does not care to grumble at it, and knows if he leaves he will find a difficulty in getting employment.

3rd. As to our present systems of hiring. You know that, as a rule, certain servants in Cheshire, carters, cow-men, boys, dairy-maids, and vessel-cleaners, are hired by the year of 51 weeks, the Christmas week being a holiday. Those hired are generally the unmarried men who live in the farm-houses. The arguments in favour of the system are first on the side of the employers, who assert that all servants would leave as cheesemaking and harvest time approached and better wages will be got; secondly, on the side of the servants, whose advocates say, their employers would dismiss them in October, after cheesemaking and harvest were finished. Of course the result of a general termination of hiring at a stated time is that little if any enquiry into character is made, no reason for leaving is asked, and that, practically, a woman without a character is taken as readily as another, the only point ever asked being, in the superior class of women servants, Can she make cheese? As for men and boys, I believe, no question is ever asked if they look likely. The evil of this system strikes me to be enormous. In the first place, it is a bond for a year between two persons whose tempers may be most incompatible, and as such becomes servitude for the time. In the second place, there is no incentive to any well-doing; character becomes valueless, and as long as the year can be scraped through somehow, master does not care to attach servant to him, nor servant to please his master. Again, the annual holiday is a source of enormous moral evil. Not only are the cottages crammed when half a dozen sons and daughters come home all at once, but in every town there are dancing parties on every evening during the time, and fairs are held nominally for the purpose of selling clothes to the servants who have got their wages, but practically for drinking and flirting. I believe that I may say that in two cases out of three of bastardy which I hear the corroborative evidence will speak of the complainant sitting on the respondent's knee in a dancing room at Christmas, or to his having followed her home at Christmas when she left the place. The year's hiring too prevents a master giving any warning to his servant. He cannot say, If you do not take more pains; if you are out in the evening; if you come home drunk, I will dismiss you. As long as a case for the interference of the magistrates does not exist the two must go on for the year. As to the arguments on the other side, my answer is that, granted the number of farmers and of necessary labourers is now in proportion, there would always be servants to be hired, and, on the other hand, of employment to be got. Employers would soon find out that to keep a good servant they must play no tricks of dismissal in October; and labourers would find that no one would hire a servant who has left his or her place at a critical time. At the very worst I can only imagine the creation of a class of clever and unscrupulous servants who would trust to their talent to pick up odd jobs. In all employments there must be times of extra work and diminished work, and I do not see why the relation between farmer and labourer should be different than between squire and butler, or tradesman and shopman. I take it that the demand for a character will arise if a new system were started, for there would never be a general change, and, therefore, reasons for the changes might be asked and verified.

I am after all disposed to believe that to promote the education of the labourer we must look more to the improvement of the middle-class schools than to any legislation. I hope to see a scheme by which the funds of such schools, instead of being given in the shape of salaries, will be allotted to scholarships gained in a competitive examination of pupils in the National schools. Thus the poor man's child would have a chance of rising if he showed talent and industry, and it would be a great encouragement to sacrifice a child's profitable labour if a parent could hope to see him rising in the world. At present, I take it, the best scholar in a country National School is as hopeless of rising above his class as the worst. Nor would this be the only gain from middle-class education being improved; I am disposed to believe that of all classes the middle classes are the worst educated; they have been instructed in certain elements of knowledge, but in such a way as to lay no foundation for any self-improvement on their part. If the master rises the labourer must rise also.

155. Lee P. Townshend, Esq., Chairman of the Quarter Sessions and the Northwich Board of Guardians.

The farms in general in this district are small, and would certainly not average anything like 100 acres. The occupiers are therefore little raised above the rank of day labourers. Meat is not habitually eaten by them, but the cheese which they make themselves forms their chief diet. The usual rule in my neighbourhood is that the labourers board at the same table with their masters, who pay them in addition 7*s.* or 8*s.* in money. This is cheaper for the master, but I doubt if it is better for the labourer's family.

The families of these farmers work themselves at the cheesemaking, and many of them in consequence employ very little hired labour regularly. They trust for occasional labour to the great number of Irish living in the towns, such as Knutsford and

Cheshire.

Mr. Stanhope.

g.

Northwich. Some of the Irish, however, work all the year upon a farm, and lodge in the buildings. A room for Irishmen is now sometimes added to a farm-house.

We are surrounded by the manufacturing districts, and we cultivate a large number of early potatoes for sale there. The labour connected with this crop, the setting and the taking up is mainly done by these Irish and their families, working from the large towns and going backwards and forwards. Sometimes they are employed by the occupier, in other cases the crop is sold on the ground, and the buyer hires the Irish to take it up.

With this exception, we have no women or children employed in agriculture.

156. [For the following notes on the food, &c. of the labouring class I am indebted to a lady who has paid great attention to the subject.]

Most of the farmers have meat and potatoes for dinner daily; potatoes and bacon for supper. A large quantity of potatoes are boiled for dinner, and those left are cut up into slices, fried, and put for supper into a large dish of bacon.

In some of the smaller farmhouses the girls have their dinner after the master and mistress; in all others the farm girls and lads sit in the same kitchen with their master and mistress, but at a long dresser table at the side for their meals. For breakfast they have hot whey poured into a basin of bread, as much cheese as they like, and "stand-up pies" of fruit. For supper, potatoes, bacon, and cheese.

Hardly any labourers eat meat at home, though some few can afford a little occasionally on Sunday. Potatoes with butter-milk, if they can get it, is the ordinary food. Sometimes a little bacon as a luxury; when a labourer's wife takes his dinner to him, it is then either hot potatoes in a covered basin, or else gruel thickened with a little treacle or sugar.

157. Richard Dutton, Esq., Stanthorn Hall, vice-chairman of Northwich Board of Guardians, farms 176 acres.

Girls are rarely employed in the fields, though in the neighbourhood of Middlewich a good many young boys and girls are taken to frighten birds off the gardens. A great many women go to work in these gardens. Such women as do work on the farms are mainly Irish, who help in setting and getting up potatoes, and sometimes, though rarely, in threshing. Boys begin to work about 10 or 11 years of age, though they will watch birds and do occasional work earlier.

In the Northwich Union we pay for the schooling of children of parents receiving out-door relief under Denison's Act, and try to put pressure on the parents to send them. Many, however, are completely indifferent. The money is paid to the schoolmaster when he produces his bill. I find a great number of boys who are not educated at all. A good many come into my employment who cannot read to any useful extent; the parents, however, often send them to the Sunday school. I have two men who can't read or write; they have been brought up within a mile of a school.

Almost all our able-bodied men are attracted away by the higher wages of the salt works, and we are reduced to the old men and the Irish.

I pay 12*s.* in summer, and 11*s.* in winter. They lose no wet days, and other farmers, who deduct lost time, pay 11*s.* all the year. Some give, however, 8*s.* and their food, or 10*s.* and their dinner. I give no food. The Irish get the same wages, and they drink very large quantities of buttermilk.

Piecework at harvest chiefly; machinery has diminished this very much. We should then give beer. Wages are paid monthly, or sometimes fortnightly. I should like to do away with the beer system altogether, as some have done, but I find it very difficult, because the men do not like the idea. You will find the amount of money payment varies in almost every farm house, according to the character of the establishment, and the amount of work expected. Some send their men to milk before and after their ordinary day's work.

Female servants are not hired at statute fairs as they used to be. The morality and tone is very low indeed. This is partly owing to the bad arrangement of sleeping accommodation in most farm houses, still more to the state of the cottages. Few have more than two bedrooms, and the parents have no objection to letting a married man or a daughter continue to live at home. The cottage accommodation is decidedly insufficient, and but few are being built in the purely agricultural townships. For this reason farmers employ a great many Irish, who do not mind where they sleep.

158. *Samuel Beckett, Esq.*, agent to the Marquis of Westminster, Eccleston, Chester.

In this neighbourhood the farms vary in size from 50 to 400 acres. The latter, however, would be considered a large-sized farm. A farm on which 70 cows are kept would require probably 8 or 10 milkers, of whom four would be women, *i.e.*, indoor servants.

Dairymaids, and indeed all sorts of in-door labour, are very scarce indeed. It was for this reason that "cheese factories" were suggested, where farmers could send their produce to be made into cheeses, but they have not hitherto been established.

Lads from 15 to 25 are hired in the same way, and would get at first 3*l.* or 4*l.* a year, beside their board and lodging.

Very few, if any, boys are employed under 13 years of age. I hardly know an instance on Lord Westminster's estate. They are then taken for "driving plough" and other light work, and work regularly. Up to that age there is no reason why boys and girls should not go to school regularly.

Lord Westminster has built a very large number of cottages, and on this account is able to command a sufficient supply of labour for himself and his tenants. He charges, as a rule, 3*l.* 10*s.* to 4*l.*, including about one-eighth of an acre of garden. We find larger gardens occupy too much of a man's time. The cottages are never let with the farms. In accepting a cottage tenant I should say, "Your cottage adjoins "Mr. ——'s farm; you ought to work for him, and if "you cannot agree with him, and are to blame, you "will have to leave it." They are let on a quarterly agreement, determinable at a month's notice. A tenant would also be allowed in some cases to nominate the occupiers of the cottages adjoining his farm.

On this estate labourers are encouraged to keep a cow. In every township we have a "ley" field for them to pasture their cows on in summer, and another for them to cut hay from. For these advantages they would pay 5*l.* a year, which many of them are ready to do. In only two townships are any allotments let.

159. At Chester, on Dec. 5, 1868, the following practical farmers,

Mr. Thomas Finchitt, of Rushton;
Mr. Thomas Parker, of Aldford;
Mr. John Jones, of Daddleston;
Mr. Joseph Aston, of Brassey Green;

met by appointment at the Grosvenor Hotel to confer with the Hon. E. Stanhope, Assistant Commissioner.

It was agreed as follows:—

On the average from two-thirds to three-fourths of the land is in pasture, in spite of the increase of arable land owing to the cattle plague. Boys are not regularly employed (in the parishes with which these gentlemen are connected) before 12 or 13 years of age. Before that they might do a little bird-minding or horse-leading for a few weeks in the year.

There would, therefore, be no objection on the part of the employers to boys being kept at school till 12 years of age. In some places there are allotments, which the lads assist in cultivating; or there may be exceptional cases, in which to fix 13 as the age might be a hardship.

Girls are never employed in the fields. Women only on some farms. Mr. Jones and Mr. Finchitt say

some are employed to weed, spud thistles, &c. A good many help in milking, for which they get about 2*s.* a week; but they are less willing to come than formerly. Girls enter domestic service at 13 years, but are not employed at cheese-making before 17 or 18.

The money wages are 12*s.* Mr. Jones (who is near iron works) thinks that "piecework and privileges" would add from 1*s.* 6*d.* to 2*s.* a week all the year. The others would not fix it nearly so high, as there is less piecework in this grass country; 1*l.* is sometimes given in lieu of piecework at harvest. Potato ground (about 10 or 12 rods)is sometimes given, sometimes let to regular labourers. Mr. F. gives as much as they want, and takes half the produce.

Gardens general, from 8 to 15 rods; they all have fruit trees in them. In Mr. Aston's neighbourhood the cottages are very bad, rarely with more than one bedroom. So says Mr. Finchitt. Mr. Parker has 31 or 40 cottages, none with less than two bedrooms. Mr. Jones lives on Lord Westminster's estate, where they are, with few exceptions, very good indeed.

160. [To these notes Mr. James Pickering, of Whitby, adds—

A farm of 300 acres would require from 10 to 12 milkers in summer. Of these three or more might be women, wives of the labourers. There would be 70 to 80 cows. These women would get 1*s.* to 2*s.* a week, besides some buttermilk, curds and whey, &c.

Almost all the labourers have fruit trees in their gardens. I have known 20*l.* cleared by this in one case, and often as much as 10*l.*

In Whitby few labourers keep a cow; my carter has two. They may all keep pigs.

We employ a great many Irish, some of whom stop all the winter, lodging in the out-buildings. They get 10*s.* to 11*s.* a week, and are allowed buttermilk.

I never employ a woman on the farm in out-door work.

Mr. Ralphs, of Saighton, adds, that two of his labourers keep cows; they all might do so.—E.S.]

161. The following extract from a letter from Mr. T. Rigby, of Over, Secretary to the Chamber of Agriculture, appeared in the "Crewe Guardian," dated February 11, 1869:—

"How far it was a good plan to pay wages partly "in food?" was the question which escaped being definitely answered, and taken in connexion with Mr. Stanhope's remarks on cottages must be regarded as referring to labourers receiving weekly wages and not to hired servants. Two things may have conduced to this mode of payment: the distance at which the labourer may live from his work, and the easier, and perhaps cheaper, mode of payment to the employer. But it can never be a good thing to separate the husband and father from his family at meal times in a moral light; to do so must tend to destroy union of effort on the part of man and wife to provide for the wants of their family, and deprive the children of the cottage to a large extent of paternal love and admonition. Nature has given more power of authority over children to man than woman, and those who know the character and natural tendencies of children to disobedience and ofttimes to defiance of the mother's commands, must know that it is ever to their injury to be deprived of the admonitory and even despotic word or order of the father. Much of the obstinacy of some servants, lads especially, arises from this deprivation in their early life. The arrangement, too, strikes a hard blow at the filial affection and love which is desired in all our homes. Instead of being the husband—or house-band, as the word implies,—uniting all in one common desire for the welfare and happiness of each other, he is little more than a lodger in his own cottage, and rarely sees his children except on Sunday and for a short time in the evening on his return from work. These results must be objectionable, and it would be better, therefore, to place the labourer in such a situation that he could be the centre and head of his own domestic circle. On the question of expense the idea is constantly gaining ground that it is as economical, at least, and more satisfactory to pay full wages in money, and allow the labourer to provide his own board.

This remark leads into the other part of the question, relating to cottages, which, it is thought, conduces largely to a great social evil. Some plain and truthful remarks were made respecting the number of rooms which every cottage ought to contain, and may lead to some gradual improvement in this matter, but little was said of their being contiguous to the farm homestead, and yet it is most desirable they should be so situated, both in order to allow the labouring man to live with his family as much as possible, and to enable him to give his labour to his employer without the exhaustion and the detraction of strength that must attend a long walk to and from the farm and his cottage; and it is very desirable that they should be so situated to enable the farmer to compete with the manufacturer in securing and retaining good workmen in his employ. There is really very little difference between the pay of the farm labourer in Cheshire and that of the unskilled town labourer, such as carters and porters, when the difference of rent and living between town and country is considered; but there is more and better house accommodation generally obtained in the town, and it would be both for the landlords' and tenants' interest to have cottages on or very near every farm, in proportion to its size and situation, and in order to retain sufficient labour for its cultivation. Our best young men are driven into towns when they marry, for want of houses in the country, and farmers are left with a make-shift class, that, as a rule, are not good servants. Another matter which would have an important bearing upon the condition of the farm labourer would be to arrange that he should have a good-sized garden, where the soil is suitable, and from two to five acres of land, to enable him to keep a cow; an occupation of this size need not withdraw his time or attention from his own farm labour to any extent, as his wife and children would be able to manage the whole with such labour as he could give in the evenings, and a very few days at harvest time, while the industrial training with which it would furnish them would be of much value in their preparation for future duties.

162. Extract of letter from Mr. T. Cawley, agent to Mr. Tollemache, M.P., Priestland, near Tarporley, dated February 9, 1869.

In the parish of Bunbury Mr. Tollemache has allotted 87 half acres to the poor, in Acton 49, in Baddiley 12. In general they are well managed, and where the occupier is a farm labourer his master does his team work. He frequently gets an hour or two in an evening to plant potatoes, &c., and his family do the rest of the work required. The profits on these plots are large. The labourer has a quarter of an acre of wheat, giving straw for his pig, and quarter of an acre of potatoes, at a rent of 15*s.* to 1*l.* I never heard a farmer express his disapprobation of them. Near Peckforton a large field is appropriated for the grazing of 20 cottagers' cows from May till Christmas, with which the labourers are much pleased.

163. Extract from a letter received by me from a clergyman after one of the parish meetings (December 1868).

I had hoped for a few words with yourself before you left yesterday; for there were one or two *points* on which I know farmers to be very "*sore*" all over England, and if you had come out a "don," &c. one or more here yesterday were fully prepared to "give "you (as if 'Government') a bit of their minds;" one broad-backed fellow was to have been "leader."

* * * *

The point is this,—to write in the words of two of the farmers who mentioned it,—and you passed it:—

1. "*The Government is doing too much*" (*i.e.*, in education).
2. Another said, "All we want is *reading, writing,*

Cheshire.
Mr. Stanhope.
g.

" *and arithmetic,* and that's *equal* and fair *for* " *all trades, &c.*"

Now this was Mr. Lowe's dogma when he was Vice-President, and Lowe was *quite right.* " Strictly limit " to primary elementary education." If you go beyond " *the three R.'s* " then you *favour* some at the expense of others.

Now can't you quietly in your report bring forward this right principle for farmers all over your district, if not beyond,—*no favouritism by Government in educational taxes.*

You'll see the just ground of agriculturists if you will mature your judgments on this *simple fact.*

Farmers pay for and carry on *technical education* in their own trade.

We have not a child who does not go to school somewhere.

The Government school inspectors can't or won't understand that *agricultural is technical education.*

In our 1868 Government inspectors' report our school is reported adversely on account of the non-advancement of scholars in " *the higher subjects, &c.*" " My Lords " therefore threaten to reduce the grant if this be not rectified, as they think rectified.

I shan't quarrel with my farmer to please " my " Lords," because farmers agree with Mr. Lowe in holding that taxes—*Parliamentary alms*—ought not to be for more than the three R.'s, *i.e.*, quite primary scholarship.

The children " between 10 and 13 " have never missed attendance in school for book-work, except boys for *technical education* and girls industrial at home.

The farmer parents themselves educate them, the boys in agriculture, the girls in housework and nursing. The cottagers also. And in taxing for the higher subjects no doubt the Government is favouring *now agricultural trades,* commercial, &c., and drawing cottagers' children from agriculture in after life.

There is strong truth in what one farmer, speaking for all here, said, " No one ever makes a real farmer " or a real labourer who don't begin as a *little* " boy."

This is not enmity to popular education, as school inspectors interpret it. It is beginning " *technical* " education " in childhood; and if you were to examine my boys in geography, history, &c., &c. (" the higher branches ") you would " pluck " them; but see them use a pitchfork, bed up a cart-horse, drive up the cows, harness pony, &c., you'd give them a first prize.

164. The system of *hiring female farm servants* has been already alluded to.

(*a.*) *Rev. Chancellor Thurlow,* Malpas, says of them, " I formerly visited every farmhouse in the parish for the purpose of assisting the association to ameliorate their condition. Meetings were held, but they have led to no permanent result. The system of leaving the outer door open on Saturday nights was then almost universal, but now an improvement has taken place. Individual effort would not succeed in checking the practice, because small farmers are obliged to conform to what is almost a custom of the county."

(*b.*) *Mr. Brassey,* farmer, Malpas.—The worst thing you have to deal with is the hiring without character, and also that in nine out of ten farm houses, while the outer door is locked and bolted every other night, it is left open on Saturday night for any one to go out or come in. The reason is the difficulty of getting dairymaids without it, and I believe they will hire for less money where it is allowed.

(*c.*) At Wrenbury character is very little studied. Few farmers make any inquiry about it at all. In some cases the custom is, that one night in the week is given to them to do what they like. (Meeting, December 9, 1868.)

(*d.*) At Church Minshull no characters are asked for. The old " key system," which was very common 14 years ago, is now almost extinct. (Meeting January 15, 1869.)

(*e.*) At Acton " generally taken without character. " It is no hindrance to a woman getting a place if she " has had two or three illegitimate children. Two of " the gentlemen present lock up at 9 o'clock, but one " of them always leaves the key in the lock, because " otherwise they say it is like a prison." (Meeting, 1869.)

(*f.*) At Crewe Green some farmers require their servants to be at home at 9, some later. I have known them allow them to sleep in the buildings on Sunday night.

165. Extract from Mr. Temple's general report on Cheshire for 1867. (Report of Committee of Council on Education 1868, p. 261.)

The best schools that I have ever seen as an inspector are agricultural schools, where the " squire's " wife takes a strong interest in education, and where influence and authority are brought to bear upon the working classes for their own benefit.

I cannot close this report without expressing my strong sense of the public spirit and generosity which the landowners of Cheshire showed with regard to the support of the national schools with which they were connected during the ruinous losses caused by the cattle plague.

I expected to find half the schools in the agricultural parts of the country closed, but on the contrary every school has been kept open, and I doubt whether a single subscription has been withdrawn.

Domestic establishments have been reduced and houses shut up, but the school has throughout been supported, and its staff has remained unimpaired.

166. * [The notes of the remaining meetings I shall not reprint.

The following is a summary of the information given at them, and in answer to circulars, &c.—E. S.]

Women rarely employed except at harvest, and in some cases to assist in milking both morning and evening. For this they sometimes get 1*s.* 6*d.* a week, sometimes a dish of butter.

Girls are never employed in the fields, but from 11 to 12 they get hired as nurse-girls, and about 14 take to cheesemaking.

Boys in some parishes begin work as crow-keepers as young as 9, but *regular* work seldom begins before 12 or even 13. In one parish only it was said that boys after were absent four months in the year. When employed among the stock the hours of work are long, being from 6 a.m. to 8 p.m.

In several cases distance from school was mentioned as a difficulty. At Wrenbury some had three miles to go; at Acton some had three and a half, and a great many had two miles. At Malpas some had two. The

---

* [The remaining meetings which I held were at—

ACTON.

Population - 3,123; acreage - 15,542.

Present:—Rev. R. S. Redfern, vicar; Mr. W. Holding, clerk; Mr. Webb, schoolmaster; and Mr. Boffey and Mr. Furber, farmers.

BARTHOMLEY.

Population - 416; acreage - 1,982.

Rev. E. Duncombe, vicar; from Barthomley, Messrs. Jones, Thornhill, Remer, Wardell, Babbington, farmers; from Batterley, Messrs. J. Hollins, Hollins, Booth, and Glover, farmers.

BADDILEY.

Population - 272; acreage - 1,772.

Rev. J. W. Edwards, vicar; Mr. W. E. Hall, farmer.

WRENBURY.

Population - 2,505; acreage - 11,665.

Messrs. Thomas Nield and William Thelfa, farmers.

CHURCH MINSHULL.

Population - 392; acreage - 2,286.

Rev. J. Prosser, vicar, and Mr. Bolshaw, farmer.

MINSHULL VERNON.

Population - 402; acreage - 2,753.

Rev. M. Reid, vicar.]

great deficiency of infant schools was remarked on. Boys left generally betweed 11 and 12, or in three cases return between 10 and 11. Girls one year later.

Farmers manifested a good deal of hostility to advance in education. At Barthomley "part of the "scarcity of labour was considered due to over educa- "tion." At Baddiley "it is the general opinion in the "neighbourhood that the more education they have "the worse servants they make."

Sunday cheesemaking was remarked on at most meetings. In most cases it was thought necessary. At Acton it was the opinion that with additional buildings for storing milk the system might be changed.

167. Evidence as to the situation and condition of the cottages.

BARTHOMLEY.

Population - 3,002; acreage 11,035.

There are enough for the land. They are improving. Lord Crewe is building. There still remain some one-bedroomed ones out on lease for lives, which are improved as they fall in. Rents 4*l.* to 5*l.*, including about 10 perches of garden. (Notes of meeting, December 8, 1868.)

WRENBURY.

Population - 2,505; acreage 11,665.

Sad want of bedroom accommodation. They mostly belong to landowners. Almost all have gardens. Rents 4*l.* to 5*l.* (Meeting, December 9, 1868.)

DELAMERE.

Population - 1,146; acreage 8,770.

Rev. W. D. Fox. — The average cots have two bedrooms, one good one and one little offset. Some have only one, but it is generally large. In one house with two rooms, where a man with five children lives, he took in last year eight adult Irishmen. Scarcely any of the bedrooms have ceilings. The new cottages built by Government are very good, but are sometimes overcrowded.

TARPORLEY.

Population - 2,557; acreage 6,058.

Not in all cases well distributed, and it is very common for men to have to go one mile or one and a half miles to work. Instances of two miles are rare. At Utkinton there are some very bad cottages. Some have only one bedroom. With the exception of two new ones, there are none with more than two.

At Eaton there are also some very bad ones, but they are generally represented as better. At Tarporley there are a good many bad ones, but most of them have two bedrooms. Some are very bad at Brick Heath in Bunbury, of which parish Mr. Cawley says that they are in many cases very poor cots. The particular reason for this has been the letting plots of land on leases for lives, on which the occupiers have built cottages mainly of wood. But Mr. Tollemache has built some very good ones.

Gardens are very general, commonly a quarter acre in size. New cottages let at 5*l.* a year, the older ones at 2*l.* 10*s.* to 3*l.*

BUNBURY.

Rev. Wm. Lowe.—Every description both in shape and dimensions, from poor old cottages with one room, to new ones with three, exist here. Mr. Tollemache is building and improving. The drainage has been improved through inspection, but many houses still exist quite unfit for human habitation, in which fever has been rife. There are some miserable tenements in Cumberbach square, which have no back yard nor even a convenience for discharging the slops, &c., except through the front door. Rents from 2*l.* 10*s.* to (with three acres of land) 12*l.*

CHURCH MINSHULL.

Population - 392; acreage - 2,286.

Meeting, January 15, 1869.—Improving, for which there is great room. Many have one bedroom, and contain large families. Most belong to the landowners.

Rents 4*l.* to 5*l.*, including a garden, which most of them have.

Four acres of allotments, on which corn is allowed. The tendency of this is to make the land pass out of the hands of the poorest class.

MINSHULL VERNON.

Population - 402; acreage - 2,753.

Rev. M. Reid.—Enough. All have been made good by Mr. Lloyd and Mr. France. Most have three bedrooms. All have gardens, often a quarter of an acre. Rents, 4*l.* Some have land for a cow.

AUDLEM.

Population - 2,870.

There are too many cottages in the parish. In Combermere alone, where Lord Combermere is about to build some cottages, some few of the men would have to go a mile and a half or two miles to work. Cottages are not usually let with the farms. In Audlem itself, the cottages are good, some few only with one bedroom; there are some very bad ones at Cock's bank, mostly belonging to small owners. One gentleman present thought that one-third had one bedroom only.

In Buerton the cottages have mostly two bedrooms. In Hankelow they are better than in other parts of the parish, but very few have three bedrooms. In these townships few of them belong to the landowners. In Dodcott they chiefly belong to the landowners, but are scarcely sufficient for the labourers employed. Many of them were built with only one bedroom, which have since been divided into two. The sanitary arrangements are fair. Cottage rents (almost always including a good garden) from 3*l.* to 6*l.*; the average would be about 4*l.*

A piece of land is given for a cow; some have half an acre added, which they cultivate in corn and potatoes. Some of the gentlemen present think this amount of land an injury to a labourer, who has not sufficient time to cultivate it properly.

ACTON.

Population - 3,125.

Meeting, January 19. 1869.—In Acton township tolerable; none have one bedroom containing a family. There are very few here with more than two. They mostly belong to the landowner. In Burland and Brindley they are good, with the exception of (say) 10, which are dilapidated, and unfit for habitation.

In Cholmondestone, Worlestone, and Stoke fair. In Poole very bad. Many have one bedroom reached by a ladder. They were run up on the waste, but now belong to the landowners. It is an exception where there is no garden. Rents average, 4*l.*

WYBUNBUBY.

Population - 4,985.

Meeting, January 20, 1869.—Two-thirds of the parish belong to Sir H. Broughton, but only a smaller proportion of the cottages. In all the townships where they belong to him they are bad. It is doubtful whether they would average two bedrooms. They are generally half timber, and thatched, the intervals having been filled up with clay or brick. In Checkley, Chorlton, Hunsterson, Walkerton, and Blakenhall they are very bad. In Bridgmere many have been built on the waste, and the same remark applies. In Wybunbury township they are good. Some have one bedroom containing a family, but the greater number have been rebuilt, and have mostly two bedrooms. Hatherton is a divided property, and contains several very good new cottages, but the rest are bad.

Cheshire.
Mr. Stanhope.
g.

In Sharrington, where many Crewe artizans live, the majority are new, and have two bedrooms. In Stakeley they are fair, generally with two bedrooms. In Weston, Lord Crewe's cottages are very good. In Hough there are a good many indifferent cottages in a bad state of repair. Almost all have gardens, the older ones averaging from 20 to 40 perches. The average rent is 4*l.*; new cottages let higher.

There are seven allotments of one acre each.

MALPAS.

Population - 1,037.

Rev. Chancellor Thurlow.—The average have two bedrooms; it is uncommon to find any with one only. They mostly belong to the landowners and these are the best.

On the Cholmondeley estate they are very good and comfortable. They generally have three bedrooms. Some other landowners have built; on other estates no improvement is taking place. Rent, 4*l.* to 5*l.*

BURWARDSLEY.

Population - 500.

Rev. E. Titley.—Sufficient and not crowded. Generally two rooms. Average height, 10 ft. × 9 ft. Rents, 2*l.* to 6*l.*

Shropshire.

SHROPSHIRE.—EVIDENCE.

168. A meeting of the Shropshire Chamber of Agriculture was held at Shrewsbury, on Saturday, February 6th, to meet the Hon. E. Stanhope, assistant-commissioner. D. F. Atcherly, Esq. (vice-president) occupied the chair, and amongst others present were the Earl of Powis, J. R. Ormsby Gore, Esq., M.P., Gen. the Hon. Percy Herbert, M.P., Colonel Corbett, M.P., Baldwyn Leighton, Esq., R. Jasper More, Esq., Rev. W. Garnett Botfield, and a very large number of tenant farmers.

Mr. Stanhope in his remarks called especial attention to—

(1.) Education.
(2.) Cottages.
(3.) The employment of women in indoor and outdoor farm work.

(1.) The Rev. W. Garnett Botfield in opening the subject remarked, that at a previous meeting the chamber had agreed that a good sound education ought to be placed within the reach of every child. Now he wanted them to go a step further, and say that every child ought to be brought under it. In his view the remedy was not to be found in night schools or any half time system. But when there was a fair school in a district, he thought it would not be unreasonable to require every child to pass Standard IV. of the Revised Code, or in default to attend school 300 days in the year, up till 12 or 13 years of age; which he thought would be a good stimulus to the parents. He had fixed this impression mainly from his acquaintance with Cheshire.

The Rev. C. F. C. Pigott moved that it is desirable to discourage the continuous employment of boys in agriculture under the age of 12.

This being seconded, it was very favourably received; Mr. Davies thinking the employment of children no boon to the employer, though he was opposed to any legislative restrictions; and Colonel Corbett, M.P., after pointing out that the employment of young boys was very much less than formerly, observed there could be no objection to the resolution, but that it did not meet the case of girls, which was especially difficult, owing to their early withdrawal from school for farm service. Few boys were stated to be employed under 12, except for occasional work, of which it would be hard to deprive them altogether. The resolution was carried by an enormous majority.

It was moved by Lord Powis, seconded by Rev. W. G. Botfield, and carried unanimously, almost without discussion—

"That it is desirable that greater facilities be given "to schools in small rural parishes than are now "afforded by the Committee of Council on Education, in order to make the labour of youths more valu- "able."

(2.) On the subject of cottages, it was unanimously represented that great improvement was needed, both in respect of quality and quantity. Colonel Corbett and the Rev. W. G. Botfield pointed out the hard conditions imposed by Government in allowing money to be advanced for cottage buildings, the latter mentioning a case where he had built for 200*l.* a farm building which, under the Government requirements, was to cost 800*l.* The feeling was strong that such restriction made the privilege an useless one.

Opinions were unanimous as to cottages having three, or at least two, bedrooms, some farmers stating their preference for the latter number. One gentleman pointed out how in his parish the neglect of landlords in building had caused small speculators to run up cottages, in which they put only one bedroom, because they could get 5*l.* a year for them, and could not get more if they added better bedroom accommodation.

It was moved and seconded, amid loud cheers from some of the farmers present, "That there should be "three cottages to every 100 acres, and that they "should be under the control of the tenant."

Mr. Davis and others pointed out that as to the first part of the resolution, it depended on the character of the cultivation, and that on some farms one cottage to every 100 acres was sufficient.

On the question of letting cottages with the farms a strong opinion in favour of it was expressed by some of the farmers present, on the ground of the advantage it gives them in keeping their men at every season. Lord Powis and others, however, thought this a "one-"sided" arrangement, necessary perhaps for one or two of the more important servants, but not generally advantageous to a labourer, who (dependent to a great extent upon his garden) ought not to be turned out at a month's notice. He approved the nomination to the cottage being left to the tenant.

The resolution was not pressed.

Some discussion took place as to the amount of land to be let with a cottage, Mr. Bowen Jones, S. Minor, and others, deprecating (amidst loud cheers) too much land being so given. No one ought to have more than he could properly cultivate, which the speakers said could not be more than a quarter of an acre.

(3.) With respect to the employment of women, it was represented to be uncommon, except among the Irish women living in the towns. Opinions were expressed against any interference with such labour. Mr. Rainforth spoke strongly in favour of all sorts of employment for women, for which he said they were as well fitted as men. Mr. Davis, on the contrary, condemned "barn-work" for women, because of the danger caused by the chance of their dresses catching in the machinery, and also their being allowed to climb up and down ladders to stacks, &c. The state of morality among female farm servants was remarked on by Mr. Hassall, who admitted the great responsibility which rests upon farmers in this respect, and regretted that it was not more generally felt by them.

Mr. Stanhope having called attention to the part payment of wages in food and kind, Mr. J. Bowen Jones said that this was, to a greater or less extent, adopted throughout the county. In his part it exists only to a limited extent; and in spite of the prejudice of the labourers in its favour, he strongly advocated payment in money.

[For the above report I am myself responsible. —E. S.]

169. Extracts from Returns sent in to the Commission by Colonel Corbett, M.P. for South Shropshire.

I have no reason to think that the employment of women and girls, as far as it is carried out here, has any bad effects upon morals; and as there are cases in which they can earn money for their families, without neglecting their household duties (especially in the case of widows), I do not think it would be desirable to place a restraint upon their being employed, unless it were in the close proximity of machinery.

I am strongly of opinion that no such regulations about attendance at school as are laid down in the Factory Acts can be applied to the children of the agricultural labourers. Work is too irregular to admit of it. For instance, last autumn acorns were exceedingly plentiful, and keep for stock and pigs was scarce, consequently the children during some weeks at that time stayed away from school a good deal to earn money by picking acorns, for which they were paid by the measure.

I believe that the only legislative enactment which would be suitable to this subject would be to forbid boys being employed permanently under 12 years of age who could not read and write and do a little arithmetic.

As a rule, I do not like cottages to be let with the farms. They are very apt to be allowed to get out of repair, and at times lead to despotic proceedings on the part of the farmers towards their workmen, and a cottage can be kept for the use of a particular farm just as well when in the landlord's own hands. I have nearly all in my own hands, some being considered to belong to certain farms, if wanted, and I have no complaints from the farmers.

I think that extending the length of time for the repayment of a loan to build cottages might probably give some stimulus to their improvement, but it is not desirable to extend it over too long a period (say 30 years at the most), as it certainly ought to be repaid before there is a probability of the cottages needing repair. The real alteration wanted with regard to money lent by the Government and landowners is to do away with the hard and fast line which admits of little or no discretion; but makes it imperative to pull the building down and erect a new one, when in many cases for one-fourth of the expense the existing cottage may be made into a thoroughly good one by the application of a little common sense and practical knowledge. Each case should be decided on its own merits. If I had acted upon the principles laid down by Government, I should not have been able to improve one half the cottages that I have.

170. Extract from Return sent in by the Rev. R. K. Haslehurst, of West Felton, near Shrewsbury.

In the case of young children (from 4 to 6) distance from school completely *prevents* their attendance, and so they lose an opportunity which they can ill afford to lose. There is no class of children to whom the infant school is so important as those of the agricultural labourer, and for the simple reason that there is no class of children whose school life is so short. Hence the importance of bringing the infant school within the reach of the young children, or in other words, hence the importance in agricultural parishes of *multiplying infant schools*. What, for example, can be done for the education of a parish such as this, which, though containing only 1,067 inhabitants, is at least five miles long. For the elder children (*i.e.*, for those of 7 years old and upwards) the answer is easy. But what about the infants? How are they to be taught? If I am to have *only one* infant school I don't know where to put it. In fact, I can literally do nothing with only one, I want *at least three*. And yet there is only one school in this parish for boys, girls, and infants, all put together. I think the Education Board would do well to act more liberally for the encouragement of *infant* schools in agricultural districts.

LYDBURY, NORTH, and NORBURY.

Population - 1,437.

171. *Rev. C. Rolfe*, vicar. — About 20 of the mothers are engaged from time to time in field work, which often obliges a boy or girl to be away from school to look after the younger children. When they once take to it they seldom give it up, unless obliged by failing health, although they have three or four small children. They work in winter at turnip cutting or stone picking. At the latter work the younger members of the family can help. Young girls go to no other sort of field work.

Boys begin from 7 to 8 years old to "mind" birds, &c., and continue at this till 10 or 11, when they take to regular employment. They begin at 4*d.* a day, and are taken very young because older boys would have to be paid 6*d.* Thus eight months teaching (or nine at most) in the year is all that can be secured, and this decreases as the boy gets older, till he leaves altogether. I think it would be impossible to stop such work altogether, partly because of the necessities of the parents, and partly because of the pride the boys take in beginning to earn something. But some measure requiring all boys under 12 to attend school a reasonable time every year, so as not to interfere with such work, would be practicable, and would not be much felt by the parents, even if it had the effect of postponing regular employment for a year. The night school has been difficult to carry on, though the lads are willing to come, and the farmers inclined to let them. But the distance of many of them (two to four miles) and the short time left for the school work constitutes a great difficulty. The only way to meet this would be to pay some sufficiently competent person to go round and teach at the farmhouses throughout the winter. From half to two-thirds of the men belong to clubs.

It is the exception where they have any distance to go to work.

CLUN.

Population - 2,338.

172. Notes of Meeting January 26, 1869.

Present:

Mr. W. Beamond,
Mr. Hamar, Weston,
Mr. Hamar, Newcastle,
Mr. Statham, Clun,
} Farmers.

It was agreed that three-fourths of the cultivated land is in pasture.

Boys are not regularly employed before 13 years of age, as a rule, though some of the workmen's children are employed younger. Before that age boys will be a good deal employed in plough driving, bird-minding, pig-minding, &c.

All boys up to 12, or even 13, can attend school during three or four months of the year, so far as the employers are concerned.

Women are unwilling to go out, and consequently not many are employed. When a man is hired he is often asked whether or not his wife works out. A woman will earn from 9*d.* to 10*d.* a day, working from 8 to 6.

Waggoners have 11*s.* and a cottage. Ordinary men get 9*s.* or 10*s.* a week without a cottage. Each man has potato ground from half to two chains rent free. In grain harvest they have no piecework, but have all their meat found them for a month, or 1*l.* in money. At hay harvest they have a part of their meat given them. Some give waggoners all their meat in the house and 6*s.* in money.

Shropshire.
Mr. Stanhope.
g.

Turnip hoeing is generally set out to a stranger.

The married men are generally hired by the year at the fair in May; the ordinary labourer is hired sometime between Michaelmas and Lady-day, at which time he changes places.

Job men will go a long way to work, but, as a rule, the ordinary labourers have no very great distance to go.

It was agreed that there is great room for improvement in cottages, that some had one bedroom only, and that none, even of the new ones, had three bedrooms, except some erected by Lord Powis.

Very few men belong to benefit clubs here. Their confidence was shaken by the breaking down of a large club from bad management.

[The warden of Clun Hospital called my particular attention to the large sum earned annually by the families at "whinberry" picking. This in a good year lasts three or six weeks, and this year, an unusually good one, the sum paid for these berries by the buyers in the district was 800*l.*, and is generally 500*l.*—E. S.]

173. *Mr. Gwilliam*, farmer and bailiff to Lord Powis, Newcastle.—I have no boy nor woman now, and many fewer are employed than formerly. Perhaps, some farmers in hiring their men may make it a condition that the wives shall go out to work. Lord Powis' labourers get 11*s.* a week and regular employment, but no cottage or privileges. A farmer's labourer gets privileges, such has potato ground and a month's meat at harvest; some get a good deal of piecework, but on the other hand they lose time in winter. Some men get all their meat in the house, and a sum of money which the farmers often keep a secret. 6*s.* would perhaps be the amount. The ordinary hours of work are from 6 till 7, but it depends on the way the bargain is made with the master. It is better for the labourer and for the cottage if a landowner keeps his cottages in his own hands.

174. *Mr. H. Stewart*, schoolmaster, Clun.—Boys leave school altogether between 10 and 11 years of age. We complain more of this than we do of the irregularity of attendance; and yet out of 108 on the books the average attendance is only 50, and taking the class of boys about 10 years of age, the average absence will amount to 62 days, owing to field work. This is not at any one time, but distributed, and is hardly due to the distance some of the children have to come. The result of leaving so early is that they seldom get beyond the third standard. I should be satisfied if we could keep them even with the same irregularity up to 12 years of age. The real cause is indifference on the part of the parents; one-fifth of them are so careless that they either never send their children, or send them only for a fortnight at a time. I find from questioning the boys to-day that *all but one half of them belong to families living in cottages with one sleeping room.*

175. *Dr. Morris*, medical officer to Union, Clun.—Only 28 men belong to clubs here; they have no independence, and are not ashamed of getting relief. Six or seven years ago the People's Society, with a large number of members, broke down through the defalcation of an agent, and they have never had any more.

176. *Mr. Wolley*, farmer and guardian, Clungunford.—Women work a great deal here, and during the greater part of the year. The farms would average 200 or 300 acres, on each of which two or three women at least are employed. I have that number who are the wives of my regular labourers, and would earn, on an average, 2*s.* a week all the year. I make no condition with them as to coming, they are very willing to do so. The principal work in winter is turnip pulling and stone picking, and sometimes with threshing machines. At the latter work, and at fruit gathering, girls assist their mothers. A few girls go bird-minding, but we employ boys for the most part, as soon as they can run about, at 7 or 8 years old. I have one boy now at it; he is with me half the year for this work, and he might go to school the rest, but he does not. At 11 or 12 we take a boy regularly, but even then we could spare him part of his time. A boy would not be hired into a farm-house before 13. We have to go to the mop fair to get a boy or a girl.

I have two cottages on my farm let to me, each with two bedrooms; besides this I lodge four men and boys in my house, and hire extra men living in other cottages.

My regular men get 9*s.* and a cottage and garden, and beer or cider every day. I give them potato ground if they want it. Those I hire otherwise get 10*s.* a week, two quarts of beer or cider a day, or an unlimited quantity at harvest, with no other extras. Only one out of all my men belongs to a club.

STOKESAY.

Population - 559.

177. *Rev. J. G. La Touche*, vicar.—The school attendance here is pretty good, but when any difficulty occurs it chiefly arises from the poverty and ignorance of the parents. Formerly there was no good school in this neighbourhood, and most of the adults are unable to read and write. On the whole, however, they are anxious to get their children educated. There might be three or four families in the parish where poverty is the excuse for not sending them, but I don't think there is one where with proper management they could not do so. Those that stay from school appear to be idling and not to be employed in field work.

Women work occasionally here, and this affects the attendance of the girls. The chief work is the turnip pulling in winter, and weeding and stone collecting in summer. Boys also go to this a good deal, especially the latter. I see no objection in the work the women do to their being employed.

Occasionally young children under 10 are so employed, and are thus prevented from attending school. Boys leave between 11 and 12, though for a year or two before that they will have been at work occasionally.

This school was started 10 or 12 years ago. I regarded a high price for schooling as a good test of its being appreciated, and so I charge 2*s.* a quarter for the poorest children; the result is shown by the receipts of the school, which have gradually risen.

The quarterly payment secures a more regular attendance. They pay in advance, but the system must be worked with discretion, or it might have the effect of keeping them away. The charge keeps away some of the very poorest, but I doubt if they would come regularly if we charged nothing. I have sometimes tried the experiment of paying for them, or allowing them to come free of charge, but their attendance was so irregular that I have given it up. I am convinced they value the instruction more for having to pay something, be it ever so little, for it.

The cottages are mostly the property of the landowners, and, except Lord Craven's, are let with the farms. The system of letting cottages with the farms is in my opinion a very bad one, because it gives too great a power to the farmers, who allow the cottages to fall into sad disrepair. The cottagers generally speak with bitterness of the system, calling it slavery. There is a marked difference observable between the general condition of those under the farmer and those under the landlord, the former being more untidy. There are, I think, hardly any cottages with a single bedroom in the hands of small proprietors. In one cottage (and from the way I was told of it I believe it to be quite a common occurrence) the mother told me that her son, a young man of 20, sleeps with his little sister, a girl of nearly 12. "Indeed," said this woman, "we are in a sad state when the boys come "home at Christmas; they lie at top of one another."

BISHOP'S CASTLE.

Population - 2,083.

178. Notes of conversation with the Rev. W. M. Rowland, vicar, Thomas Griffiths, Esq., and Dr. Lemon.

The population of this town is composed chiefly of farm labourers, who, unable to find any cottages in the outlying townships, or in some of the neighbouring parishes, live here, and work in some cases at a considerable distance. Lydham, for instance (acreage 1,125), has no cottages available for farm labourers. So in the townships of Lea and Oakley, with an acreage of 1,700. There is only one cottage, and that a gamekeeper's. Many men go from one to two miles.

The houses in Bishop's Castle in which they are thus forced to live are deplorable. The majority have only one bedroom, and as some will keep their girls at home, in some cases grown-up boys and girls are sleeping in the same room. Mr. Griffiths says that it is not at all an uncommon thing for a bolster to be placed at each end of the bed, so that all the family sleep in it, with their feet towards the middle. On a recent occasion, the vicar going to baptise a child found five or six children in one bed with the mother, in which the father would also have to sleep.

The gardens are most inadequate; in some cases they have hardly any place to dry clothes in. In the hamlet of Colebatch gardens are attached. The rents vary from 4*l.* to 5*l.*; the windows do not always open. There is not a privy to every cottage.

Bastardy is stated to be unusually common in this neighbourhood. Mr. Scales, master of the workhouse, says that out of 38 women inmates, 27 are girls with bastard children, and out of 57 children 40 are illegitimate. The master considers the proportion twice as large as in any other union he knows of. The women always come to the workhouse with such children, and seem to have no shame in coming there several times. J. D. has just come in for the sixth time, and she has come in with every one of her children. The construction of the farm-houses is to a great extent to blame for this state of things.

In the vicar's opinion this state of the cottages is also an insuperable obstacle to a proper education. Dr. Lemon thinks "wages" to be the great difficulty. There is no independence in this place among the labouring class. A labourer who is ill one day, or whose child is sick, as a matter of course applies for the parish doctor, and a week's illness always sends him to the parish. Dr. Lemon believes union rating to have increased this tendency, because instead of having to claim relief before a parish meeting, a man goes now to the Board of Guardians, of whom one guardian only knows anything about him. Self-respect is a good deal impaired in this way.

Women do not work regularly, but a good deal of occasional work is done by them, especially just before harvest, because the privilege of "leasing" is made by the farmers dependent on their doing so.

The schoolmaster fixes 11 as the usual age for boys to leave him altogether; many, however, leave younger, even at 9.

[In the National school there were only about nine boys and eight girls, who were children of agricultural labourers. The oldest boy was 12, who had been at work.—E. S.]

179. *Mr. Lee*, bailiff to Lord Powis, Walcot.—I believe that the system of paying the labourer partly in money and partly in kind is on the whole, if in good hands, about the same advantage to the labourer as where he is paid wholly in money; but the objection to it is its liability to abuse, and that it places the man too much in his employer's hands. In many cases, at the time of hiring, the terms are fixed only in a very general way, and always verbally; so that although the labourer is hired by the year, the rate of wages paid him varies according to the price of corn or from other causes. A labourer, when so hired and living in his master's cottage, cannot even claim extra wages for extra hours of work; and if he gets extra food for it, it is from the charity of the employer. It is a great evil here that the hours of labour are not fixed as they are in most places, but men will work for the same pay, sometimes till 7 p.m. or later. Another great evil here is the system of giving beer or cider. The usual allowance every day is three quarts, but at harvest the quantity is unlimited on most farms, to encourage men to work. With the temptation thus thrown in his way, it requires a steady man to resist it.

Almost all the cottages have gardens, and good gardens, some as large as a quarter of an acre. I think that, considering the amount of time which a man can properly give to it, and the amount of manure he can provide, that two chains, or one-fifth of an acre, is as much ground as such men can properly cultivate.

180. Evidence of the labouring class from South Shropshire.

(*a.*) Waggoner's wife, Lydbury North.

Husband's wages, 10*s.* a week and his cottage rent free. This includes a garden, enough to set five bushels of potatoes in (about two and half chains). At grain harvest he gets his meat for a month (*i.e.*, all his food), but no extra money. At hay harvest he will have his dinner given him.

He has a piece of potato ground free on the farm, enough to set three bushels in.

Wife is "pressed" to go out at harvest time. She only goes then. Gets no money for it, but only some extra "leasing" (gleaning). This year she "leased" five bushels.

Husband goes to work often at 4 a.m., and don't leave off till 9. He will often come back to dinner; if not, he will come home at 6, and take some tea or what she can get for him.

They hardly ever taste butchers' meat. They killed a pig the other day. They try to make it last a year, as they sell some of it. Last year they were four months without any meat or bacon, because the pig had been a little one. They had nothing but potatoes and salt, bread and water to eat. Husband drinks water with his dinner; in very hot weather a little tea. At harvest he has some beer given him.

Wages paid every two or three weeks, when they like to go for them.

Has children at home; none working, but two attending school. Has only one bedroom.

[A very poor cottage. The next was as bad. The occupier earned 7*s.* 6*d.* a week and his dinner. His wife earned 10*d.* when she worked. Their rent was 4*l.* The earnings of the man may be taken as—

Wages - - -	10*s.*	per week.
Cottage (say) - - -	1*s.* 6*d.*	,,
Potato ground, 16*s.* - Value of dinner, &c., 20*s.*	say 9*d.*	,,
	12*s.* 3*d.*	,, E. S.]

(*b.*) Waggoner's wife, Clun.

Husband earns 10*s.*, and cottage rent free.

Cottage has two bedrooms, and contains two children of his, and two taken in to "nurse."

Potato ground free, to set three bushels (one and a half chains).

Garden only enough to set a peck in.

At harvest has a month of victuals given him, and some food at hay harvest.

Pigstye out of repair. Killed no pig at Christmas; will have to do without bacon this year.

Wages paid when they like.

They "scheme the money to pay the boot bill, one "pair at a time."

She did not quite get two bushels at "leasing" this year. On boy working at 4*d.* a day.

(*c.*) Labourer, Craven Arms.

Has 10*s.* a week and a cottage rent free. If he works on Sunday, gets 1*s.* more. Some of the farmers give 9*s.*, but Mr. ——— gives 10*s.*, because he won't allow pigs to be kept.

Hours of work, 6 to 6; some farmers work their men from 6 to 7.

Shropshire.

Mr. Stanhope.

g.

At harvest, 30*s.* extra; most farmers give meat for a month instead.

No potato ground, because he has half an acre of garden.

Wages paid every Saturday. Meat farmers pay every two or three weeks.

Would rather have a cottage of his own and pay for it.

[Cottage very small, tumble down, and with one bedroom. Belongs to Lord Craven.]

(*d.*) Labourer, Bishop's Castle.

Has 8*s.* a week.

Works for a farmer occupying 500 acres, but who has only one other regular labourer.

Rent, 1*s.* 6*d.*; cottage with one bedroom, about eight feet square. Garden, enough for half a bushel of potatoes. At harvest has meat for a month, and 10*s.*

Sometimes works till 7 p.m., and will have a supper or something for it by chance.

THE NEIGHBOURHOOD OF WEM, &c.

HODNET.

Population - 1,979 (contains 10 townships).

181. Notes of meeting with Rev. S. H. Macaulay, rector; A. C. H. Percy, Esq., landowner and magistrate; W. Minor, Esq., Chairman of Market Drayton Board of Guardians.

Women rarely work in the fields at all. Mr. Macaulay thinks 4 or 5 per cent. go., but only to contract work with their husbands. Even this has very much diminished of late. Girls never work.

Boys work regularly about 11 years of age, and before that go to plough-driving, and especially bird-minding at certain seasons of the year. They are hired into farm service at 11 or 12.

It was stated that there is considerable laxity in farmhouses as to the control of the female servants. Sometimes they are allowed to come in at any hour of the night. Female want of chastity is the chief evil here, but it does not by any means follow that such women make bad mothers of families.

WEM.

Population - 3,802.

182. Notes of meeting, February 3rd, 1869.

PRESENT:

Rev. J. Wright, curate.
S. B. Gwyn, Esq., M.D.
Mr. J. H. Barker, } Churchwardens.
Mr. Owen, landowner, }
Mr. King, farmer.

Women are employed on the farms round, but mainly in harvest work, topping and tailing turnips, or picking stones. They would not, as a rule, be employed on the whole three months in the year. Their wages would be 1*s.* a day.

The effect of field work upon the day school is not great. Boys are generally kept till 11 or 12 years of age, before which they are not much taken. The boys of paupers, however, are generally required by the guardians to find work at 9 or 10 years of age, and Denison's Act is not made use of in the parish. Girls leave more than a year younger to go into small places. Distance is a difficulty; a good many children have one-and-a-half miles to come, and so cannot begin till 6 or 7 years of age. There are few children not attending some school. Boys go to tend birds at 8 or 9, but would not regularly be employed before 12 years of age. Wages are 11*s.* a week, and in most cases beer every day. At harvest, instead of piecework, they generally get from 1*s.* to 1*s.* 6*d.* a week, besides all their meat and drink for a month, according to the work and the sort of man. Those men who are boarded in the farmhouse have 6*s.* a week in money.

MIDDLE.

Population - 1,280.

183. Notes, February 16, 1869.

A scattered parish; some of the children come two or three miles to school, though there is an auxiliary school, under a mistress, in one of the outlying hamlets. This makes a night school difficult to carry out. The Rev. Geo. H. Egerton, rector, finds that field work causes little irregularity, except for a week or two at the bird-minding seasons. On an average the boys leave altogether about 11 years of age for farm service. Girls stay later, special inducements being offered. Mr. Egerton attempted for some time a sort of half-time system, having a gang of six boys attending school half the day and doing task work upon the farms during the other half. It answered well, and the boys made scarcely any less progress at school; but the system fell through some years ago owing to the small demand for such labour, it having to be sought from the farmers, and to the difficulty of getting a fit person to superintend them.

Women are not much employed except at harvest time. Some few, especially Irish, work among the turnips at busy seasons. Mr. Groom (farmer) employs four or five of his labourers' wives for three or four months of the year in all. It is thought by the larger employers that boy labour could be dispensed with up to 12; Mr. Brewster (farmer) thinks till 13 years of age. Before that they are employed only a few weeks in the year, and are at those times useful.

To illustrate the different modes of employment, and of payment, I give the wages of five large employers in this parish. I speak only of ordinary labourers.

A. gives 11*s.* and two quarts of beer a day. Has, on 300 (?) acres, five indoor male servants and three men out. Pays overtime in food.

B. gives 10*s.* At turnip cutting seasons, &c. employs Irish men and women from Shrewsbury. One of them takes it and hires the others. They sleep in his buildings. Last year an Irishman with his wife and child slept two months there.

C. gives 13*s.* and no beer; objects strongly to giving it; nor will he ever pay in food for extra time. Employs on 300 to 400 acres nine men, who are able to get in his harvest. Employs no extra labour, except one or two of the wives at corn harvest. His harvest lasts about 10 days, when each man earns 5*s.* a day.

D. gives 12*s.* and a quart of beer a day, 9 or 10 roods of potato ground rent free, and piecework when he can.

E. gives 12*s.* and beer. Does not allow some of his men to keep a pig, but gives them bacon instead. —[E. S.]

LOPPINGTON.

Population - 515.

184. *Rev. J. W. Davis,* vicar.—As to boys the plan adopted here, by agreement between me and the landowners, is to encourage them to take to agricultural labour, whether permanently or not, as young as possible. It is found throughout the parish that the best paid labourers are the least educated, who can neither read nor write. It is not thought necessary, but on the contrary, a disadvantage that a servant on a farmhouse should be able to write a letter. Labourers' children ought therefore to begin work as soon as they can get it, and by this means it is hoped that the children of the smaller farmers will keep ahead of their labourers in respect of education. It is found, however, that 10 is the earliest age for continuous employment. The majority do not leave till between 11 and 12, before this, even at 8 years of age, they are taken away for occasional labour, and sometimes as much as six months in the year. Girls are seldom employed except sometimes at bird-minding.

PREES.

185. *Mr. George Houlding,* farmer and guardian. —The holdings in this parish vary from 2 or 3 to

100 acres. There is a fair proportion of corn land. Women very little employed here, and they don't care to go. I don't know any women employed here all the year round. Boys at 10 or 11 go to lead horses, tent birds, pick stones, &c. Up to 12 or 13 school is the best place for them, except just at the time when you want to tent birds. We give them their meat, and I give mine besides 1*s.* a week ; some do not. The wages of ordinary men are 12*s.* all the year round. If they get all their meat in the house they would have 6*s.* or 7*s.* in money. There are not many that pay their men in this way. Beer is given at some farms, but I don't see any difference in the wages where it is and is not. There is scarcely a cottager but keeps a pig, and some have land for a cow.

WHITCHURCH.

Population - 6,093.

186. *Rev. W. H. Egerton*, rector.—We have no difficulty here in keeping boys at school fairly up to 12; but after that age they go into farm service (which the scarcity of female domestic servants has made more common), where they have few opportunities of self-improvement, and often forget what they have learnt. Those who come the greatest distance to school are, as a rule, more regular and punctual than those who live near it. No half-time scheme would answer here, because the farmers rarely take a boy under 12, and would not engage one on such a system, nor do I think there is any necessity for it. [Between one-sixth and one-seventh of the population were on the books of a day school; more than one-eighth in average attendance.—E.S.]

There is a "rag fair" here every year, which is attended by the farm servants of both sexes, and has a very bad and demoralizing effect ; but the hiring is not done there, having been completed before that time. In the condition of the female farm servants there is great room for improvement. Written characters are rarely required. Some few farmers have tried to do so, but they say that they have found that they could place no reliance whatever on the characters given. The fault, however, lies to a great extent with the farmers themselves for neglecting their servants. I believe that an improvement has taken place, but even now a great deal too much laxity is allowed.

The maximum rate of wages is 12*s.* ; it is more commonly 10*s.* or 11*s.*, or if a man has all his meat in the house, 7*s.* Under this latter system the families are very badly off, though it is less common than it was. It is, in reality, making the man take part of his wages in food.

187. *Mr. W. Hassall*, occupier of 405 acres, and Member of Council of Central Chamber of Agriculture, Bubney, thinks "many children are neither at school or "at work, and I wish some scheme to be devised to "compel them to attend school, and to keep them "from *continuous* labour up to 13.

"Our system of hiring is very unsound, being "simply verbal, with 1*s.* earnest money, and frequently "without a character. The earnest money is often "returned without notice at the last moment, whereas "a brief legal agreement could be enforced.

"The seven cottages on my farm are held under "the landlord, at a month's notice. This I find acts "unfavourably, as good labourers generally object to "so short a notice and decline to take cottages under "it; those who do frequently leave their master "without a man at a very inconvenient time. The "landlord rarely exercises his power, and therefore, "as far as he is concerned, the notice becomes a "dead letter. For my own part I much prefer three "or six month's notice."

188. On Wednesday, Feb. 15th, 1869, I visited the Loton Park Estate in the neighbourhood of Alberbury, in company with Mr. Baldwyn Leighton.

The system pursued by Sir Baldwyn Leighton, Bart., has been to encourage saving to the greatest possible extent among the agricultural labourers. Towards this end a certain proportion of the cottages have several acres of land attached, sufficient to keep a cow upon, but these are never let to any man who cannot produce a savings bank book, and show that he has saved enough money to occupy this amount of land. The result of this has been great increase of providence among the labourers, almost all of whom have a savings bank book, and for every cottage with land attached which becomes vacant there are many applicants.

I visited many of the cottages. Every one had a clock, most of them had bacon hanging up, and the cottages presented for the most part a comfortable appearance. Those erected by Sir B. Leighton contain generally one sitting room below, with larder, &c. ; above are two bedrooms, one of them a passage room. The following specimens show the working of the system :—

(*a.*) Cowman.

Earns 11*s.* a week, including work on Sundays.

Has from five to six acres of land at a rent of 9*l.* 10*s.* Lost four cows in seven years. Has 10*l.* in the savings bank. Has brought up six children ; one at at school now (13). A grandchild (7) living with them does not go to school. Will go when she has a pair of boots.

(*b.*) Labourer.

Has all his meat in the farmhouse and 7*s.* in money. Was waggoner till last year, when he got the land, and gave it up. Would rather have all his wages in money. Has worked 8 years for the same master. Has six acres, one cow, and a heifer. Rent 10*l.*

Has been at home for work four weeks in all this year. As he gets his board, he does not generally reach home till 8 p.m. For two winters got 8 lbs. of butter per week. In summer generally gets 6 lbs. Sold it at 1*s.* a lb. Gets now (February) about 2 lbs.

(*c.*) Labourer.

Has 10*s.* a week, and at harvest all his meat and 2*s.* to 2*s.* 6*d.* a day. Has 10 to 11 acres, which he only got last year. Till then his wife was in domestic service. In their savings bank books I found that from 1859 to 1869, she had put by 89*l.*, and drawn out 34*l.* to stock the house and land. He had saved 51*l.* 14*s.* and drawn out 26*l.* 14*s.* They still had 90*l.* between them. Has to give up a month's work to manage his land, he thinks.

(*d.*) Labourer.

Wages 11*s.* and a little task work ; at harvest a month of meat and some extra money.

Has four and a quarter acres, including garden. Rent 8*l.* 10*s.* Gave up about three weeks last year of regular work. Has no pig.

(*e.*) Labourer in quarries.

Has eight acres, two cows, and a heifer. Rent 8*l.* 17*s.* 6*d.* It took nearly two months of his time last year to look after it. Has two pigs, one to sell.

(*f.*) Labourer.

10*s.* a week; loses no time ; no extras. Has seven children. Has five acres and one cow, now dry.

Has bread and potatoes for dinner, seldom bacon or cheese. A "strike" (bushel) of flour costs 8*s.* 6*d.* and lasts a week. No pig this year.

(*g.*) Labourer.

12*s.* a week. Has eight acres, two cows. Rent 11*l.* 5*s.* Loses about a month of regular work.

My visit convinced me of the prosperity of the cottagers, but Mr. Leighton was of opinion that the system required to be worked with caution to prevent unthrifty men from getting the land.

One objection occurred to me, that the grass land was in almost every case badly farmed, not being sufficiently manured.

The instances above quoted show that each cottager has to give up about a month of regular work to attend to his land and cow. Mr. Leighton doubted whether so much time was necessary, and was of opinion that it did not interfere with their fitness as agricultural labourers.

189. [As regards this system of allotments of two or three acres of land for a cow, it is objected to by many

Shropshire.
Mr. Stanhope.
g.

employers of labour here and elsewhere; in consequence of which Lord Hill is gradually discontinuing it on his estate.

Mr. Plymley, farmer, of Alberbury, says of Sir B. Leighton's cottagers "they are better off than many "of the small farmers, because the land is let to them "so low, they do not appear to me to care about "regular employment. I have employed a dozen of "them and have never liked them; if they know that "you are likely to have a particularly busy day, "they sometimes stay away. My neighbour, Mr. "Kempster, finds the same difficulty."

Mr. Crane, of the same parish, says "it interferes "very much with their efficiency, especially on the "stock farms, and also in hay harvest and other "times."

Mr. W. Minor, Chairman of the Market Drayton Board of Guardians, also thinks it a disadvantage to labourers, "as a matter of course they have a pro- "portionate quantity of land in tillage; the cows are "clandestinely turned out in the roads, and providing "for his cow by cutting grass round his master's "fields occupies the time which the labourer ought "to spend among his potatoes."

Mr. Houlding, of Prees, thinks "it makes a man a "bad labourer because at busy times he is looking "after himself instead of working for us."

On the other hand it was mentioned favourably to me by the Ven. Archdeacon Allen, and by Mr. Campbell, bailiff to Sir B. Leighton, Bart.

Mr. Timotheus Burd, land agent, Shrewsbury, says of it,—"There is some truth in the objection raised "by farmers that such occupiers are not so much to "be relied upon as regular labourers as those who "have a cottage and garden only; but these and "other objections sometimes raised do not in my "mind outweigh considerations in favour of a limited "adoption of the system.

"Where a labourer has the means of purchasing a "cow, and of renting land with his cottage to keep "her, obtaining it is a great benefit to his family, "particularly where he has many children; and it "seems to me that an agricultural labourer, who by "industry and prudence has saved money, should not "be shut out from improving his position; it is there- "fore desirable that there should be on all large "estates a certain proportion of cottages with land, "to afford opportunity of bettering the condition of "those labourers who deserve it; from three to five "acres is better than more."

190. NOTES of MEETING at Montford, February 5th, 1869.

PRESENT:

Mr. J. Bowen Jones,
Bowen, and Cureton, farmers.

This district is rather more arable than grass; women are little employed, though two or three of the workmen's wives sometimes do a little weeding, but a considerable number of Irish men and women come out from Shrewsbury to take up turnips and do other work. Sometimes one man takes the job and gets others to come; sometimes it is taken separately. The objection to it is the distance [6 miles] which they have to come to this parish.

Boys are not continuously employed before 13, though they lead a horse at harvest time, &c. younger. So far as this district is concerned, restrictions upon the labour of boys under 13, during half the year at least, would produce no effect, and it is thought better that boys should not engage as regular plough drivers before 12 at any rate.

Wages, paid fortnightly, are 12*s.* or 11*s.* with three pints of beer a day; at corn harvest meat and beer are given for a month; at hay time most give food for overtime; piece work is usually taken by strangers, which is partly due to the want of sufficient cottages for the cultivation of the land.

191. STATEMENT by Mr. Timotheus Burd, estate agent, Shrewsbury, to show the number of cottages for agricultural labourers, the average amount of land attached, the average rent, and the acreage on seven estates, comprising upwards of 20,000 acres, within 20 miles of Shrewsbury, 1869.

Total -	229	—	—	49	—	—	278	20,875	—

The foregoing statement comprises all the farms above 30 acres each, and lands in hand, and wood lands on the several estates referred to, and all cottages occupied by agricultural labourers.

Houses occupied by blacksmiths, carpenters, masons, shopkeepers, and artificers are not included, nor are tenements above five acres and under 30 acres. The occupiers of these houses and tenements contribute little, if any, labour to the farmers, and they seldom require additional labour themselves, beyond that afforded by members of their own families.

The wages of labourers vary from 10 to 12 shillings a week with a small allowance of beer in some cases, and generally with meat and beer, and an addition to money wages, for about a month in harvest time. The wages are paid weekly, or at periods not exceeding a month, and in cash.

In addition to cottage labourers, farmers generally keep one and sometimes two indoor men servants at yearly wages to take charge of the garden and hack horses, and to assist occasionally in the work of the farms.

Women are employed at intervals on the farm, "at the harvest, &c.," but not uninterruptedly, or for long periods; the wages about 10*d.* per day. Boys are often employed, but seldom under 10 years of age.

The cottages generally contain a dining room or kitchen, a small scullery or washing room, and pantry, with two bedrooms above. Some cottages have three bedrooms, and some one only, but these are exceptions; a privy and pigstye is appended in most instances. Water is obtained usually from a pump on the premises, but in other cases from wells or streams near.

Many of the cottages have been newly erected or put into substantial repair within 20 or 30 years (and are built with stone of the district or bricks with tile or slate coverings), and although some others require improvement, or to be rebuilt, the majority are substantial and comfortable, as far as the accommodation afforded; there is a great desire on the part of most landlords to improve the condition of the cottages on their estates.

By the foregoing statement it appears that on an average the cottages for agricultural labourers are in the ratio of about one for every 75 acres; this we think a fair proportion; a greater number would probably create a supply of labourers in excess of the demand, and tend to lower the price of wages.

The cottage tenants (with few exceptions) held directly from the landlord, but the farmers are allowed to recommend labourers whose characters they approve as the tenants.

192. Summary of answers in other returns.

Women not regularly employed in outdoor work, but considered useful during parts of the year; all but two deprecate any restrictions, except on girl labour.

Boys are employed regularly from 10 and upwards in three cases, in two only at 13, and in the rest about 12 years of age; in most returns the time of bird-minding is especially excepted.

The majority of returns approve restrictions on boy labour up to 12 years of age.—[E. S.]

193. Evidence of the labouring class from North Shropshire.

(*a.*) Waggoner, Stanton.

Wages 12*s.* and three pints of beer a day.

Pays 3*l.* 10*s.* rent.

Has a month's food at harvest; has some potato ground, for which he pays 1*s.* 6*d.* a "rood" (perch); coal drawn for him.

Keeps two pigs, one to eat, "one for rent."

Objects to living in a "farmer's cottage."

(*b.*) Labourer, Hodnet.

12*s.*; no extras.

Piecework at harvest.

Rent of cottage (two bedrooms), 4*l.*

Has half an acre allotment at 10*s.*

[I found some men here sub-letting parts of their allotment.—E. S.]

(*c.*) Waggoner, Loppington.

12*s.*; no extras, except potato ground, for which he paid 2*s.* a "rood."

Task work only lasted a fortnight.

Rent, 5*l.* (two bedrooms).

(*d.*) Cowman, Alberbury.

Gets all his meat and 5*s.* a week in money.

Rent, 1*s.*; garden enough to set up four or five "butts" (two bushels) of potatoes.

No pig. Wife "leased" (gleaned) two bushels this year.

194. Evidence as to the effect of field work upon school attendance in the under-mentioned parishes.

Lydbury, North.—Occasional work begins at 7 or 8, increasing till 10 or 11, when schooling ends.

Clun.—Leave at 10 or 11.

Clungunford.—Irregular at 8 or 9. Few are kept over 12; they generally leave at 11, girls younger. Some are one mile from the school. Many families don't send their children. From one little hamlet, where there would be 20 to 30 children, none of them are sent.

Stokesay.—Leave between 11 and 12. Occasional work for a year or two before that.

Prees.—*Mr. Goffin*, Lower Heath School.—"This "is one of Lady Hill's schools for Lord Hill's tenants, "the others being at Manhamby and Peplow. By "payment of 1*s.* entrance the children get a free "education, and by payment of 1*d.* a week become "members of a clothing club. Field work interferes "a good deal, though absence for that purpose is not "strictly allowed without leave. Probably two months "in year would thus be lost. They leave us about "12 or 13 years of age altogether."

"Agricultural labourers' children seldom stay after 11. A good many stay after 10, but are irregular. Girls go to service at 10 or 11."

[There were 29 labourers' children out of 75. The two shown me in the first class both lived in one-bedroomed cottages.—E. S.]

Hodnet.—"Boys leave about 11. Before that they are taken away only for a few weeks at a time. Leave is asked. Girls leave about 13. They are clothed free of expense while at school."

Stanton.—"Boys leave at 12 or 13. Before that they are irregular. Some come three or four miles to school. Girls leave about the same age."

[Here too special inducements were offered.—E. S.]

Wem.—Distance is a difficulty; a good many children come a mile and a half to us, and so do not begin to come till 6 or 7 years old. There are few children not attending some school. Boys are generally kept till 11 or 12, before which they are little employed. The boys of paupers are generally required by the guardians to go out at 9 or 10. Girls leave a year younger for small places.

Loppington.—The majority of boys leave school between 11 or 12, some at 10. Before this, even at 8, they are taken away for occasional work, sometimes as much as six months in the year.

195. Night schools existed in winter in five parishes out of 23.

At West Felton, the *Rev. R. K. Haslehurst* says, "It is impossible to conduct an evening school with "effect, unless there is at least one *paid* teacher. It "is very desirable that the clergy and educated laity "should help, but you must not depend upon them; "there must be at least one paid teacher. The "master has already had plenty of work in his day "school, without adding to it. The addition of the "evening school must have either the effect of work-"ing him beyond his strength, or of causing him to

Shropshire.
Mr. Stanhope.
g.

" omit that personal and constant superintendence of " bad pupil teachers, which is so necessary for them. " The difficulty is to find funds to pay him. More- " over, those who most value the evening school are " generally those who (comparatively speaking) least " want it."

The *Rev. W. H. Egerton*, rector of Whitechurch, says, " the evening school in my parish has given way to evening classes, which we find more profitable. The classes are held twice in the week. We had an evening school for several years. It consisted of three classes of pupils: (1) the best of the week-day scholars, anxious to make the most of the opportunity; (2) the children who had neglected school; (3) some adults desirous of improvement. The first scarcely needed it. The second looked upon it as a sort of premium on their previous neglect. The third were not numerous. There was great difficulty about finding good teachers. The work in fact fell upon the clergy. We thought that teaching monysyllables to those who had neglected our good schools four nights in the week, occupied more time than could be consistently given to such work. The evening classes are most satisfactory in every respect."

196. Evidence as to the condition of the cottages in 24 parishes :—

LYDBURY NORTH.

Population - 1,025.

Rev. C. Rolfe.—Accommodation is in most cases too small where there is a family. Some with three bedrooms have lately been built by Lord Powis. Few of the rest have more than two bedrooms, many have one only, sometimes partitioned, sometimes not. Lodgers are common. Nearly all have gardens. Rents, from 1*s.* 6*d.* to 2*s.* 6*d.* a week.

[In this and some of the adjoining parishes there was great complaint of the privies and pigsties being put up against the wall of the cottage.—E. S.]

HOPESAY AND ASTON.

Population - 676.

Rev. R. E. Haymes and *Mr. W. Downes*, registrar. —Very scarce. There are some very bad ones with one bedroom, especially those built upon the waste. Four or five new ones have been built. Rents, 4*l.* to 6*l.* No allotments. Potato ground on the farm is charged for at 16*s.* a chain.

CLUN.

Population - 1,758.

Rev. C. Warner.—Generally very bad, and very little improvement is taking place, except by Lord Powis. Probably from half to two-thirds have one bedroom only; some of the very worst with one bedroom and a small garden let for 5*l.*

Mr. W. Downes.—The roof in many cases slopes down almost to the floor; the windows are very small, and not always made to open. Most of them have privies; but in a few cases there is one only to every two or three.

NEWCASTLE.

Population - 580.

Rev. H. Creswell.—Nearly half have only one bedroom, about half have two, and a few have three. Water supply, drainage, and gardens fair; outhouses insufficient.

CLUNGUNFORD.

Rev. T. O. Rocke.—Very exceptionally bad and dilapidated. Some few are freehold, and are the worst; but they mostly belong to the landowners. Many have but one bedroom; and there is none occupied by a labouring man with three. Lodgers are common. There is no cottage to be got under 5*l.*, those with three bedrooms fetch 8*l.* or 10*l.* Few have no gardens.

CLUNBURY.

Mr. W. Downes.—The old cottages are wretched, almost all with one bedroom, with the roof sloping down to the floor, and the windows small, and not always made to open. Some good new ones built by Lord Powis, at Kempton, otherwise there is very little improvement taking place.

EDGETON AND HOPTON CASTLE.

Mr. W. Downes.—Rather better, but the outlying cottages in lone places are miserable.

WISTANSTOW.

Population - 1,121.

Rev. E. C. Swainson and *Mr. J. Taylor.*—In a sad state. In almost every case the second bedroom (if there is one) is a passage room. Eight or 10 new ones have been built. Privies and wells bad, and inspection much needed Almost all have gardens. Rents, 4*l.* 10*s.* to 5*l.*

STOKESAY.

Population - 559.

Rev. J. G. La Touche.—The cottages are in a most deplorable state hereabouts, and especially in this parish. This is the cause of demoralization. They are mostly the property of the landowners, and (except Lord Craven's) are let with the farms. In some cases they are almost like pigsties, with only one bedroom, and a kitchen under. Of late Lord Craven has been improving, and has built some two-bedroomed cottages.

All have gardens. The rents are very low, about 3*l.* 10*s.* for a cottage with a quarter of an acre of garden. This is on Lord Craven's and Lady Windsor's property. The rents are higher under small proprietors.

In Stokesay parish, which I imagine is an average parish in this respect, there are 123 houses, and the state of the cottages is shown by the following table :—

Proprietors.	Cottages with One Bedroom.	Cottages with Two Bedrooms.	Total.
A. - -	19	25	44
B. - -	9	2	11
C. - -	1	6	7
Various -	7	29	36
Total -	36	62	98

In most of the cottages with two bedrooms, the second is a lobby at the top of the stairs. In 14 the average size of the single bedroom is 11·2 feet square.

BISHOP'S CASTLE.

[For this, see post, No. 198.—E. S.]

KINLET.

Population - 450.

Rev. E. G. Childe.—Not sufficient; most have two bedrooms and gardens. Rents, 2*l.* to 3*l.* " I hold " strongly on the practical working in this parish, " that farmers are bad landlords."

NEEN SAVAGE.

Population - 450.

Rev. C. R. S. Cocks.—Sufficient, but generally very bad; same have only one bedroom; all have gardens; most are let with the farms. Rents, from 2*l.* 10*s.* to 4*l.*

PREES.

Population - 3,097.

Ven. Archeacon Allen.—The mass have two bedrooms; some are in a bad state of repair; too many

have one bedroom only. On Lord Hill's property great improvement is taking place. Rents, 3*l.* to 6*l.* [For details, see post, No. 199.—E. S.]

WHIXALL.

Population - 938.

Rev. John Evans.—Not sufficient, and high rents are paid for some cottages unfit for human beings to live in; wretched mud and timber walls, with one lower and one upper chamber, and the spring of the roof in several cases 14 or 18 inches from the floor. In all the ventilation is imperfect. Gardens more general.

HODNET.

Population - 1,979.

Meeting, February 2nd, 1869.—As a rule, well situated. Not in a good state, as quantities have only one bedroom, generally a large one. It is doubted whether or not these constitute the majority. Mr. Percy has built some with three bedrooms, and divided the one bedroom into two in 30 cases at once. The second is almost always a passage room. All have gardens. Rents, 4 to 5 guineas.

STANTON.

Population - 648.

Mr. Hilditch.—Fair; some new ones built by Lord Hill, but a few have one bedroom only. All have gardens. Rents, 3*l.* 10*s.*

WEM.

Population - 3,802.

Meeting, February 3rd, 1869.—Almost all belong to small owners, and scarcely any are therefore let with the farms; they are not good. A great many have one bedroom only. Where there are two, the first is generally a passage room. Overcrowding is common; they are insufficient in number. Some of the neighbouring landowners have pulled down cottages, and many men have to walk two or three miles to work. Not always gardens. Rents, from 3*l.* to 5*l.* Very great improvement is thought to be required in respect of out-door nuisances. Some one ought to be compelled to report as to overcrowding and nuisances.

LOPPINGTON.

Population - 578.

Rev. J. W. Davis.—Some have one bedroom, gene- they have two, one of which is a passage room. They are in fair repair; all have gardens, some an allotment of land for a cow. Rents, 4*l.*

ALBERBURY.

Population - 1,918.

Mostly rebuilt by Sir B. Leighton. They contain generally two bedrooms, one a passage room; gardens common, and many allotments of land for a cow. —[E. S.]

MIDDLE.

Population - 844.

Scarcely sufficient. They belong partly to small owners, partly to landowners. Some are very bad, and contain only one bedroom for a family, but they are improving. All have gardens, and let from 2*l.* 10*s.* to 5*l.*—[E. S.]

ELLESMERE.

Mr Shingler.—Generally not very good, and small; insufficient in number, much overcrowded, and badly ventilated in most places. Gardens general.

WHITTINGTON.

Population - 1,500.

Rev. W. W. How.—Chiefly belong to landowners, but there is one instance at least of tenants being obliged to deal with a tradesman landlord. They are fairly good, usually with two bedrooms. Some belonging to small owners are small, but there are not many with only one bedroom. Windows made to open, though there are exceptions to this. Most have gardens. Rents, from 4*l.* to 6*l.*

WHITCHURCH.

Population - 6,093.

Rev. W. H. Egerton.—Round here there is great complaint of scarcity for farm labourers. Numbers of men go two and three miles to work every day. It wears them out. There is also great complaint to be made of the small accommodation in them and of the small garden.

Mr. W. Hassall.—The majority are thatched, with one living room and small scullery, and one or two bedrooms. The new are brick and slate with two or three bedrooms. One-third are owned by landowners. Rents, 3 to 4 guineas.

197. [In only one parish visited was the "allot- "ment system" existing. At Hodnet some of the heath land has been inclosed and let in allotments of half an acre each; this was done by Mr. Percy "because of the high rent charged for potato ground "by the farmers." They are allowed to plough and sometimes hire labour to cultivate it.

Mr. Minor, chairman of the board of guardians at Drayton, thinks this half acre not too much for a man to cultivate properly if it adjoins his house. The ploughing is often done by the master, so that most of the labour required can be done in extra hours, and the man would only be required to give up a few days of his regular work. The straw from the corn grown upon half the ground and from his gleanings will supply him with enough manure.—E. S.]

198. Notes of visit to the agricultural labourers' cottages in Bishop's Castle, February 15, 1869.

The first visited, a little over nine feet square, one room below, one above, no backdoor. A little bit of garden. Rent, 1*s.* 6*d.* a week. Husband a "bas" (bastard) child; wife, G's daughter—the daughter of the man, not of the woman. The next contained a waggoner, who, with his wife, grown-up daughter, and one child taken in to nurse, had a very small cottage. Room up stairs divided into two, one window not being made to open. Rent, 1*s.* a week.

Then followed a group of six cottages, water supply deficient, and only one privy to the whole group. They belonged to a small owner.

(1), with one bedroom, contained husband and wife and five children.

(2), with one bedroom, husband, wife, and four children.

(3), with two bedrooms, no back door, contained husband, wife, and four children.

(4), with one bedroom, contained a single woman and three children.

The gardens attached to these were only a few feet square. Rents, 1*s.* 9*d.* a week.

(5), with two bedrooms, man and wife and four children. Rent, 5*l.* 10*s.*

(6), with two bed rooms, man and wife and two or three children.

I next visited a block of six cottages, belonging to a small owner, the only one almost in the place which showed any sign of recent improvement. Each had two bedrooms and good large windows.

Then I saw a double cottage belonging to one of the great landowners, built of stone. Each had one room above and one below. One contained a family of nine in all, the other one of six in all. Good gardens were attached.

199. Notes of visit to the cottages of Prees, February 1st, 1869.

A row of three, all with one bedroom; rent 4*l.* In the first two the bedroom window was very tidy, roof open to thatch, and sloping down almost to the floor; no back door; pigsties close to wall under bedroom window. They contained (1) husband and

Shropshire.
Mr. Stanhope.
g.

wife, an old woman, one girl, and a young man; (2), which was worse, husband and wife, five children, and two lodgers; (3), with a very rotten roof and staircase, husband and wife and five children.

Then came another row of three very old ones. (1), with two bedrooms, husband, wife, and two children; rent, with three acres of land, 14*l.*; (2), with two bedrooms very bad and ruinous, man and wife, his father, and seven children, rent 4*l.* 10*s.*; (3), with one bedroom, worse, husband and wife, and two children, rent, 4*l.*

We next came to a pair, one with two bedrooms at 4*l.* 10*s.*, and one with one only at 5*l.* Small families in both.

Two cottages belonging to a large landowner came next. (1), with two bedrooms, fair, unceiled, four children in the family; (2), very bad, with one bedroom; two young daughters and a son lived at home. Last year another was confined of an illegitimate child here.

Then a block of two with two bedrooms each, rent 4*l.* 5*s.* The first contained man and wife, his mother, two grown sons and daughters.

Next, two cottages with two bedrooms, at 4*l.* 10*s.* (1), five children at home; (2), no children, two beds in one bedroom, the second kept for the children when on a visit.

The next two, let at 5*l.* 5*s.*, were fair, and contained two bedrooms each. In the first I noticed, as an exceptional case, that the second bedroom was not a passage room.

Staffordshire.

STAFFORDSHIRE.—EVIDENCE.

199 (*a*). STAFFORDSHIRE CHAMBER OF AGRICULTURE.

A meeting of the Staffordshire Chamber of Agriculture was held on Saturday, February 13, and as it had been arranged that the Hon. Edward Stanhope, Assistant Commissioner, was to meet the Chamber, there was an unusually large attendance. The Earl of Harrowby, the president, was in the chair; and amongst those present were the Earl of Lichfield, the Hon. and Rev. A. C. Talbot, Mr. Thomas Neville (the vice-president), the Rev. R. W. Essington, Mr. Harvey Wyatt, Mr. R. H. Masfen, Mr. May, Mr. Parr (Alrewas), Mr. Edward Knight, Mr. Stacey Norris, Mr. Collins (Aston), Mr. J. Brawn, Mr. C. Byrd, Mr. C. R. Keeling, Mr. J. Carrington Smith, Mr. Perkins, Mr. S. Byrd, &c.

Mr. Stanhope having opened the subject, it was, on the suggestion of the Chairman, agreed to take first the question of the employment of women, and, with a view to excite discussion, his lordship threw out, but not as expressing his opinion, the proposition "that the employment of women in fields should be "entirely forbidden."

Mr. T. Neville said in that county young women were seldom employed in fields, but almost entirely as domestic servants. The women who worked on the farms were employed from about April and through the summer in weeding, haymaking, and such light work, and after harvest occasionally with the thrashing machine, cutting turnips, and so on. In that way a woman would add 3*s.* or 4*s.* a week or more to the wages of her husband, and the homes of such industrious women were invariably the best. (Hear, hear.) They got up early and prepared breakfast before they went out; they got home for an hour at dinner, and were able to return to prepare their husband's supper, their children being at school whilst they were at work. Women with small children did not as a rule go to field labour, if they did they left their children in the care of a neighbour. His experience was, that assisting with a thrashing machine was not objectionable work for a woman. They did not go early, the work was light, and he knew of no case of accident from their dresses. Mr. Neville proposed "That it is "not desirable that there should be any restrictions "upon the employment of married women in agri- "culture."

The Hon. and Rev. A. C. Talbot said as a clergyman he could not disguise from himself that the employment of women with young children had a deteriorating effect upon the children, and he thought that mending and making clothes, and the preparation of the meals of the husband, the bread earner, where in such cases so much neglected that nothing really went into the pocket as the result of such employment. (Hear, hear.) In the case of women, however, without children, or whose children were grown up, he saw no reason why they should not assist in the bread earning of the family. He believed that the labour to which women were put was not unsuited to their strength, whilst it was most important to the farmer. (Hear, hear). Those who lived in the neighbourhood of a mining district knew the great difficulty of procuring labour. In his own parish, when a young man left the farmer's house he generally left the place, and he did not know how the places of the labourers who were getting old were to be filled up. (Hear, hear.) He had a steam engine at work every day, and an elderly woman attended to it, fed the mill and the cutting machine, and did it better than any man in his employ, and her petticoats no more interfered than a man's smock frock. Mr. Talbot seconded the proposition of Mr. Neville.

Mr. Brawn objected to the resolution being limited to married women. As a rule girls were employed in the houses, but it would be cruel to forbid any who were unsuited for domestic service getting their living in the fields. He proposed to strike out the word "married," so as to make the resolution affirm that it was undesirable to interfere by legislation with the labour of women.

Mr. R. H. Masfen took the same view. He employed three women, and paid them from 13*l.* to 15*l.* a year; and he wished to know how the loss of such earnings to the labourer was to be compensated? He quite agreed that it was undesirable for women with small children to go out to work, and did not think it often occurred. He would not prohibit the employment of young single women in the fields. One of his workmen was a widower, and his daughter kept his house, and in the summer she got almost enough in two months or ten weeks to buy her clothes.

Mr. Perkins, Mr. Shaw, Mr. Parr, Mr. May, and others spoke to similar effect, and Mr. Mein also made some remarks.

Mr. Neville, with the assent of Mr. Talbot, amended his motion so as to make it of general application, adopting the following terms:—"That there is "nothing in the system of agriculture as pursued in "the county of Stafford which requires legislation "for the restriction of female labour in agriculture, "and that such legislation would be injurious to the "employers of labour, and to the labouring classes."

The Chairman observed that there was this great distinction between town and country, that in towns there was as it were a great bank of labour available as special demands arose from time to time for labour in particular branches; but in the country, where perhaps to an area of 4,000 acres there would be only some 400 or 500 people, there were no resources from which to draw an additional supply for any pressing

necessity, as harvest, nor was there accommodation for additional persons if they could be brought to the places where they were needed; hence the necessity of employing women and children to meet emergencies. He thought any attempt to interfere with the labour of women in the country would create evils, because it could not be adapted to meet the variety of circumstances adverted to, and he thought any abuses connected with it would be best prevented by the growing public opinion against anything which was of an evil tendency, and which would admit of the adaptation of arrangements to the actual necessities of the case far better than any legislative plan could. (Cheers.)

The resolution, as amended, was then unanimously agreed to.

In response to the invitation of the Chairman for some proposition as to the restriction of the labour of children,

Mr. Carrington Smith proposed "That no child "shall be employed for day wages under 10 years "old, and that between 10 and 13 no child shall be "employed for more than half the year, unless he or "she shall have previously passed an educational "examination to the satisfaction of one of Her "Majesty's inspectors."

Mr. May thought the labour of children under 11 was of no value, except in bird tenting, dropping beans, and such like work. He proposed, as an amendment, "That no child should be employed "under 11, and after that age that no restriction "should be imposed."

Mr. T. Neville seconded the amendment, considering that by the age of 11 boys could obtain a satisfactory amount of instruction. If there were to be any restriction afterwards, he would prefer that it should take the shape of a certificate of possessing a certain amount of instruction.
